

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

Illustrated Magazine Number for January

Outlook Life-Insurance C

A Progressive Idea: A Limited Membership: An Unmatched Opportunity for a fortunate few who act promptly.

PURPOSE OF THE CLUB: The OUTLOOK LIFE-INSURANCE CLUB organized for the following purposes:

1st. To promote, among OUTLOOK families, home-safety and personal thrift by en prudent insurance investment.

2d. To teach, in an interesting and unconventional way, the principles and benefi class life-insurance.

3d. To provide Club members—men, women, and young people—with the be Endowment Policies on *easy monthly deposits*, thus enabling many OUTLOOK r take insurance who would not otherwise feel that they could do so.

SEE HOW EASILY YOU MAY BECOME A MEMBER

If you are an OUTLOOK subscriber (more than fifteen years of age) and are in go and able to save *a small sum* each month, you, *and other members of your family*, advantage of the benefits of Club membership, no matter where you may live. The of this financial fellowship are as wide, geographically, as the circulation of THE OUT

THE INSURANCE COMPANY which issues the Club Policies is consi many to be the world's strongest and best. It has more than $300,000,000 of a more than 400,000 policy-holders. For more than half a century the wisest financi been placing their money in its care.

WHAT OUR MEMBERSHIP MEANS TO YOU

If you are accepted as a member of the OUTLOOK LIFE-INSURANCE CLUB you b once an investing partner in the above impregnable financial institution, and rece share of the cash profits of its world-wide monetary enterprises. Your Policy guar you a cash estate whether you live or die. Your money is neither risked nor sper absolutely safe and profitably invested. If, after the second year, misfortune or comes, your Policy may be counted on for immediate aid. In 20 years, if living, *you is handed back to you with interest.*

TERMS OF PREMIUM DEPOSIT

Club members are divided into two classes—Class A, consisting of members havi cies for $1,000 each; and Class B, consisting of members having Policies for $2,0 Members in Class A deposit $5 down and then *a small amount* monthly for 10, 1 months (according to age) until the first year's premium is cared for; members in Clas posit $10 down and a proportionately larger amount monthly for the same period. Th year premium deposits are made to the Secretary of the Club, who turns them over Insurance Company. The premiums for the second year, and all subsequent years, posited by Club members directly with the Insurance Company either quarterly, semi-a or annually, as they may elect. The Club Policies are exactly the same as those regularl by the Company: they give you every modern insurance advantage and are furnished Company's usual rate. The Club's convenient instalment plan does not add an extra

While this Club offer remains open, Policies for even larger amounts can be specially for members who so desire—write us about it.

HOW TO JOIN

Send for particulars and application for membership.

OR, *better yet*, Send your first deposit ($5 or $10) immediately and make sure of r tion. Make remittance payable to the order of the Club. The deposit will be retu your Policy is not issued. When you write BE SURE to state exact date of birth.

PROMPT ACTION NECESSARY

This is the first time that the door of highest-grade Endowment Insurance has op the knock of a five-dollar bill. The opportunity afforded by our Club is exception cannot remain open indefinitely for reasons which cannot easily be stated here but wh will explain by letter. You will readily see why you should act *at once* in order to rece important benefits of Club membership.

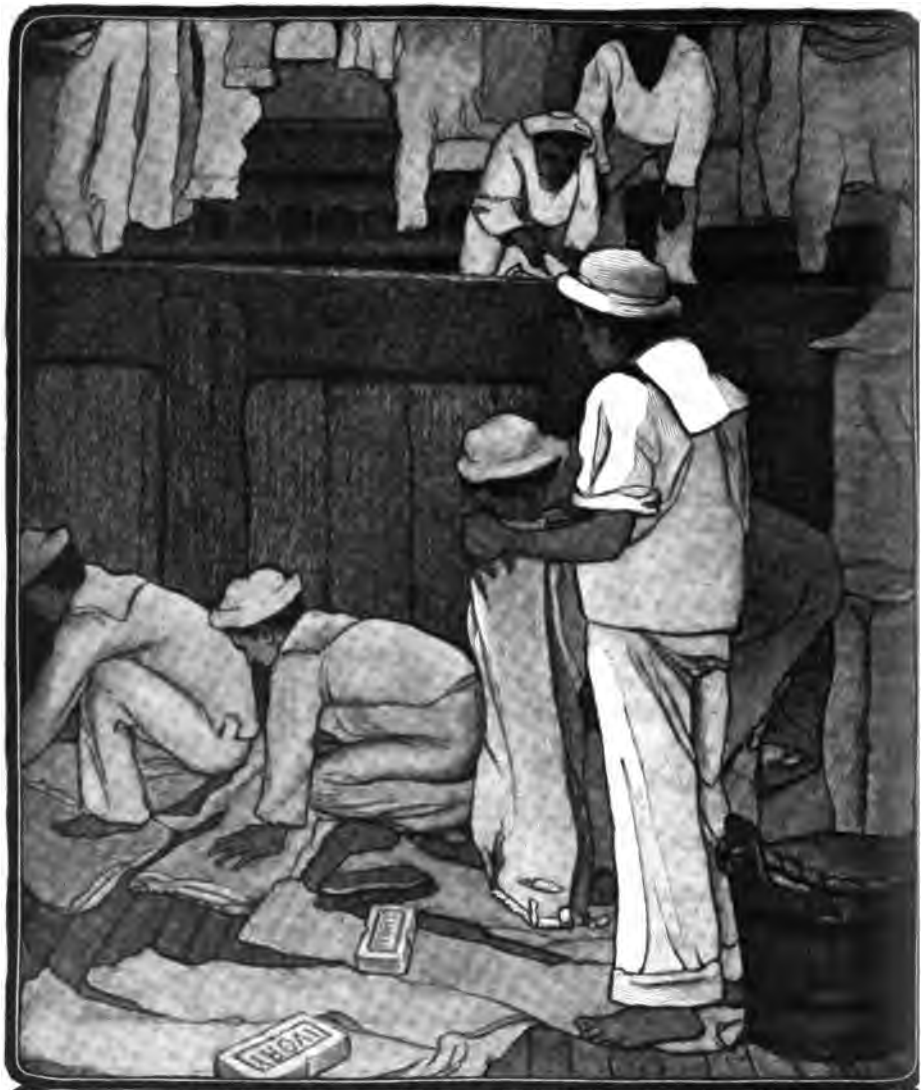
The Outlook is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The first issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

Price.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

Postage is Prepaid by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila Samoa, Canada, and Mexico. For all other countries in the Postal Union add $1.56 for postage.

Change of Address.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

Discontinuances.—If a subscriber wishes his copy of the paper discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.



How to Remit.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of THE OUTLOOK COMPANY. Cash should be sent in Registered Letter.

Letters should be addressed:

A Triumph for International Arbitration

A substantial gain for the cause of international arbitration, and therefore for the world's peace and advancing civilization, is found in the agreement to submit the Venezuelan dispute to the Hague Tribunal. The willingness, one may even say eagerness, of all the parties concerned to submit the case to President Roosevelt was highly gratifying to our pride as a Nation, and was an honest tribute to Mr. Roosevelt's fairness, ability, and integrity. But of far greater importance than such considerations is the indorsement of the principle of arbitration through a permanently constituted international court. It may now reasonably be hoped that the time is at hand when disputes between nations will be submitted to the Hague Tribunal almost as a matter of course, and that its scope and power may be greatly extended. In addition to this prime reason for congratulation it may be added that there are special reasons why arbitration by this country alone was not desirable in this case. In a sense the United States is indirectly involved in everything connected with South America, and it is better that it should not be asked to adjudicate questions relating to the right of interference by foreign nations in Venezuela for the protection of the property rights of their subjects; that it should not put itself in danger of being regarded by foreign Powers as a police force to aid in the collection of debts for them in South American countries; that it should not, by a possible adverse decision, make itself disliked in the South American countries over which, in an international sense, it must exercise some right of guardianship; and that it should not, through a judicial decision, pass upon what may be its own future action. The exact points to be adjudicated, as determined by the notes interchanged between Great Britain, Germany, Italy, Venezuela, and the United States, have not yet been announced; but it is understood that they will be included in a protocol which is now being arranged; that they will not involve in any way the Monroe Doctrine; that if Venezuela shows reasonable willingness to conciliate the Powers, and perhaps to furnish some kind of guarantee for the payment of an adverse award, the blockade now existing will be withdrawn before the investigation of the arbitrators actually begins. President Roosevelt and Secretary Hay have exerted a decisive influence in the negotiations which have led to the happy determination to refer the matter to the Hague Tribunal; and again they have deserved the praise and appreciation of the American people without regard to party. It is thought that our Minister, Mr. Bowen, may appear in the negotiations as the accredited representative of Venezuela, but not of the United States. The English papers pretty generally agree that President Roosevelt's course in declining to act as arbitrator was wise from his point of view and that of the United States, although from the English standpoint they regret it.——The week in Venezuela itself was an uneventful one when it is considered that, theoretically at least, a state of war exists. The blockade is being enforced, but apparently with mildness as regards neutral vessels. For instance, the mail steamship Caracas, plying between the United States and Venezuela, was allowed to land mail and passengers at La Guayra, although it was compelled to leave the harbor immediately thereafter. There have been no hostilities of any kind; and both President Castro and the commanders of the foreign forces now in Venezuelan waters are evidently trying to maintain quiet and avoid collision

until the diplomatic negotiations are completed.

❀

Cuban Reciprocity

If the New York "Times" correctly reports Senator Burrows, of Michigan, he affords a striking illustration of the unstatesmanlike tendency in certain quarters to leave the great National and even international questions to be decided by purely local interests. After saying that in his State there are sixteen beet-sugar factories, representing a stock valuation of $12,000,000, and that the beet-growers are going on January 8 to hold a convention to decide whether a reduction of twenty per cent. on Cuban sugar will seriously injure their business, he proceeds as follows:

> In case the decision of the beet-growers shall be that the ratification would be injurious to their industry, I do not suppose any Republican who advocates the protective tariff will support the treaty. It is not to be assumed that a treaty would be ratified providing for the easier entry of certain American manufactures into Cuba at the sole expense of another industry of this country. This is not the reciprocity contemplated in the Republican National platform.

To see a Senator of the United States practically abdicating his function, which is to legislate for the whole Nation, and leaving a convention representing one industry, in which his constituents have a special interest, to determine for him how he shall act and vote in the United States Senate, is not an altogether admirable spectacle. It will seem to most readers of the press—we should think it would seem so to the beet-sugar growers of Michigan—to mark a decided deterioration from the days of Webster and Clay and Cass. General Cass was not a great man; but he would hardly have notified the public that he was waiting till a convention representing $12,000,000 worth of stock held by his constituents told him how to vote. He would have been more likely to go to the convention when it met to tell them what their interests, bound up as they are with the interests of the whole country, required.

❀

What Cuban Reciprocity Means

Cuban reciprocity means a great deal more than Senator Burrows seems to imagine. The question before the Senate is really simply this: Will the American people, having emancipated Cuba, set for themselves the task of making it an American community, with all which that implies; or will they leave Cuba a Spanish-American community to retrograde to the condition of Hayti? The real prosperity of a people depends far more upon their industry than upon their politics; and their politics is largely important for the bearing which it has upon their industry. The welfare of every man is bound up with that of his neighbor; the welfare of every community is bound up with that of its neighboring community. If we attach Cuba to us by commercial ties, if we extend our arterial system to her, so that the life-blood of commerce will flow freely back and forth between her and America, American capital will go to Cuba, Americans will migrate there, the population will increase in number and improve in quality, the same transformation will be effected there that was effected in Louisiana, and there will not be slavery to retard the process. In contrast with the provincial $12,000,000 policy of Senator Burrows, we put here the statesmanlike view of General James H. Wilson, in his address delivered last October before the Commercial Club of Chicago. We quote from it a few sentences. The whole speech is well worth careful study:

> The simple fact is that Cuba does not come to us as a beggar, but with full hands, asking us for fair exchange, which will not only enrich her, but add greatly to our own prosperity. It has been stated that of every ten dollars we enable her to make out of her products, she will for years give us nine as profit upon the goods she will take from us in exchange, and I believe that this statement is within the limits of probability.
>
> . . . . . .
>
> But when I consider our own commercial and political interests in Cuba, I am fully persuaded that it would pay for us to go still further, and, anticipating the annexation of Cuba, which must come in the end, give her at once absolute free entry for her natural and manufactured products into the United States, in exchange for free entry for ours into Cuba under the protection of a common tariff as against the rest of the world.
>
> . . . . . .
>
> This absolute freedom of inter-State trade we think of too little and value too lightly. It lies at the very foundation of our National prosperity and glory, and we owe to it much of our preponderating influence in the commercial world. If granted to Cuba by treaty or by an Act of Congress, it would do more, in

my judgment, than any other measure which could be devised to extend our foreign trade, and not only to enrich and make Cuba prosperous and happy, but to fill her up with Americans, and thus hasten her preparation for incorporation into the Great Republic.

What statesmanship calls for is a treaty with Cuba by which she would leave America to determine all her foreign relations, including her tariff system, and America would take down all tariff barriers between her and America. Whether political annexation is ever to come, it will be time enough to consider by and by. Commercial annexation might well be perfected to-day. True statesmanship would endeavor to make Cuba at once American, in her industry, her schools, her liberties. No real or imagined interests represented by $12,000,000, or any other amount, should be permitted to stand in the way of such a consummation.

The Police in New York

The organization and administration of the police in New York City is a matter of more than local interest, because it ought to furnish an object-lesson to other cities. For this reason the report of the special Commission, consisting of ex-District Attorney Philbin, Colonel Partridge, and General A. D. Andrews, made to Mayor Low last week, recommending certain elements in a reorganization of the police, deserves general consideration, and those who have to do with police organization in other municipalities would do well to secure this report in full and give it careful reading. The Commission—Commissioner Partridge dissenting—recommends the establishment of the three-platoon system—that is, as we understand it, the division of the police into three watches of eight hours each; a chief of the police to be placed in direct control of the force, under the title General Inspector; a single Police Commissioner, but with a term of office to be fixed at fourteen years, the Commissioner being irremovable except on charges made and proved; and, as now, the members of the police force to have the right of trial and dismissal and the right to appeal to the courts for a review of their cases after trial before the police tribunal. Most of these recommendations appear to The Outlook wise. The objections to the three-platoon system are well worthy of serious consideration, but the substitution of this for the two-platoon system is in the line of the modern movement for the reduction of hours of labor. The fact that it would require an increase in the police forces is not a serious objection. The fact that it gives longer rest and larger opportunities for the policemen in family life seems to us to outweigh the objections against it. We are doubtful about the recommendation that policemen should continue to have a right to appeal to the courts for the review of their cases when the decision of the police tribunal is against them. These appeals in the past have had the effect to reinstate on the force, on technical grounds, men who had been discharged for good and sufficient reason. This right of appeal has also the effect to weaken discipline by depriving the head of the police force of power to discharge except in cases where legal evidence admissible before courts of law can be secured. It appears to The Outlook that some modification of the methods of military tribunals in the army would be an improvement on the present system. On this subject, however, The Outlook must report that the general judgment of experts, including Mr. Philbin, the former District Attorney, and Mr. Jerome, the present District Attorney, and including also all the members of the Police Commission, sustains the proposal that justice requires a continuance of the system of appeals from police tribunals to the courts. The ground of their judgment is thus stated:

> To intrust the removal of members of the police force, without an appeal to the courts, to such police officials as we have sometimes had and may again have, would be to make it possible for a corrupt head of the department to exercise a tyranny that would create a demoralization most detrimental to public welfare. Experience has shown that the courts have only failed to sustain the Commissioner where it was manifest that serious errors had prevented the accused from having a fair trial.

The New Police Commissioner

Almost simultaneously with the report of this presentation to the Mayor comes the resignation of Commissioner Partridge, and the appointment of General Francis V. Greene in his place. General Greene will bring to the office

military experience, a large knowledge of men, and familiarity with the city and its wants, and it is said that he made the condition of his acceptance a change in the law, in accordance with the recommendation of the Police Commission, fixing his term of office at fourteen years and making him irremovable except on charges. We shall look with interest to see whether he is able to overcome the serious defects in the police administration of New York City, without greater power of discipline than the Police Commissioner now possesses. We shall be surprised if he is able to do so without a change in the policy of municipal administration for which the Commissioner is not primarily responsible. The enactment of laws against vice, and particularly against liquor-selling, by the general sentiment of the State, the enforcement of which would be contrary to the general sentiment in the city of New York, has led to the adoption of a policy of enforcing the law in some cases and not in others, leaving the police captains to determine when they should and when they should not enforce it. Such a policy is fatal to discipline and often to honesty, and is a prolific source of blackmail. If the laws against vice are to be enforced only when the violation of them becomes a public nuisance, the principle should be clearly enunciated by the Mayor, and the responsibility should be assumed by him. We do not believe that any Commissioner can prevent the police from being co partners with vice by sharing its profits, unless either the Legislature changes the laws against vice, so framing them as to make them possible of impartial enforcement, or the Mayor and Commissioner combine in a policy, frankly avowed, which shall clearly and intelligibly define the extent to which and the limits within which the police can be called on to enforce the present laws.

❀

Overcrowded Street-Cars

Americans have long been the greatest street-car riding people in the world, and this form of National extravagance—or economy where time and strength are money—has been greatly developed during the past few years of financial prosperity and street-railway expansion. In New York City, where business is mainly in a congested center and the new trolley lines have merely brought more distant suburbs within easy reach of this center, the result of the extraordinary growth of street-car travel has been to produce an overcrowding of cars altogether intolerable. During the holiday season the annoyance to which women were subjected stirred the whole city, and the energetic Merchants' Association and the Mayor demanded of the street-railway companies a series of reforms by which the situation should be relieved. Mayor Low put the emphasis of his demands upon the surely practicable expedient of running as many cars throughout the day as are run during the "rush hours," and with this demand for the public he coupled the demand that the motormen on the trolleys should be protected by vestibules. When horses were used, he pointed out, the companies had an excuse for not vestibuling the front platforms, but with the substitution of electric power the vestibules can no longer be in the way. The Merchants' Association added to these demands a very sharp one calling for "accommodation for every passenger, or the enforcement of a 'no seat, no fare'" ordinance. With the spirit which prompted this last demand we are in the fullest sympathy, but the demand itself is extreme. Passengers insist upon crowding on cars when there is nothing but standing room and hardly that, and it is not fair—even if it is constitutional—to require the roads to carry them without pay. If anything is to be done along this line, it is much more feasible to adopt the suggestion of Mr. M. N. Forney's recent pamphlet on "The Overcrowding of Cars," demanding ordinances establishing the principle "no seat, half fare." Such an ordinance would be essentially fair, and although it would require elevated roads to provide conductors to give back half-fare slips to standing passengers, it would also speedily impel them to increase the number or size of their cars. Certainly the constitutionality of such an ordinance is not open to attack, as the company would have a greater profit from carrying crowded standing passengers at half fare than from carrying comfortably seated ones at full fare. The principle laid down by the Supreme Court of Iowa, and cited by Mr. Forney, fully

covers ordinances of this description. It reads as follows:

The court cannot undertake to guarantee the company any fixed or certain returns upon its investment. The exercise of such a power would work an utter destruction of the legislative right to regulate rates of water companies and other corporations operating works of public utility. We think the decisions have already gone to the verge of safety in nullifying legislative acts of this character; and to go farther and say that the courts will not only preserve property from confiscation and destruction by legislative power, but will also assure to its owners a definite and fixed rate of profit upon their investment, would be an act of judicial usurpation.

❀

Exorbitant Coal Prices

An aspect of the coal question that deserves immediate attention is that of price. The rich man's present annoyance and difficulty are as to obtaining coal at any price, while the wants of the very poor man have, to a considerable extent at least, been met by provision for the sale of coal in pails at a price not much higher than ordinarily prevails for this kind of trade. But there are a vast number of people who are unwilling to purchase their coal supply by the pailful, to whom, nevertheless, the increase from a fair to an exorbitant price is a very serious burden. It is understood that the operators and wholesale dealers are selling coal at not over $5.50 per ton for domestic purposes; but in New York the retail prices still reach $8 and even $12. Is there no remedy for this? Have the operators no public duty in the matter? It may be said that the retail dealers have a right to a larger profit than usual on account of their losses during the summer, and the cost and trouble of selling coal one ton at a time instead of the larger usual quantities; but, allowing for this, the margin of profit still remains not only large, but, in the opinion of many, extortionate. It is believed by those who understand the trade that the retail dealers depend upon the operators, and that in ordinary times the retail prices are largely governed by the operators' wishes. Now, it will be remembered that the operators have made certain public promises. In one interview Mr. Baer is reported to have said: "There will be plenty of winter coal here *at a fair price.*" On October 23 last Mr. Baer, in a letter to the general manager of his company, said: "Where dealers seek to obtain an unfair profit from the public, you will promptly take steps to supply the reasonable demands of the public *directly*," and still later it was generally announced by the press that the coal operators would open agencies in New York, if it were necessary, to bring the price of coal down to $6.50 per ton. It is not necessary to maintain that Government has a right to regulate prices in order to show that when an article of universal need is sold at exorbitant profit—running in this instance from $3 to $6 per ton—the rights of the people to secure the necessities of existence at living prices must be upheld in some manner.

❀

The Duty on Coal

One way of upholding the people's coal rights is to remove the duty. A correspondent in western Connecticut informs us that, "inspired by The Outlook's editorial [in the issue for December 20] on the duty of Congress and the duty on coal, citizens are circulating this petition in this and several other Connecticut towns:

"To the National Congress: We, undersigned citizens and voters, in view of the widespread want for coal in our homes, our factories, our schools, and our churches, and in view of the continued high prices of what little coal there is to be had, demand of Congress an immediate suspension of all duties on all coals from outside of our National boundaries, for a period of not less than six months. And that Congress shall do all in its power not only to make the importation of coal free, but also to encourage by all possible means its immediate importation to meet the serious needs of the people. We call upon our local member of Congress to present this petition immediately to the assembled Congress."

He adds: "Men of every class are signing with intense interest and the strongest determination that something shall be done. The signers are merchants, manufacturers, factory hands, professional men, and farmers. I have never seen anything of the kind taken hold of with such unanimity and intensity. The very politicians whom I thought might hesitate, for supposed prudential partisan reasons, have thrown all such feeling to the winds. A man whom I most expected to hesitate exclaimed: 'What! sign to suspend the duty on coal for six months? I would be glad to sign to remove such duty forever!'" The form of petition which our

correspondent sent us is a convenient one, and we hope that other communities will adopt the method which he describes of bringing the sentiments of the voters directly to the attention of Congress. It is well to write personally to individual Representatives and Senators, but it must be remembered that many citizens will sign a petition who will not venture to take the responsibility, or who cannot take the time, to write a personal letter. We have as yet to see a single sound objection made to the proposal that American citizens should be relieved, at least temporarily, of the illogical and—at the present moment—insufferable burden of being taxed for exercising their right to protect themselves against cold and disease.

The Child Labor Conflict at the South

One more Southern State seems to have responded to the appeal for legislation restricting the employment of children in factories. In Virginia the House of Delegates has passed an act prohibiting factory labor for children under twelve, and regulating the labor of those between twelve and fourteen. The Senate is likely to concur, and the influence of Virginia be put on the side of those who have so long been struggling for a similar law in Alabama and hope to see the fruits of their labors when their Legislature meets next month. Unfortunately, however, another Southern State nearer than Virginia has kept its influence on the wrong side—the Georgia Legislature having adjourned for four years without enacting the moderate child labor law demanded. As Alabama also now has a Constitution providing for legislative sessions only once in four years, the corporate influences opposed to restriction are likely to take courage from their success in Georgia and fight desperately in Alabama also against any restrictive measure, knowing that the defeat of the reform this year gives them four years more of license, and puts upon the reformers the necessity of keeping up an agitation during a long period when public attention is hard to arouse because no legislative action is possible. This obvious effect of infrequent sessions of the Legislature ought to be considered in the Northern States which are considering the proposed abandonment of annual sessions. Fortunately, we have no reason to fear that the Alabama reformers will abandon their agitation even if they are defeated this year. A recent letter from one of them says:

> I have just returned from a mill where the employees, children and all, are worked for thirteen hours a day—from 5:30 in the morning to 6:30 at night, with but twenty minutes for dinner. The same mill, when it is rushed, works its hands from three to four nights in succession until 9:30 and sometimes 10 o'clock.

Such exploitation as this of the physical strength of half-grown children, such deprivation of the pleasures of childhood and of the mental equipment needed for maturer years, are sure to touch the hearts of all who have no pecuniary interests in maintaining the false system, and the supporters of the reform know that they have only to continue their work to succeed. Our correspondent believes that the cause will also appeal to the consciences of those who are financially interested in maintaining the present system, and asks us, so far as we are able, to appeal to the New England stockholders in Southern mills to use their influence with their corporations on the side of humanity. "If," he writes, "the Northern men who are involved in these Southern enterprises will get squarely and explicitly on the side of legislation, every State in the South can have a child-labor law before the first of March."

Damages Awarded Against a Trade-Union

The consternation created in trade-union circles last year, when the House of Lords decided in the Taff Vale Railway case that a trade-union could be made a party to a suit, was increased last week when the jury, in a damage suit brought by the same railroad, awarded the company damages to the amount of $135,000 against the union to which its striking employees belonged—the Amalgamated Society of Railway Servants. Until the decision of the House of Lords last year, the historians of labor legislation in Great Britain had uniformly laid it down as a fundamental principle that a trade-union could neither sue nor be sued. In fact, Parliament had so carefully avoided any enactment compromising this principle that it was generally supposed to have adopted it in its full vigor.

In the case brought before the Law Lords it was only the right of a court to enjoin a union from a certain form of picketing that was directly involved, but the decision that the union as an association could be made the party to a suit carried with it the doctrine that the funds of such an association were liable to attachment in any damage suit that might be brought. In the case decided last week this doctrine was applied. The Amalgamated Society and its officials, including Richard Bell, M.P., have been found guilty of maintaining a system of picketing and terrorism to bring about a strike and prevent the employment of non-union men, and are held responsible for all damages resulting to the railroad from these actions. These damages, as before stated, are reckoned at 27,000 pounds sterling. In England the situation is likely to call for Parliamentary action defining more precisely just what forms of picketing a union may employ, and just what acts of individual unionists may be laid at the door of the organization. The English unions have always found Parliament much more friendly to them than the courts, and they naturally expect to do so again, but it does not seem likely to American observers that Parliament will give new sanction to the old doctrine that a union cannot be held legally responsible for its official acts. Certainly in New York State, under the code of civil procedure, "unincorporated associations consisting of more than seven members"—which have been held to include unincorporated trades-unions—can be sued through actions brought against their presidents and treasurers, and the property of the association bound by the judgments given. The general principle that there can be no power without responsibility is one to which no exception can be made in favor of the labor union.

A Hard Winter in Europe

In sharp contrast with the commercial prosperity here are the hard times now reported in the principal countries in Europe. In England the disbanding of the troops who served in South Africa has most seriously disturbed the labor market. Since the war came to an end 110,000 soldiers have been brought back. All these men have been thrown upon the labor market since August. Simultaneously there came slack times and lower wages in the great industrial centers of England and Scotland, especially in the engineering and ship-building trades. The various Government factories have also been dismissing men in large numbers since the peace, and as trade generally is showing some decline, the outlook for the industrial population is more gloomy this winter than it has been at any time since 1892–3. At that time the municipalities, at the instigation of the Government, found work for many of the unemployed, and it now seems probable that public works will have to be started to help the growing army of the unemployed over the present winter. While the war was on, it was expected in England that a large number of soldiers would settle in South Africa when peace was declared. The War Office took measures to facilitate such settlements. But the vast majority of the men whose periods of service ended with the war preferred to return and take their chances in the labor market at home. From July to September last there was a considerable working-class emigration to South Africa. There are, however, comparatively few opportunities for an industrial population in South Africa, and many of the men who went out from England are back again and are adding to the congestion of the labor market at home. Many more are stranded in the coast cities of South Africa, and in Cape Town the Government has had to take measures for the relief of these men. In Germany even darker conditions are depicted in the labor reports, though in that country the situation is neither complicated nor explained by returning troops. According to the quarterly bulletin of the New York Department of Labor—the best publication of its kind in the country—it was simply the "speculation and overproduction in certain industries" which produced the crisis. Significantly, this speculation and relative overproduction were most marked in the industries controlled by the great syndicates or trusts, which proved no better able than competing concerns to reckon the future market for their products. In Austria, according to a recent despatch from Vienna,

there are "in the iron trade alone one hundred and forty thousand men without employment. Many factories are closed or are running half-time. The authorities fear an epidemic of typhus and far-reaching famine." The Austrian despatch goes on to state that the industrial situation there is causing an enormous emigration to the United States, and our immigration reports here confirm this conclusion. Immigrants to the port of New York are more numerous than ever before, and the height of the tide is the measure not only of prosperity here but of relative adversity abroad. Even from the most selfish standpoint, the hard times abroad are matters for concern here. The army of unemployed there means decreased consumption of American goods, and lower wages there means cheaper production of manufactures to displace American products in the newly gained markets. The industrial world is one body, and a severe injury to one member has in time a weakening effect upon all.

❀

The Woman Question in Germany

Facts are increasing to show that in official circles in Germany a reaction has set in against further concessions in the woman question. In the Fatherland this problem is confined almost entirely to the departments of higher education and public service, and only to a very limited degree has it also a political aspect. Remarkable progress had been made, especially in the attendance of women at the universities. Here the high-water mark of 1,262 was reached one year ago, and even last spring a total of 1,029 was reported. Now only 737 women are enrolled in the twenty-one universities of the country, and the probabilities are that there will be a further decrease, as the authorities in a number of cases have assumed a hostile attitude toward the agitation. Notably is this the case in Berlin, where the conditions for admittance have been made more stringent, with the result that the enrollment decreased from 622 to 370 in a single semester. Still more significant is the fact that the University Senate, in response to a petition to admit women to university privileges on exactly the same footing as the men, has promptly refused to do this. This means that not only in Berlin women will not be matriculated, and can attend lectures only as "hearers" by special permission, but that probably the majority of these institutions throughout the country will follow the example of the leading Prussian school. As matters now stand, only the Duchy of Baden, with its two territorial universities of Heidelberg and Freiburg, will permit women to matriculate and take a degree with exactly the same conditions that obtain in the case of men. In all of the other universities women cannot become full-fledged students, and can be admitted to examinations only as a special favor. Baden has in general exhibited a marked degree of liberality in extending the privileges of its high schools to women, not only admitting them to its universities, but also to the regular gymnasium or secondary schools at Pforzheim and elsewhere, and even establishing regular colleges for girls, *e. g.* at Carlsruhe, leading up to the universities. In this latter respect it has been timidly followed by Oldenburg and one or two other smaller States of the German Empire; but as yet nearly all of the girls' colleges in Germany corresponding to the regular classical gymnasium and the scientific Oberrealschule for boys, of which colleges the best are found in Berlin, Leipzig, Breslau, and Hanover, are the work of private enterpri e. As long as the all-powerful State of Prussia shows so little inclination to make real concessions to the movement, but little permanent and tangible gains can be expected. And in Prussia the reaction is seemingly stronger than elsewhere. In Koenigsberg new restrictions were enacted that virtually exclude women from the medical department, and this example has been followed by Halle and Saxon Leipzig. It is rather remarkable that even where women can matriculate they make little use of this privilege. In Heidelberg, out of 70 women students only 16 are matriculated, and in Freiburg out of 43 only 18. A woman contingent is found at all of the German universities except the three smaller institutions at Greifswald, Münster, and Rostock, the attendance at the others ranging from 370 in Berlin to 2 in Tübingen. This same reactionary tendency appears also in the official decree of the German Imperial Government

directing that henceforth special care shall be taken not to employ weak women in the post-office and telephone departments, nor in the public schools, the statistics of recent years having shown that the physical condition of women only in exceptional cases permitted them to do their full duty in these callings, a fact probably explained by the rigorous demands made by the German Government on all of its officials.

❀

The Customs Union and South Africa

The conference on the Customs Union to be held early in the new year will be the first occasion on which there will be a meeting of representatives of the old and new British colonies in South Africa. Cape Colony, Natal, and the Free State were in a Customs Union before the war. The Transvaal had stood outside the Union, and had a tariff with many high duties which pressed heavily on the mining companies and on the commercial and industrial population of Johannesburg and the Rand. From May, 1900, all the Transvaal laws have been in force; although during this time the country has been under British rule. In October, however, the old tariff was revised and many changes made by proclamation issued by Lord Milner. Reductions were made in nearly every instance by these changes, for the revision was undertaken with the object of reducing the inordinately high cost of food supplies and of building materials imported from oversea. Everything except brick and stone which goes into a building in Johannesburg has to be imported from England, Germany, or America. Some idea of what this entails may be realized from a single instance. A barrel of cement which costs five shillings on the dock in London sells for thirty-eight or forty shillings on the Rand. The high price of food and the enormous cost of building material have formed one of the most pressing local questions confronting the High Commissioner since in July last people began to return to Johannesburg. It was to ease these conditions that the Transvaal tariff was revised in October. As it stands it is only a provisional tariff, and it will not be made permanent until after the approaching conference, at which all five colonies—Cape Colony, Natal, the Transvaal, the Orange River Colony, and Rhodesia—will be represented. Under the existing Customs Union the general rate of duties averages seven and a half per cent. None of the South African colonies has any other productive industry than mining. There is no protection to any industrial interests in the existing tariff; but the Dutch farmers of Cape Colony have adequate protection for home-grown produce, and they have also preferential rates on the railroads, which add considerably to the protection afforded colonial agriculture. In spite of this protection to agriculture, neither Cape Colony nor Natal raises sufficient produce to supply its own needs. In the cities of the older colonies there is a strong feeling that duties on foodstuffs should be reduced, and that any deficit due to these reductions should be made good by excise taxes, of which there are none at present. The Transvaal representatives will go into the conference to obtain lower duties on all foodstuffs, but they will meet with much opposition from the Dutch element in Cape Colony, which has always stood out for protection for home-grown produce. For a generation past the Dutch have dictated the tariff policy of Cape Colony, and, owing to the weight of Dutch influence, Cape Colony is likely to be the most difficult colony to deal with in the Customs Union Conference.

❀

Religious Conditions in the Sudan

For some years the statement has been repeatedly made and as often denied that Lord Kitchener, after destroying the power of the Mahdi and assuming the administration of the Sudan, issued a decree prohibiting Christian missionary work among the Mohammedans in the dependencies confided to his charge; and that this action was later confirmed by Lord Cromer, British Plenipotentiary in Egypt, who, on his first visit to Khartûm, took occasion to assure the Sudanese Sheiks that there would be no interference with their Muslim faith and religious customs. It has been questioned whether this pledge, if given at all by these proconsuls, has been maintained during the four years which have since elapsed, and whether, as regards a Christian propaganda among the Moham-

medans in the Sudan, the country still remains completely barred to the agents of the various missionary societies of Europe and America. The societies which had long since established stations in that part of Africa were forced to abandon them twenty years ago by the Dervish insurrection; it has been understood that since then none of them have been allowed to resume operations, a rule operating with equal impartiality against Protestant and Roman Catholic missions. Rumor has it, however, that an exception to this rule has been made in favor of the Copts, and that the latter are now endeavoring to Christianize the Sudanese; but that the Copts receive no direct encouragement from the British Government, which simply tolerates their presence. In view of the lack of exact information on the subject, The Outlook takes great satisfaction in printing the following official statement from the British Government, which it has just received in answer to a request for information. In a letter to The Outlook Sir Reginald Wingate, Governor-General of the Sudan, says: "There was no decree issued by Lord Kitchener prohibiting Christian missionary enterprise in the Sudan, but he made it a rule not to allow Christian missionaries to work among the Mohammedan population, though he offered no objection to their working among the pagan population. This rule is still observed, and there are Christian missionaries now at work *south of Fashoda*. No distinctive treatment is made between Catholics and Protestants. The Copts exist in considerable numbers in the Sudan, especially in Khartûm; they have their own clergy, but do not proselytize. In this respect they do not receive treatment different to that accorded to members of any other religion." It should be added that this letter is received through the Marquis of Lansdowne, British Foreign Secretary, and thus receives additional official sanction.

The American School at Athens

As the twentieth report of the American School of Classical Studies at Athens has just been published, the present seems a fitting time for a survey of the history of the School. It certainly is a fitting time to call attention to its opportunities not only for those who desire to become specialists in archæology, but also for those who wish to become better students and teachers of classical philology. When the School was founded, says Professor Seymour, of Yale (Chairman of the Managing Committee of the School, 1887–1901), the linguistic study of Greek was more fashionable than it is at present, and no one doubted that some of the students would be interested in the study of modern Greek in its relation to the ancient language. Strange to say, however, none of the 127 American students has as yet chosen this field of research, although the characteristics of the popular language are gradually fading before the efforts of the public schools to further the use of the literary language. In archæology the School has proved its usefulness: last year, for instance, more American scholars were in Greece for archæological study and research in connection with the School than visited Greece for a stay of more than two months during all the years of the nineteenth century before the School was established. It should be reaffirmed, says Professor Seymour, that the School does not aim solely, nor perhaps mainly, at training specialists in archæology; it desires also, and perhaps chiefly, to encourage on the part of classical scholars archæological study which will throw light upon their classical studies and give life to their teaching and interpretation of literature. A review of the two decades of work recalls many distinguished names in scholarship, among others, of Professors Baird, Goodwin, Allen, Packard, White (the present President of the Archæological Institute which founded the School), Merriam, Waldstein, J. R. Wheeler (Chairman of the Managing Committee), B. I. Wheeler, Tarbell, and Richardson, the present Director of the School. The Outlook has already called attention to the valuable excavations conducted by our School. These have not only added to the world's sum of archæological knowledge, but have given to the School a prestige not otherwise obtained. The expenditures for these excavations have been about $16,000. For the new home of the School the Greek Government gave the building site; it immediately adjoins the ground of the British school. The American School needs a

larger income than it has at present; it should have a permanent endowment of at least $150,000, with an additional income of $100 per year from each of thirty American colleges and universities.

●

A Council of Jewish Women

The organization known as the Council of Jewish Women originated in Chicago in 1893. The Congress of Jewish Women held as a part of the Parliament of Religions at the World's Columbian Exposition proved such an inspiration to the Mothers in Israel, who never in all the centuries of Judaism had been as a distinctly religious body "in congress assembled," that it was determined at the final session to organize permanently as a national body. But, two sections having since been organized in Canada, the term national was necessarily dropped from the title. The chief objects of the association are the bringing about of closer relations among Jewish women, with a view to the united study of Hebrew history, literature, affairs, and conditions, and for the work of social reform and philanthropy. Two triennial meetings have been held since 1893—one in New York, in November, 1896; the other in Cleveland, in March, 1900; the third, which took place in Baltimore early in December, was no less important and interesting than the others. The sessions were very largely attended; those in the morning and afternoon being chiefly restricted to delegates and reserved for the transaction of business and reports of the actual work of the Council, while the evening sessions held in the large auditorium were open to the public, and were addressed by prominent men and women, specialists in those matters in which the organization is interested, but not all of Hebrew birth. Among the speakers was Miss Jane Addams, of Hull House, Chicago, on "The New Social Spirit," which is, she says, preventive rather than curative. Social hygiene rather than social medicine is needed by the body politic; we reform by eliminating causes. A particularly interesting discussion followed the presentation of the report of the Committee on Religion. The works of Heine and Disraeli had been studied by some sections, while a certain rabbi had lectured to his people on the life of Jesus of Nazareth, with the view that they should be "informed, and not misinformed," regarding it. The query whether these were properly the subjects of investigation by the organization as such was freely argued, and the opinion of the Rev. Dr. Rosenau and other rabbis who chanced to be present was asked. One of these was of the mind that what was most needed was the strengthening of the emotional side of feminine religion. No positive conclusion was reached on this important subject; but the balance of opinion seems to have been against the study of the life and work of "apostates" from Judaism. This, however, is a considerable advance from former standpoints of Hebrew orthodoxy.

●

Trained Nurses at Public Schools

Thanks to the vigilant public spirit of the Nurses' Settlement, an unusually promising innovation has just been made in New York City's system of caring for the health of public-school children. For some time past the schools have been visited periodically by physicians, who examine the children and send home those not well enough to be in school or who show signs of disorders likely to be epidemic. Under the present efficient head of the Board of Health, Dr. Lederle, this system has been enforced so scrupulously that, while the health of the schools has been materially improved, the attendance in many of the poorer districts has been materially diminished. Children, for example, who had sore eyes have been sent away and told to return when their eyes were well, but have had such inefficient treatment at home that when they returned their eyes were still affected, and they had to be sent away again. In this way many fell behind their classes and dropped out altogether. Thus a serious condition confronted the Board of Education, and it almost seemed as if the interests of education were in conflict with the interests of health. At this juncture Miss Lillian D. Wald, the head of the Nurses' Settlement, suggested to President Burlingham, of the Board of Education, and Dr. Lederle, of the Health Board, that two trained nurses should be assigned to school buildings in the neglected districts, and should treat in-

the schools all minor disorders, and visit the homes of children requiring more serious attention to instruct their mothers as to what should be done for them—how, for instance, boracic acid should be put on sore eyes, and simple remedies administered for colds and other troubles. The plan was warmly welcomed, and Miss Wald's associates who volunteered for the work took hold of it with enthusiasm. The results even exceeded the high expectations at once aroused, and in a few weeks nearly all the children who were out of school on account of various disorders were back again in their places. Furthermore, it was shown that one nurse who took hold of this work sympathetically and not perfunctorily could, under normal conditions, look after the children in three or four great buildings, teaching the foreign-born mothers to do most of the work without the expense of calling in physicians. The plan has worked so well that the educational authorities have decided to engage nearly a dozen trained nurses to look after some forty buildings, and the innovation promises soon to become an institution.

❀

The Triumph of Wireless Telegraphy

December 21, 1902, will be a memorable date in the history of trans-oceanic telegraphy. On that day formal inauguratory and congratulatory messages were exchanged through the Marconi wireless telegraphy system between Cape Breton, Nova Scotia, and the Poldhu station at Cornwall, Great Britain. The Governor-General of Canada sent a message to King Edward; a similar message was transmitted to the King of Italy; and one or more press despatches were also successfully passed over the ocean without the intervention of cable or wire. It is stated that in a very short time the line will be in operation for commercial purposes, and a low rate is thought to be possible because of the comparative cheapness of the actual operating expenses after a wireless system has been installed. It need not, however, be supposed that the day of the cable is over; as a rule, great inventions have found for themselves new uses and have supplemented rather than supplanted former inventions. It remains to be seen, also, exactly how far the new system may be depended upon for continuous and unbroken working, and for freedom from possible interruption. The Outlook has already described Mr. Marconi's inventions, which, in the main, are of skillfully devised practical adaptations of principles already recognized. These adaptations and his immensely ingenious apparatus for making the wireless system effective will deservedly place Marconi's name among those of the greatest inventors of our century.

❀

The Mask of the Years

The sunlight has marked the hours for centuries on old dials in English gardens, but there remains no record of their number or their beginning. In the heart of the earth there are ancient memories which have been deciphered; and men have kept, for a part of their life in the world, a register of their thoughts and deeds. But no one knows when time began, nor does any one foresee its ending. So accustomed are we to its divisions and subdivisions that we forget that it has no real existence outside our own minds. It is a universal convention, but it is only a convention; something agreed upon and accepted for convenience; an accommodation to our limited vision and knowledge. So long has this convention been established and so universal is its acceptance that we have fallen into the habit of setting it in antithesis with eternity; forgetting that it is only a very imperfect attempt to bring eternity within the range of our experience and to make it, if not comprehensible, at least usable. Time is one way of reckoning the bit of eternity which our earth or our race remembers. There is nothing outside ourselves which corresponds to it; it is a convenient and necessary fiction; eternity is the only reality.

The time-sense is of importance because it helps us to give our lives order and to keep us in working relations with our fellows; but it is the sense of eternity which makes deep thinking and noble living possible. Time is a little section of the great whole which is eternity; it is a detail in a great plan; to live as if it were all of life, to see things as if their

time-relations expressed their real significance, to value our opportunities and tasks and burdens as if they were related to the years which we number, is to put a part in place of the whole and to miss the meaning and glory of living. It has been said of Dante that he saw life under the aspect of eternity. When he looked at the seed, the tree stood before him; when he saw the sowing, he saw in the same vision the harvesting; in every act he discerned a cause whose effect was present, in every deed he foresaw the fruitage in power or in misery. He did not look ahead; he simply looked into the heart of things; he saw things through the sense of eternity. The greatness and the terror of "The Divine Comedy" lies in the fact that it destroys the fiction of time and makes us suddenly aware that on this very to-day, the hours of which are registered on dials in sunny gardens, we are in eternity.

In so far as art is noble and significant it annihilates the sense of time and brings us face to face with the beauty and the terror of eternity. The Sistine Madonna sets the mother in the light of eternity, and all heads are uncovered and all voices are hushed in the sudden discernment of the meaning of motherhood in that language of the spirit which is the speech of eternity, when all disguises are torn away and the divinity of true living is revealed. The "Last Judgment" fills us with awe, not because it is a picture of a great event to come in some distant age, but because it makes us aware that we are sifted, tried, and judged hour by hour, and that the great artist has dramatized in a moment of time the eternal process. There are portrait-painters who have such power of divination, of penetrating the mask of the countenance to the character, that their canvases are revelations of the eternal elements in the nature of the man or woman behind the touches and moldings of time. Whenever the soul comes into view, the man is seen under the aspect of eternity. It is one of the highest services of art that it shows life under the aspects of eternity; the fiction of time dissolves under the searching glance of the great artist or thinker. Shakespeare's genius lies in the unique power with which he gives us the feature of the time and the hidden soul which is eternal behind it; the graphic dramatic force with which he delineates the deed, the masterful insight with which he relates it to the man and his fortunes.

In this double power the Bible is unique among the books of the world. Concrete, pictorial, historic, it flashes light at every turn on the ultimate results and conditions; picturing with marvelous vividness the sowing of the seed, it instantly discloses the harvest. In this lies its pervading, prophetic quality; its steady discernment of the things that are to come because at every stage it lays bare the hidden process which, in the eye of the prophet, is accomplished as soon as it is set in motion. So the Christ moves to his martyrdom with such certainty that long before the star shines over Bethlehem the agony of the cross is announced.

The years come out of the great silence in unbroken succession because we need their divisions in our endeavor to realize, in daily experience, the continuity of eternity. They give us something to grasp and use; but they must not confuse or blind us to the truth that the life we now live is eternal, and that while we number our years and distinguish them one from another, we are already in eternity. To-morrow is already in to-day; the distant future is part of this swiftly departing present. What we think and do in this brief instant we are and shall be in the far-off cycles to which we move. Our deeds are not of the day; they are of eternity. Below all the shiftings and changes, the moods and emotions, the depressions and exaltations, something indestructible is shaping itself as surely as below the bareness and icy bondage of winter a vast life is organizing itself.

Our sorrows are registered by the days, but if the root of submission and faith is in them they are as certainly overpast as if already the shadows were gone and the heavens were soft and gracious over our heads. So far as the righteous are able to look through the mask of the years, light is not only sown for them; it already floods the skies. So far as the high purpose is deep-rooted and loyally held, nobility and strength and freedom are already achieved. So far as love is pure, unselfish, and sacrificial, it is already safe against the ravages of death. Life is not yet at the flood, but it is ours as

if we were in full possession of its unbounded resources; the perfect stature is yet afar off, but if the law of growth is working in us, it is already ours as surely as if we had completely attained. The sorrows which the years bring the years take away; they are of the time and the place, and we are not the slaves of time and place; but our joys, having their source in the soul, are indestructible. In the darkest night we know that the day is below the horizon; the shadow on the dial does not confuse us; we know that the sun is on the way. In our deepest griefs, if we look into our souls, the joy of eternal possession already stirs; it needs but the ripening of our faith and patience to bear its perfect flower. The life of love is not counted by the years; once born in the heart, it abides forever. Sown in the furrows of time, it blooms in those immortal fields where no shadows wait to hide the sun and no chill of death checks the eternal growth.

❀

Beauty for Working People

It has taken a good while to make men understand that, as the artist is conditioned on the strength, character, and quality of the man, so the workingman as a factor in the industrial world is conditioned on the force, energy, and character of the man. In other words, working men and women are not simply hands, they are complex human beings, whose work is not a matter of routine, but is diversified by numberless differences of temperament, strength, intelligence, and character. The best investment that the country can make economically is to build up a high grade of working people—men and women, in other words, who are not machines, but who have individuality, health, vitality, conscience. Such working people are not produced under bad sanitary, physical, and moral conditions. They are not bred under the system which regards them as so many hands to be paid so much money at the end of the week. If the best is to be gotten out of them, the best must be given to them. If they are to be intelligent, they must have opportunities which will enable them to gain the intelligence. If they are to have taste, individuality, originality, they mus have a chance to become skillful. I they are to have conscience and joy i their work, they must be put in the way o having joy and conscience in their live Society must deal, in other words, wit the workingman as a man; must buil up his character, his intelligence, his skil as a man before it can get the best out o him as a worker.

It is not many decades since this truth which has been slowly evolved out of th economic experience of the last three hun dred years, began to be practically applie in the endeavor not only to make th homes of workingmen wholesome, but t make their surroundings beautiful; no only to give the factories solidity of struc ture and proper light and air, but also t make them attractive. When the sugges tion was first made that working peopl needed the beauty of the world as othe people need it, and that business me would do well to meet that need, the sug gestion was scouted as sentimental, un businesslike, doctrinaire. As a matter o fact, everything that makes men mor efficient is in the last degree businesslike and the agitation for making workin people's homes and factories attractiv instead of ugly has steadily made progres until the time has come when many o the foremost manufacturers in the countr not only cordially recognize the principl but are doing their best to apply it. Th magazine which has the attractive title o "Home and Flowers" and is devote "to a more beautiful American life," ha been securing the opinions of a numbe of leading manufacturers touching th matter of making business plants attrac ive. More than five hundred busines men in all parts of the country wer addressed, and of those replying th editor of "Home and Flowers" report that ninety-five per cent. agreed that th product of a factory or of a business o any kind is much more valuable when th factory or office is clean, attractive, an beautiful, and when the employees d their work amid surroundings which ar orderly and artistic.

The President of a large cutlery manu factory, for instance, puts the whole mat ter in a paragraph when he says: "Th more a man a man is, the more valuabl he will be to any concern and the mor

he can do and will do to aid in its success. Since æsthetic surroundings are the constant, silent appeal to the better nature of man, that man will do better work and do it more quietly, quickly, and pleasantly in congenial surroundings than otherwise. . . . Work is many times wearisome and monotonous, and the more brightness and beauty that is thrown around the worker the better spirit he can put into his work." The President of a large manufacturing concern in Ohio writes that tasteful surroundings have made it possible for the factory which he manages to get the best men as workers; that their employees appreciate what they are trying to do in making the shops attractive, and that these employees join in any effort to take care of the place and prevent abuse of its privileges. A large manufacturer in Pennsylvania writes: "If you could induce new factories to provide for a garden or small park in connection with their plant, with a summer pavilion where workmen could eat their noon lunch and rest, it would be a fine thing for humanity." From a well-known printer in the same State comes this business creed: "I believe there is a very great business value in having æsthetic surroundings to a business plant. This value is inward and outward both, and, if properly backed up, means better and more business." A prominent manufacturer in Illinois is sure that "there is always more gain in having attractive surroundings than would be lost by the cost of repairing and maintaining proper conditions." A firm of representative manufacturers in Connecticut, who have long been notable for their care for their operatives, declare that they make their mills as clean and attractive as possible, but have very little faith in supplying decorative art to workshops. An Ohio manufacturer does "not believe in spending much time on flower gardens or surroundings," but freely recognizes the good result of "feeding and broadening the intellect, which will mold the surroundings of the workmen"—which is precisely the service that gardens and proper surroundings render.

A very pleasant picture is suggested by a Tennessee manufacturer, who writes:

Our mills are covered with ampelopsis and a courtyard walls with the same vines, in the center of which is a fountain surrounded with a twenty-foot bed of caladiums. These, together with several beds of cannas planked about the yards, make our surroundings attractive in the summer-time. It proves a pleasure to our workpeople and to ourselves.

It has taken a long time to convince some business men that there is any profit to be gotten out of beauty; but, on the other hand, there are a great many business men who take a broad enough view of their interests and who have a sufficient knowledge of conditions elsewhere to know that beauty, to put it on the lowest possible basis, is an extremely marketable quality, and that as an investment it often pays a very high per cent. of profit. The consensus of opinion secured by the editor of "Home and Flowers" is encouraging as showing the broadening view of business by able men of affairs, the clearer discernment of the great truth that in order to get the best work out of a man you must first develop the best possible man.

●

Why Not?

If any reader of this paragraph failed to read Miss Miner's article on "American Barbarism and Chinese Hospitality" in last week's issue, we hope he will turn back to it and read it now. Whoever is responsible for such an injustice as she describes, the American people will be responsible if they allow it to be repeated in the future. The Outlook believes in a Chinese exclusion law. It believes that we have a right to put such limitations upon immigration as may be required by a due consideration for our own National welfare. But these considerations do not require a law which excludes Chinese students from coming to America to acquire an education to fit them to return and work to promote a higher civilization in China and so secure more cordial relations between China and the United States. It would be a perfectly simple thing to prevent the law from operating to bring about such an exclusion, which it is not the intent of the law to bring about. It would only be necessary to add to the law a clause something like the following:

But the Collector of the Port (or the Secretary of the Treasury) may in his discretion, on

application indorsed by two or more American citizens, admit a Chinese immigrant, on satisfactory evidence that he is not a laborer and that the irregularity or imperfection of his certificate is due to no fault of his.

An inflexible law, allowing no discretion in the administration, is not workable. Some discretion in its application should be lodged somewhere in a Federal official. The evils of allowing such discretion would be inconsiderable. The evils of not allowing it are very serious. It is quite plain to all observers that the future commercial prosperity of this country is very closely bound up with the development of American trade with China; and if we are to increase our trade with her, it must be by cultivating the good will of her leading citizens. To treat representatives of her cultured class as the two young men were treated whose story Miss Miner told last week is to undo the work done by Secretary Hay's splendid diplomacy. The inhabitants on the Pacific coast are interested in developing commercial relations between the United States and China; the commercial future of that coast depends upon their success in establishing such relations. They ought to take this matter up, and not rest until such a change is made in the exclusion law as will render impossible insult and injury to representative friends of America among Chinese leaders of public opinion.

❀

The Archbishop of Canterbury

It is a good many decades since the dingy palace which Wolsey built across the Thames has housed a man of more typical English temper, of greater courage, and of more force than Dr. Temple, Archbishop of Canterbury, who died at Lambeth Palace last week. Among the many forceful and interesting personalities who have crowded English public life during the last half of the last century, Dr. Temple held a foremost position. He was not a great scholar in the sense in which Dr. Creighton, late Bishop of London, was a scholar; he was not a great theological writer; he was not a great preacher, either of the popular type like Canon Gore, or of what has been called the Cathedral type, like Canon Liddon; he had not the winning personal qualities of his predecessor, Dr. Benson; but in force of character, energy of mind, and the courage of opinion, Dr. Temple rose, if not into the ranks of great men, certainly into the ranks of those Archbishops who have enriched the tradition of intellectual leadership in Lambeth Palace.

Born on one of the Ionian Islands in 1821, the son of a Governor of Sierra Leone, Dr. Temple, unlike most Englishmen of his position, was compelled to make his own way in the world. At seventeen he was thrown upon his own resources. "I have known," he said, "what it was to go without a fire because I could not afford one; and I have worn patched clothes and boots." As a boy and youth he knew at first hand the hard work of the farm; but he was fortunate in securing what was absolutely essential for his later career, a thorough education. He went to the Grammar School at Tiverton, and subsequently to Oxford, where he made his mark and became scholar of Balliol, the Oxford college which in recent times has been notably associated with scholarship. His election as Fellow and Mathematical Tutor of Balliol gave him six additional years of study in the seclusion and the stimulating atmosphere of Oxford. He was ordained to the ministry in 1846; two years later he became Principal of the training college for teachers at Kneller Hall. In 1855 he became Instructor of Schools, and three years later was chosen the Head Master of the Rugby School, a position which he held for eleven years. His masterful hand was felt in every department of the school; and the two sides of his nature—his keen sense of justice and his bluntness of manner—were both expressed in the well-known phrase of the Rugby boy who wrote to his father: "Temple is a beast, but he is a just beast."

When the famous volume of "Essays and Reviews" appeared in 1860, Dr. Temple's initial essay on "The Education of the World" drew a fire of criticism; and the book was the center of a hotly contested battle of opinions. Two of the essayists were tried and finally acquitted. Dr. Temple's essay, which was regarded as extraordinarily radical at the time of its publication, was a very

THE ARCHBISHOP OF CANTERBURY: THE MOST REV. FREDERICK TEMPLE, D.D., LL.
Died December 23, 1902.
From the portrait by Hubert von Herkomer.

cautious acceptance of the general idea of progression in the revelation of truth, and its positions are to-day almost universally accepted.

The opposition aroused by the publication of "Essays and Reviews" came to a focus when Mr. Gladstone in 1868 nominated Dr. Temple as Bishop of Exeter. Dr. Pusey, who was a saint, but a very partisan saint, declared that the selection of Dr. Temple was "the most frightful enormity that had ever been perpetrated by a Prime Minister." Dr. Pusey did not understand that such extreme movements as that in which he himself was a leader always produce extreme reactions. The excesses of the Tractarians gave occasion for the broad theology of "Essays and Reviews." After a hot and prolonged discussion, Dr. Temple's election was confirmed, and for seventeen years he put his whole strength into the many-sided work of an English Bishop, doing everything with energy and decision. In 1885 he became Bishop of London; and, in spite of failing eyesight, he immediately made his mark on that vast diocese by the vigor and directness of his administration. Many stories were told of his bluntness. It used to be said that an interview with the Bishop of London consisted of three sentences on his part—"Who are you? What do you want? No."

On the death of Archbishop Benson, six years ago, Dr. Temple was appointed Archbishop of Canterbury, being the twenty-seventh who has held a position second in dignity in the English order only to that of the sovereign. Time had ripened without weakening the independence and vigor of Dr. Temple's mind. He had ceased to be a radical in the partisan sense, but he had not parted with his breadth of view or his independence of action. In an address delivered in 1898 he struck the keynote of his administration when he said: "The ceremonial is the order of the Church; the teaching must be to a large extent the voice of the individual." No Bishop in recent years had more perplexing and difficult questions to deal with. The Church has been shaken almost to its foundations during the last three years by the practices of the extreme ritualistic party, the claims of the pronounced Anglo-Catholics, and the vigorous opposition of the Protestant party in the Church; the disposition of great ecclesiastics to seek the safe rather than the bold course, to speak smooth rather than true things, which has so often brought reproach upon the Church, cannot be charged to Dr. Temple. In a series of addresses on various ecclesiastical occasions he stated the position of the Church on all the points at issue with absolute candor and clearness. His general policy was to permit such a latitude of opinion as the discipline of the Church and the authority of the Bible, as he understood them, permitted. He regarded himself as at the head of a national Church, not the Archbishop of a party; and he stood for tolerance within what he regarded as the legitimate limits of freedom under the Church order and teaching.

Although an old man when he became Archbishop, Dr. Temple has left the mark of his energy and independence on the English Church. Up to the very end, in spite of increasing evidence of failing strength, he performed his duties with extraordinary vitality. The faintness which nearly overcame him during the long and complicated ceremonial of the coronation first directed public attention to his condition, and was the occasion of one of those acts of quick-witted courtesy which are so characteristic of the King. A second similar attack, to which Dr. Temple almost succumbed in a recent speech on the Education Bill in the House of Lords, made it evident that the end was not far off. To the last of his life he lived up to the popular characterization as "The Grand Old Man of the English Church." With a strong and rugged face, large of stature, a brisk manner, speaking with great energy without notes in the most straightforward English, Dr. Temple was a debater of great skill. Indifferent to the applause of friends or the condemnation of opponents, more anxious to speak what he felt to be the truth than to please or placate, a man of force rather than of charm, of mental vigor rather than of intellectual greatness, but one whose very limitations had a certain tonic influence in a position the traditions of which all lead towards complaisant conservatism, Dr. Temple was a leader of the English Church in a great crisis in its history.

IN DELHI

BY WILLIAM FREDERICK DIX

DELHI, the chief city in the Punjab, in India, flashes prominently into the public eye this January on account of the great Durbar—the proclamation of King Edward as Emperor of India. Many English and Americans are already starting to see this pageant, which will be the most picturesque and magnificent since the days of native rulers.

The four most impressive drives in the world are, to my mind, the one from Rome out into the Campagna on the Via Appia, the one under the acacia-trees from Cairo to the Pyramids, the one from the Damascus Gate, Jerusalem, to the Mount of Olives, and the eleven miles between the ruined and desolate tombs stretching from New to Old Delhi. And this history-laden road, the main artery of "all the Delhis," is singularly like the Roman Via Appia. Desolate and mourning over past glories, unmindful of the present, with moss and weeds clinging to its dismantled monuments, it passes between tree-dotted plains, mysterious with untold stories, and oppressively silent. Only an occasional wheel creaks along its ruts, and the modern world seems far away. Here and there, as the morning sun rises, the shadows from the tombs of long-dead heroes shrink away from it and nestle close to the ruins.

And Delhi, the capital of the great Mogul emperors, whose splendors lasted through five reigns, Delhi, the ancient city, the largest and commercially the most important in the country, filled with the richest historical and legendary associations, is the Rome of India. The old and the new cities that bear the name covered an area of forty-five square miles, and the ancient palaces of marble and sculptured stone occupied parallelograms measuring sometimes fifteen hundred by three thousand feet. Delhi's origin is lost in obscurity; in the tenth century its fame had spread far and wide, and during the great Mutiny it was the chief strategic point of all India. Unless it could be taken, the empire never again would be held by the English; and when, after the desperate attack that demolished the Kashmir Gate, it at last fell, the moral effect brought about the end of the rebellion.

And this winter, in January, when Edward VII. of the United Kingdom of Great Britain will be proclaimed Emperor of India—of that vast continent comprising the realms of Madras and Bengal, of Hyderabad and Rajputana and the Punjab, of Mysore and Bombay—Delhi is the spot chosen for the ceremony. Emperor of India! Think what it means! Lord of a continent stretching from tropical Ceylon to the untrodden and icy peaks of the Kinchinjunga range of the Himalayas rising twice as high as the highest

suzerain of the proudest princes in the world, the Rajahs and Maharajahs of India; and titular master of glittering armies, of jungles and deserts, villages and teeming cities, of a land over which seven great religions hold sway—Brahmin, Hindu, Jain, Buddhist, Zoroastrian, Mohammedan, and Christian! India is not one country; it cannot be described as a unit; it holds many peoples and many differing institutions; and throughout its length and breadth, through all its castes and climes, there exists a vast mystery never yet understood by Western minds. There are subtle undercurrents of thought and belief, elusive and mystic principles, which our science cannot explain. Western force can capture and Western law can control and govern, but Western philosophy is still baffled at Indian occultism. The English are the physical masters of the land, but spiritually the two races seem forever separated.

But the Durbar at Delhi is the proclamation of the controlling power of England as represented by her present King; and the Viceroy of India, Lord Curzon of Kedleston, is planning it to be the most brilliant ceremony ever held during the new régime. So there is not a vacant berth on any passenger ship leaving England for India, and Delhi will contain more Europeans during the first part of January than are to be found in most of the land at other times, the army excepted. Lady Curzon being an American, there will be a number of our country people there, as well as many French and Germans, and the hotels and lodging-houses are charging extortionate rates. The humblest houses and even forlorn and primitive huts will be used to shelter the visitors; and the native princes, who will assemble from the various principalities, are preparing to show the most lavish hospitality to their English guests, in return for courtesies extended to them in England at the time of the coronation.

So new life will come to the picturesque city; its streets will blossom with the flower of Indian chivalry; Nawabs, in brocade and cloth-of-gold, in garments of glittering kinkob, with plumed turbans and gem-studded arms, will throng the streets; chariots and elephants bravely caparisoned, richly harnessed white bullocks, and superb horses will make the scene mediæval in its picturesqueness, and merchants will display costly fabrics, jewels, and armor, and reap a golden harvest.

But Delhi in its usual life, and as I saw it, lies dreaming of days still more glorious. A profound peace has settled over it, and at night, when the hearth fires are lighted, the smoke settles down over the low dwellings in a blue-white haze, and the droning life of the day subsides and leaves the city wrapped in fatuous memories of the past.

As in Rome, there is the striking contrast of the old with the new, but in Delhi the two ages do not jostle each other so closely. In the modern town are the long, low hotels for travelers, the mosques, bazars, and dwellings of the natives. The streets are dusty, shadeless, and shabby, and swarming with people. The traveler is constantly beset by the merchants as he walks about; they thrust their wares and business cards under his nose and follow him even to his hotel. He cannot step from the door without stumbling over crouching figures who hastily spread out their embroideries and brocades before him. Jugglers crouch in the corners of the verandas ready to produce a little mango-tree from the seed "while you wait," or charm the snakes they uncoil from the basket, and beggars show their deformities and implore alms. The hotel is bare and chilly, and the traveler must, as always in India, bring his own servant, bedclothing, and napery with him. From my hotel, built on the city wall, I could look down on one side over a forest, and on another over the housetops. Here, so far north in the Punjab, chimneys are to be seen among the flat roofs and rounded domes. Fireplaces are in most of the houses, because the nights are very cold in winter, and all day there is a spice of coolness in the air. This naturally has its effect in the costumes of the people. In the south they wear scanty garments of thin white or dyed cotton; here one sees quilted coats and trousers on both men and women, heavy turbans, and, upon the richer class, Cashmere shawls of red, blue, green, and white, and embroidered cloaks.

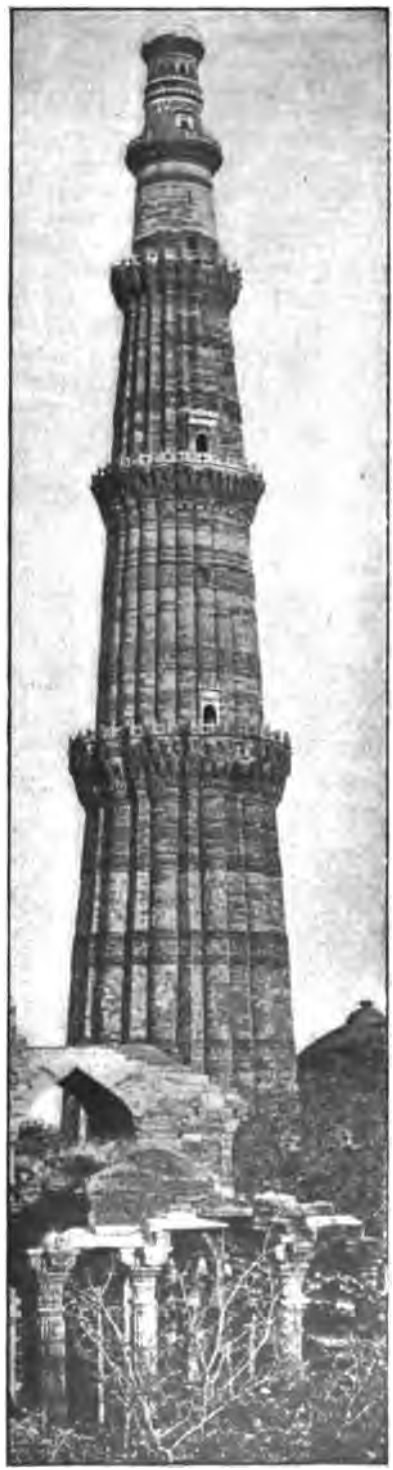
To explore the city in comfort it is better to ride, as the importunate peddlers and beggars are thus somewhat avoided, and if one wishes to buy of the native

OUR ELEPHANT IN THE PUNJAB, READY FOR A TRIP

A DELHI WATERING-CART

wares he should go to the shop of some reliable merchant. Here he is led up to the second story—all the houses are two stories high—given a chair and a cup of coffee, and then dazzling brocades and camel's-hairs from Kashmir, embroidered saris from China, Bokhara draperies, ivories, arms, jewels, rugs, and the treasures of many Eastern looms, are spread before him by subtly persuasive salesmen.

In spite of the shabby appearance of New Delhi, one notices many a beautiful façade, graceful alcove window, and carved marble arch, and a multitude of small pointed domes create Orientally picturesque sky-lines.

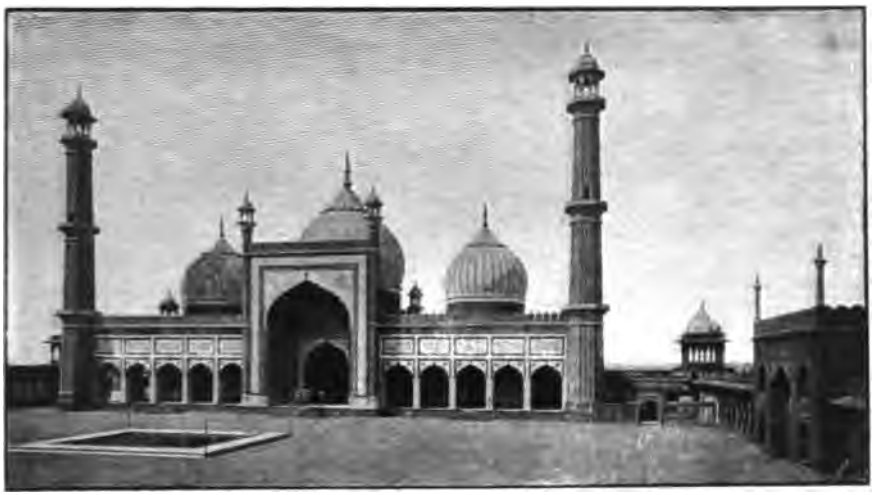


The two chief places of interest in New Delhi are the great parallelogram of marble palaces of the Moguls and the Jama Musjid, or Great Mosque. While wandering among these delicate marble palaces, one grows personally interested in such associations as those relating to Lalla Rookh, the wife of Shah Jahan, who now lies in the most beautiful sepulcher ever built for a woman (the peerless Taj Mahal at Agra), the Koh-i-nur, and the Peacock Throne. There is no European analogy to the Indian palace. It is not one great inclosed structure, for, with its arcades and open audience halls where the Moguls personally sat in judgment, accessible to the common people who presented their pleas without the intermediation of minister or secretary, it was a collection of scattered buildings. The Diwan-i-Amm, the Hall of Audience, is nearly two hundred feet long and is open, with arcades

THE PRIMITIVE METHOD OF GRINDING CORN IN DELHI

on three sides. Here was the throne of the Emperor, with its canopy and protecting rear wall all built of marble, and it is perhaps the most exquisite and delicately beautiful example of carved and inlaid marble in the world. Here, inlaid in semi-precious stones and studded with jewels, birds of brilliant plumage are pictured, some on the wing, others poised upon sprays of foliage. Every feathered creature of the land is faithfully reproduced in mosaic in unfading colors, and the graceful arches rise in perfect symmetry, forming the canopy protecting the throne. Near by is the Hall of Private Audience, where the ruler received his ministers, and this likewise is built of marble and inlaid with gold and precious stones. Here was the famous Peacock Throne, whence the laws of India went forth. Behind it were the two peacocks with spread tails so inlaid with diamonds, rubies, emeralds, and pearls that they gleamed with the colors of life. Between them was a parrot, life size, and carved out of a single emerald! The throne itself stood upon six pedestals of solid gold inlaid with gems, and beside it were two umbrellas—Oriental emblems of royalty—of embroidered crimson velvet fringed with pearls, and with handles eight feet high, of solid gold set with diamonds.

The eyes of one of the peacocks were made of the two enormous diamonds, the Koh-i-nur and the Koh-i-tur—the "Mountain of Light" and the "Mountain of Sinai." History tells us that when Nadir Shah sacked Delhi and destroyed the Peacock Throne, the Koh-i-nur was not to be found. But a woman revealed the fact that it was hidden in the turban of the Emperor. As a treaty had been made, further pillage by the conqueror would have violated



THE KUTUB MINAR

the proprieties, so the wily Nadir, at a banquet, suddenly proposed that he and the Emperor exchange their gemmed turbans in token of friendship. There was no way of refusing this offer, and the Emperor relinquished his headdress. Later, when the Nadir retired to his tent and eagerly explored the turban, behold, in its folds lay the "Mountain of Light," the Koh-i-nur! Thus this wonderful jewel was carried off to Lahore, and remained there till the advent of the East India Company, and later it was presented to Queen Victoria, and now, largely reduced in size by cutting, it is safely guarded among the treasures of the English crown.

But the glory of New Delhi is its great Mosque, and when one mounts the most majestic flight of steps in the world and enters the vast platform inclosed by its colonnades and gateways, and sees the fierce sun beating down upon its white pavement and the fountain pool in the center, and looks across to the two great minars and the white domes rising into the blue sky, a vision of past glories and lost power comes to him. Here once walked the rulers and nobles of Ind, and had the Mutiny succeeded, here once again the Emperors would have paced under the marble arcades and their princesses, like sweet Lalla Rookh, would have been given in marriage to Eastern kings. But to-day only a few impassive natives lie asleep in shady corners, a silent figure or two crosses the vast square, standing out brilliantly against the gleaming marble, and the dim interior of the mosque is empty and silent. "This mosque," writes Temple, "built by the Emperor Shah Jahan, is probably the most beautiful, on a large scale, that has ever been seen by the world. Its vast dimensions, swelling cupolas, and lofty arches; its spacious courtyard, arcades, gateways, cloisters, and flight of steps, produce an imposing effect." But its vast size is hardly realized because of the perfection of proportion and the harmony of its coloring. The brilliant red sandstone contrasts with the dazzling marble, and the entire effect of this platform, with its surrounding arcades, its mosque and minars on one side and its lofty gateways midway in each of the other three, is one which first astonishes and then grows extraordinarily impressive as the details are comprehended.

Early one morning, just as the sun was rising, and when the air was almost frosty and not yet hazy with the powdery red dust raised by innumerable feet of men and beasts of burden, when the walls of New Delhi shone rosy against an azure sky, I drove along the eleven miles of this Indian Via Appia, bordered with the ruins of seven cities which had successively risen and fallen with the change of the centuries. Leaving the city by the Ajmir Gate, we drove through fertile fields with here and there a glint of water, the ruined gardens of noblemen whose names were long ago forgotten, and broken ruins or mounds telling of vanished glories. Passing the deserted observatory of Jai Singh II., India's greatest astronomer, who in the eighteenth century prepared the table of the stars, we came presently to a large tomb whose rounded dome rose fifty feet into the air. Directly beneath it was the usual marble tank, perhaps fifty feet square, and filled with stagnant water. As we looked, suddenly the dark, slim figure of a man was seen poised upon the summit of the dome, distinct against the sky. He had divested himself of clothing and was signaling to us. Then he crouched for an instant and gave a terrific spring, tense and quick as a panther, and shot forward into the air. Straightening out, he shot downward, arms straight above his head, and, clearing safely the roof of the mosque, struck the water with a sharp "chunk!" Widening circles of green ripples swept away to the sides of the tank, and then his head reappeared. Vigorously he struck out for the marble coping, climbed out, shook himself, and then pattered, dripping and obsequious, up to the carriage and craved the boon of four annas—about eight cents—for the feat!

Near by was the tomb of Shah Jahan's daughter, exquisite with perforated marble screens and delicate tracery. A group of natives and a priest, crouching in the sun by its walls, recalled some of Verestchagin's paintings of Indian scenes. In two hours Old Delhi was reached, a wilderness of dismantled palaces and tombs stretching away on all sides. Far behind us rose the walls, spires, and domes of the new city, rising like bubbles, filmy and iridescent, above the green plain. The sacred river Jumna sweeps through the

THE JAMA MASJID—GREAT MOSQUE

THE HALL OF PRIVATE AUDIENCE

Which once sheltered the Koh-i-nur.

fields, eternally young and life-giving amid the rise and fall of civilizations. On every side are seen moss-grown tombs and monuments, overgrown gardens, and forsaken homes. Fields of grain rise where once was a populous city; and here, amid the tangle of verdure, springs that astonishing shaft, the Kutub Minar. Graceful and slender as a reed, mysterious as the Sphinx, it rises two hundred and forty feet high, banded with five balustraded balconies, and almost covered with intricate carved inscriptions and designs. To say that it is forty-seven feet in diameter at its fluted base and nine feet at its broken top, that it glows with the soft hues of red sandstone, can give no idea of its beauty. No one knows why it was built, no one knows for what it was used. Here it stands, a spire of surpassing grace, preserved to us from unknown times.

Near it is the Mosque of Kutub al Islam, within whose sacred and cloistered courtyard many of its twelve hundred pillars still stand, Hindu in architecture and of infinitely varied design. Upon them all the patterns known to the workers in silk and enamel were chiseled in marble, and they are relics of days when Delhi was only Hindu, and before the architecture and the scimitar of the Mohammedans had swept over the land and brought strange ideas, buildings, and religious rites into this peaceful plain of the Jumna. The Mohammedan Mogul wrought great havoc here among Hindu monuments. With sledge and ax he destroyed the wonderful designs of peacocks and birds and elephants, he disfigured the idols of native gods, and constructed his mosques with the débris and columns of demolished temples; and in this courtyard, it is said, he built his colonnades with the sculptured columns from nearly twenty Hindu sanctuaries!

In a court by itself, among the weeds, rises a single column fashioned out of solid wrought iron. It is forty feet high, and its diameter is sixteen inches. It is believed to belong to the third Christian century, and Hindu tradition ascribes to it the origin of Delhi. The tradition says that when one of the early princes ordered it to be removed, its base was found to be still wet with the blood of some former ruler who had been slain beside it. Aghast, he tried to replace it, but the iron pillar, once uprooted, remained forever loose—"*dhila.*" And so sprang the name *Delhi*, of the spot. To-day, when native women pray for a happy marriage, or for the blessing of offspring, they make pilgrimage to this Sanscrit-inscriptured iron pillar of prehistoric times, and press their lips against its cool sides. So tradition, history, and superstition are forever intertwined about the place, and the briers, blooming with fragrant blossoms, twine about and shield the crumbling ruins of the ancient city. Across the plain the river still gleams and murmurs, and the men and women to-day pass to and from their work among these mounds and monuments of old Delhi, and the past is only vaguely recalled amid the interests and occupations of to-day.

Circumstances

By Charles W. Stevenson

The endless road has many a sudden turn;
  Its landscape changes ever and is gone;
  Yet must the myriad thousands journey on;
And many haply meet there who would learn
The pitfalls waiting and the dangers stern.
  But while they palter, lo, the happy dawn
  Is noonday, and a hopeful life is pawn
Unto the voiceless mystery of an urn!
The men and things that round us congregate
Are sent there by the will and wish of fate.
  We cannot say them nay, nor from the deep
Of nothingness call them to good or ill—
  A preappointed way we take and keep,
O'er self alone maintain supreme a will.

COPYRIGHT BY ELLIOTT & FRY, LONDON

The Editor of "The Spectator"

Few English journals are more widely known and more thoughtfully read in this country than the London "Spectator;" and Mr. John St. Loe Strachey, the editor and proprietor, during his visit in this country has doubtless been made aware of the cordial feeling of a large body of the most intelligent Americans towards the journal with which Mr. R. H. Hutton was so long connected. Mr. Strachey, who is the second son of Sir Edward Strachey, was educated at Balliol College, Oxford, is a barrister by profession, and has been a journalist by occupation for nearly twenty years. He was for a time the editor of the "Cornhill Magazine," but of late years has given his time and thought to the "Spectator," which under his direction has greatly enlarged its constituency, and, without sacrificing its high intellectual and critical quality, has become much more widely influential. The "Spectator" has combined in rare degree some of the characteristics of the highest journalism; wide interest in all that relates to the higher life of society, broad intelligence, generous sympathies, special knowledge in many departments, and the habit of appealing to the intelligence of its readers by its reasonableness and by the interest of its style. There are a good many American readers who have come to regard it, not only as the best of the English journals, but as one of the foremost journals in the English-speaking world; its restraint, its candor, its admirable taste, its sense of form, and its interest in all departments of the intellectual life have appealed especially to men of academic training, and probably no journal of the day is more widely read in American colleges and universities; nor have Americans forgotten its friendship for this country in a time when influential friends in England were few.

A SICILIAN GIRL OF BROOKLYN

THE ITALIAN IMMIGRANT IN AMERICA

BY WILLIAM E. DAVENPORT

Of the Brooklyn Italian Settlement

ILLUSTRATED WITH PHOTOGRAPHS BY ARTHUR HEWITT

IN MULBERRY STREET

AMONG the great movements of population which mark our time there are two quite unrivaled in their present proportions and prospective results. Of these the first is the settlement of northern Asia by Russian emigrants at the rate of 200,000 a year, and the second is the expansion of Italy in our Western world by an annual exodus hither of a quarter of a million souls. Certainly the rapid growth of our Italian-speaking population through this ever-increasing emigration from southern Italy, amounting to 178,000 in the past year, has awakened wide discussion.

Some look with strong disfavor upon the whole movement, feeling that our country is bound to suffer in its moral and intellectual interests by so great an incursion of the illiterate and untrained peasantry of Sicily and the extreme south. A question is also raised as to the proportion of Italian immigrants remaining permanently within our country, and the wide dispersion of those not remaining. It is said, too, that the greater part of those who come here seek only to secure a greater or lesser sum for themselves, and then hastily return with their gains to spend their later years in idleness under the romantic skies of their native land. There is, at all events, occasion for more exact knowledge on these matters, the importance of which every one admits.

In respect to the causes for this immigration, three general reasons may be distinguished: first, the already crowded condition of the Italian peninsula, containing a population of 113 to the square mile, as against 73 to the same area in France—although vast tracts in Italy remain practically uninhabitable, consisting of inaccessible mountain ranges or pestiferous swamps; second, the extraordinary fecundity of the Italian race of recent years, so that in a single year the births outnumber the deaths by 400,000, the increase being nearly one-third larger in the already crowded sections than in the north; third, the excessive taxation, which, all agree, falls most heavily upon the agricultural classes, who are least able to sustain its weight, especially since the widespread destruction of groves and vineyards by insect pests has reduced unnumbered families to the last extremity.

A certain proportion of Italian emigration, more especially that from the north, is directed to Montevideo, Brazil, and the Argentine Republic, the latter country especially proving most attractive to the agriculturists of Lombardy, Piedmont, and Liguria. Everywhere they have proved themselves thrifty and enterprising, leaving the Spaniards, after sharp competition, quite in the rear. Almost a million of them have come to Buenos Ayres since 1876—an annual average of three times the immigration from Spain. In Santa Fé

ITALIAN WOMAN BUYING FISH AT THE CORNER OF MULBERRY AND HESTER STREETS, NEW YORK

and Cordova they possess vast estates, from which they export great quantities of grain and over 30,000,000 gallons of wine annually.

Extensive immigration to the United States from Italy is a recent phenomenon. Thus, from 1860 to 1870 but 12,000 of these people arrived here, while the total of those coming since 1890 amounts to over 1,000,000. As this includes those who have returned from the United States to Italy and are now coming hither for a second or third time, it would be more correct to place the number of new arrivals from Italian ports at 750,000, while the total Italian-speaking population of our country, including children born here, cannot be less than 1,200,000.

It is demonstrable, however, that not more than twelve per cent. of this number now reside within the limits of the Greater New York. Even this, however, gives our city an Italian-speaking population of 160,000—about that of Venice, and more than one-third that of Rome itself.

The story of New York Italian life asks a chapter by itself. The two great sections of Manhattan practically surrendered to these people include some thirty blocks lying between One Hundredth and One Hundred and Fifteenth Streets, and extending from Second Avenue to the river. Downtown they occupy all the district lying between Centre Street and the Bowery, from Pearl to Bleecker, and to the west the whole length of Thompson, McDougall, and Sullivan Streets. The Bleecker and Spring Street Italians are mainly from northern Italy, while the uptown colony is chiefly from Calabria.

Then Brooklyn has no less than nine districts of Italian population, the two largest of which lie at opposite extremes of the borough. One of these, in South Brooklyn, includes Van Brunt and Columbia Streets, with portions of Hicks, Carroll, President, Union, Sackett, and Degraw Streets, while the Williamsburg group embraces nearly half of the Seventeenth Ward. How many Brooklynites realize that their borough has a larger Italian population than Lucca or Pisa, famous for a thousand years in the history of art?

Why do these people group themselves so closely together? One cause of this is the dependent condition of those arriving here with no knowledge of our language. If they are to obtain work, they must be with friends and relatives who have already acquired a foothold. But perhaps a deeper reason is the strong attachment which most of them possess for the ways and customs of their own land. Whatever the reason, one often finds several adjoining houses occupied exclusively by people from the same district. Thus, in Elizabeth Street, Manhattan, once a fashionable section of the city, there is to-day a group of several hundred families from Sciacca, a Sicilian fishing town forty miles east of Girgenti, the famous Acragas of Empedocles, where still stand the ruins of several of the most perfect Greek temples in the world. These people, living closely together, employ the Sciaccan dialect, possess Sciaccan doctors

TYPES OF ITALIAN LABORERS IN AMERICA
Workers in a Brooklyn macaroni factory.

and a Sciaccan pharmacy, and prepare resplendent festas in honor of "Maria S. S. del Soccorso Protettrice della Citta de Sciacca." Then there are over 130 Italian mutual aid societies in New York City, most of them composed mainly of natives of a single Italian province, the name of which they bear. Thus the Calabrians sustain the "Society of the Tre Calabrie;" and the membership of other bodies is constituted respectively by the "Cittadini Napoletani," "Cittadini Padulesi," "Cittadini Avellinese," etc. However, there are organizations more distinctively American, as the "Columbia Democratic Union," the "Italian Republican Club," or, best of all, the "Society of the Cittadini Americani." As a rule, the Italians of New York value their citizenship and vote on election day.

The sons of Italy, wherever found, are fond of music and outdoor life; and in New York they enjoy both of these luxuries when the band plays in Mulberry Bend Park. Then they pour forth from a hundred tenements (owned mainly by Italian landlords), and stand listening in rapt delight by the hour to the strains of "Il Trovatore," etc. At least one member of each family has some musical gift; and a violin hung on the kitchen wall may prove the love of melody no less than the grand square in a West Side drawing-room. Italians possess, too, an inherited passion for literature, so that it is not strange, even while we have a large illiterate Italian immigration, to find book-stalls and small libraries on almost every block about the Bend. Of course a good deal of trash is sold. There are comic sheets and Neapolitan dialect love songs by the score, and innumerable tragic or amorous novelettes by Carolina Invernizio and other popular writers. But with these is a solid body of the noblest literature in the world. Alfieri, Manzoni, Giusti, Tasso, Ariosto, Petrarch, and Dante are read by every one who can read at all. As popular as these are Silvia Pellico's "Mie Prigioni," and "Cuore" by De Amicis. Nothing, indeed, is more notable than the fervent interest of young Italians in their great history and the fame and works of their writers. There is a force of enthusiasm, a power of imagination and sentiment, latent in these people that must again in a free land be fruitful of splendid works. Already ten daily or weekly Italian sheets are published in New York City. The most important of these are the "Il Progresso," "Il Bollettina della Sera," and "L'Avaldo." The "Rassegna" is a high-class literary review, and the character of the "Revista Commerciale" is indicated by its name.

While the Italian peasants are great workers, those who come to us from Naples seem peculiarly fond of noisy diversions. Certainly they exercise their gifts in this direction extensively. Nearly all the Italian societies give festivals annually, generally during the summer, and these have been accompanied of late by such a racket of fireworks and bursting petards as to render them a public nuisance. Frequently great wooden and pasteboard shrines are erected on the sidewalk and the streets are arched with lines of Chinese lanterns. In a recent Elizabeth Street festa great wire brackets arched the street at intervals of one hundred feet for a quarter of a mile, and huge painted candles, eight to ten feet in height, and costing from five to ten dollars apiece, were presented by the wealthier families to the Madonna. Boys dressed in gauze and gilt, and arranged with wings attached to their shoulders to represent angels, were suspended in mid-air over the heads of admiring crowds. An interesting feature of these occasions, especially when held in the parks, is the baptism of the society banner, usually a handsome and costly piece of embroidered silk fringed with gold and richly ornamented.

There are several Italian theaters in Manhattan, where light comedies, heroic tragedies, and dialect plays are presented. Some of these theaters are maintained in the rear of saloons, and in the cheaper ones marionettes take the place of paid actors. In a Broome Street theater fairly good plays are presented, and occasionally the People's Bowery Theater is hired by the week by a first-class troupe.

Apart from their festas, New York Italians seem to take little outdoor diversion. One of their games, "Pallone," is played with a large inflated leather ball beaten about very much as in our football games. Boccia is also played in scores of back yards. In this game heavy wooden balls are thrown or rolled on the ground to a given point; a number of men play, taking

ITALIAN ORGAN-GRINDERS

sides, and the object is to knock out as many times as possible the opponent's ball and secure the largest number of points. It is mainly a game of skill. A less reputable game, in which skill is also essential, is played in many saloons of the baser sort. It is called Morra, and consists in flinging down the hand violently and at the same time extending one or more of the fingers and shouting the number of fingers extended, this constituting a challenge to other members of the group, who duplicate the movement as accurately as possible. If any one fails in accuracy, he loses. The impetuous character of the contestants, however, frequently leads to threatening altercations and occasional serious results. On this account this game is subject to a general prohibition in Italian cities. Many Italians have an unfortunate passion for games of chance, which has, no doubt, been strengthened by former indulgence in the national Banco Lotto at home. The holding of raffles for bicycles, sewing-machines, gold watches, etc., is common, and the successful numbers in what are practically lottery drawings are published in the Italian dailies.

The Italian churches of New York are mainly attended by women, but few of the men being enthusiastic over the work of the priests. The most important of these churches is that of St. Anthony of Padua on Sullivan Street, ministered to by Anacletus de Angelis, with four assistants. Its parishioners number 8,000, and it holds property valued at $400,000. Near by on Bleecker Street is the Italian church of Our Lady of Pompeii, while that of Our Lady of Loretto, "where many miracles have occurred," numbers more than 12,000 supporters. Our Lady the Queen of the Angels is another church on East One Hundred and Thirteenth Street. The largest Protestant body of Italians in the city is that under the leadership of Dr. A. Arrighi, of the Broome Street Tabernacle, who has labored almost twenty years in this field.

Education is of course necessary before any Italian can thoroughly appreciate the rights and duties of American citizenship, and the educational problem for Italian immigrants is a serious one. Many boys and young men arrive at Ellis Island at an age which enables them to escape army service at home and school attendance in this country. Working all day among those using only their own dialect, they often go for years without acquiring more than a few English words. The brightest young men enter the public night-schools as soon as a speaking acquaintance with the language is formed. Indeed, the public night-school already furnishes a few Italian-speaking teachers for the benefit of these people. But there is a large margin of uncovered territory to be occupied by settlement workers. The Children's Aid Society maintains three large and crowded Italian schools in Manhattan, of which that on Leonard Street, with 600 scholars, is the oldest and best equipped. Brooklyn, on the other hand, has but a single Italian settlement house, still inadequately supported, and forced constantly to appeal to the public for aid. It is something that public-spirited men in the Borough of Churches should look to.

The trades and occupations of New York Italians are various, so that there is slight excuse for the query put by a university man who, noting the dark-featured venders patrolling the streets with push-carts, asked, "Why do all Italians deal in bananas?" In reply it may be said that the push-cart men of lower Broadway and Wall Street are nearly all Greeks, most of the Italian dealers in fruit now having stands or stores of their own. But to-day there are in Manhattan some 2,300 Italians devoted to the trade of St. Crispin; 1,300 who deal in cheese and groceries; 1,500 tailoring-shops and 3,000 barber-shops; a total of 500 butchers and bakers, and as many more who keep saloons; 200 tobacconists; and over 600 who keep fruit-stores.

We have spoken of our metropolitan Italians only, but New York State contains outside of the city nearly half as many as reside within its limits. It may be said, indeed, that there is scarcely a growing town or city from Plattsburg to Chautauqua which lacks a group, and frequently a good-sized group, of these people. Buffalo heads the list with an Italian population of 13,800; and if we include those who live at Geneva, Batavia, North Collins, Fredonia, etc., the total number in that section is about 22,000. Great numbers work on the Lehigh Valley railroad; 400 are engaged in a single

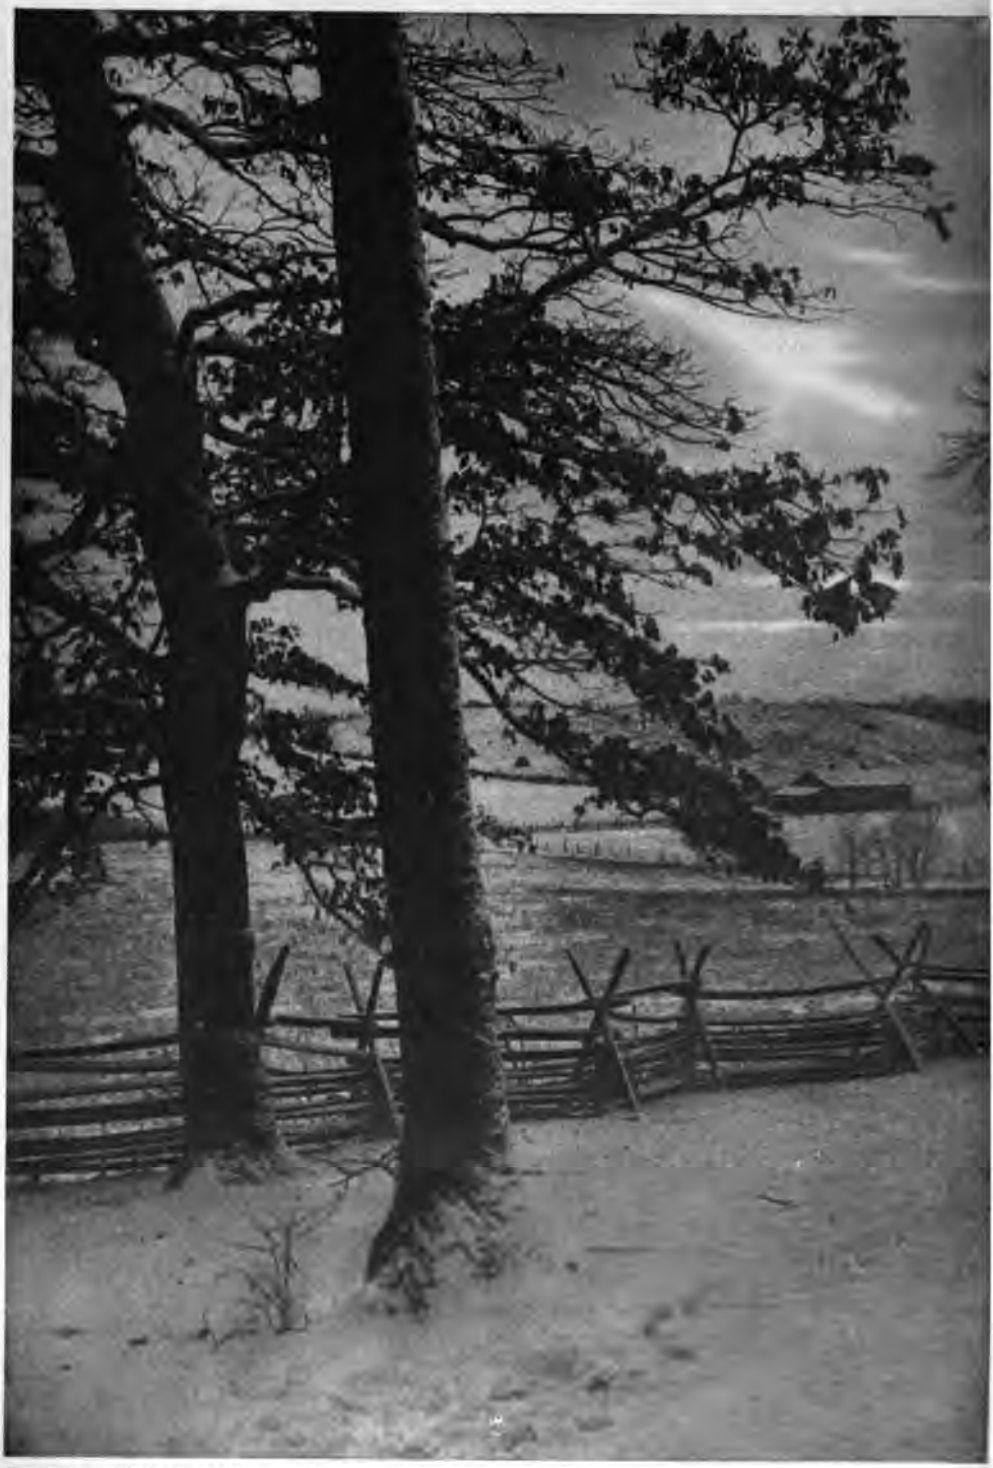
steel-factory, and the supply of Italian toilers with the pick and spade about equals the demand. In the central and southern portions of the State there are estimated to be 25,000 more, while in Albany, Troy, and Utica (with a specially large colony), and in the southern Hudson River towns, there is an additional total of 18,000.

The Italians of New England are quite generally engaged in factory work. Thus, the shoemakers go to Lynn, Haverhill, Brockton, and East Weymouth in Massachusetts; while the marble workers and stone-cutters throng to Quincy, Milford, and Bay View, and the silk workers to Lawrence and Fall River. The immigration to Massachusetts is more largely from Genoa and the north than is that centering in New York State, for the New England quarries draw hundreds of workmen directly from the marble hills of Massa-Carrara in Tuscany, while the silk-mills of eastern Massachusetts attract the silk workers of Lucca and adjoining Tuscan towns. Boston has an Italian population of 25,000 and New Haven a colony of 12,000, while the factory towns of the Connecticut Valley—Hartford, Waterbury, Meriden, Danbury, Derby, and Ansonia—have each permanent settlements of from 1,000 to 4,000 persons. The New Jersey colonies at Hoboken, Hackensack, Passaic, Paterson, and Jersey City are growing rapidly. In the last-named place Italians occupy several important political positions, and their Fifth Ward Republican League has an enrollment of five hundred names. Here a police captain, the clerk of the City Hall, and a Justice of the Peace are Italians, while at Hoboken their race is represented by a health inspector, health commissioner, school commissioner, public works commissioner, assessor of taxes, and a commissioner of the police board. Here are a number of large Italian factories, while considerable real estate is held by the older residents. At Union Hill, West New York, and Homestead several thousand Italians are

employed in the silk-mills. The larger part of these people come from Piedmont and Lombardy, where silk-weaving is the principal industry. Skilled labor of this kind requires a considerable degree of training and adaptability, and there is undoubtedly more intellectual activity among New Jersey Italians than among those engaged in the Pennsylvania coal-mines or on the railroads. Coming from northern Italy, they generally possess a common-school education, and their literary and argumentative tastes find expression in the newspapers which they publish at Paterson, Newark, and Jersey City.



Philadelphia is, after New York, the largest center of Italian population in this country. Some twelve thousand of these people occupy twenty blocks in the southern part of the city between South Fifth and South Fifteenth Streets and along Christian, Fitzwater, and Bainbridge Streets. The total Italian population is estimated at 45,000. They sustain sixty-six mutual aid societies, and their chief organ is a daily newspaper, "Mastro Paolo." Other journals are, "La Liberta," "La Voce della Colonia," and "Il Vesivio," a rather volcanic sheet. Thirty miles southeast of Philadelphia, at Vineland, N. J., is a large settlement of thrifty Italian agriculturists, who own several thousand acres devoted to vines and small fruit. It is sometimes wrongly assumed that our Italians prefer to settle in the Eastern States and do not go far West. But Italians are numerous in Detroit, and at Denver there is a colony which sustains three Italian newspapers, while that at Pueblo publishes another. In Galveston and New Orleans are large bodies of these people, and California has an Italian population of fifty thousand, mainly devoted to grape and fruit raising. These last are chiefly North Italian vine-growers.

Of the Italians of Chicago we need not speak, for Miss Jane Addams, of Hull House, has already pleaded their cause with ability. She says: "There are women's clubs in Chicago which study Italian history, read Dante, and go into the art of Italy, but fail to know that right at their doors is this very interesting colony of ten thousand South Italians, reproducing their country's habits and manners, carrying on their transplanted life with a great deal of charm and a great deal of beauty, and yet these women's clubs know nothing about them. These colonies are just as interesting, just as worth while making an effort to know, as is village life in Italy. We lack imagination. We change the color of our tablecloths and the shades of our candlesticks in order to get a variety in our social life, and yet here are these people full of color, charm, history, who with their new life would offer a genuine addition to our own life and give us a type of social endeavor and stimulus."

THE MARIONETTE SHOW

Here is given night after night a play that extends through an entire year. It is usually found

"WHEN MORNING DAWNS, THE CLOUDS BREAK AND THE SUN STRUGGLES FORTH TO LOOK UPON A NEW EARTH"

On Being Abroad in Winter

By Oscar von Engeln

Illustrated with Photographs by the Author

WHEN the first few snowflakes float downward in November late, we watch them strainedly; something seems to grip at our hearts. For then first we realize that winter has surely come; that for a long time, aye months, we must bid good-by to the fair summer weather. Before the advent of those white harbingers we walked in the idyllic days of Indian summer, hypocritically asserting, with an air of conviction, "This weather cannot last; to-morrow will be winter." Yet all the time our hearts belied us; deep in our breasts we exulted at every warm day, and lived each night through in the hope that the sun would rise again to-morrow from out those yellow mists wherein it and the earth had both disappeared in the evening. Yet, as week succeeded week, and ever the wind blew softly, even the brain grew sanguine, and the tongue said, "It will be a very late and mild winter." Perhaps, even, there was planned yet another all-day excursion afield, to breathe in full the lusty autumn odors.

And now—now snowflakes are falling. We stand at the window with inheld breath, while a few more slowly descend. Out of the west gray-black clouds have come; the wind is no longer a friend; his manner has a quality of disagreeableness, not of cold, which hurts us. In those moments we cast aside, utterly, all our summer dreams. And, after the first pang of such a parting, we turn and say to our fellows, oh, so blithely, "Hello! snow's falling; won't those hills look fine all covered with white?" Thus deftly are we ever off with the old love and on with the new.

The herald flakes melt ere they have barely touched the ground. After a few brief seconds the sun again shines; the scene is the same, yet the view has changed, the world is different. The joy of life is now in futures; with the coming of those few crystals we date a new time. Some weak days of watery sunshine follow. Then—

A night closes in after a gray all-day, and the twilight atmosphere is filled with a myriad flecks of white. A hush descends o'er the land; only the soft murmur of breathing snowflakes is heard. One by one, distant landmarks fade out. Already a thin veil is spread over the surface of earth, a winding sheet for the few lonely survivors of the plant relationship. The air temperature hovers between freezing and thawing. A puff of wind from the northeast; colder, and with it a gust of snow. A quiet again filled with heavy, straight-down-falling flakes. Then the wind rises, slowly at first, giving the flakes only a slight slant in their descent. As the night grows late, the hurrying flakes fall ever faster, the wind roars and howls among the trees in crescendos, and again decreases to a minor wail. Anon a blast buffets its way with dull thuds as it sweeps past. The storm is at its height, and out in the darkness the flakes are being hurled into up-rearing drifts, only

BEFORE THE SNOW COMES

WHEN THE SNOW MELTS

to be overthrown by a vagrant eddy. Ceaselessly, relentlessly works the wind, shifting the folds of white.

When morning dawns, the clouds break and the sun struggles forth to look upon a new earth. The air is frosty, keen, and fresh. The wind still hurries over the new white surface, altering, smoothing, building banks and filling hollows. In the wide sweep of his arms he gathers all the erring snowflakes, and tumbles them hither and thither until he has them safely in their appointed resting-place. How they dance in the early light-beams, up and down, glitter and spangle, and away to yonder drift; one after the other—miniature clouds of diamond-dust, corralled by the indefatigable wind-master.

There is a charm about this snow cover which cannot be clothed in words. As we step out into its dazzling expanse, our feet sink yieldingly, as if we were walking on cushions. With each step this seems an ever new experience. 'Tis fine to tramp a nice fresh patch of snow. When the layer is deep and feathery, every pull-up of the feet results in the scatterment of small snow clumps, which break in a wonderful manner the monotony of the iridescent mass. Among the clumps the light seems to linger lovingly, making the way pregnant with possibilities to the observing eye.

Then there is the novelty of making new lines, all one's own, in the landscape, which claims our attention, and wholly captivates us for many a day. Those snow-paths, what stories they tell! Did we ever dream our wanderings were so eccentric as the snow-trail tells us! Right and left, doubling for a view, avoiding an obstacle, jumping a hollow; we gaze back in surprise at its convolutions—and laugh.

The absence of odor strongly characterizes the winter months of the year; especially those during which snow covers the earth. Spring has its incense, summer its heavy perfumes, autumn glories in a number of elusive scents, winter has none. Just a freshness of the air, a clearness which brings with every breath tonic qualities. The first few dips we take of its cold purity hurt the summer-balm pampered nostrils. Yet how soon those inspirations set to rights our befuddled b[illegible] swell the chest as never did a softer atmosphere! The nostrils dilate, the eyes dance, ears tingle, rosy cheeks come; now it is winter, this is its charm.

The little paths which wound so invitingly from the edge of the meadow to the wood have all disappeared. So here we resolve to dispense with crooks, and strike out in a straight line for the trees. We enter the woods; what a transformation! The forest has become a jewel-laden feminine thing! Bough and bole, limb and twig, every line is repeated in white. We look from the edge of this forest beautiful across the valley, and the distances seem wonderfully clear and distinct. Yon house those ungarnered shocks, which faded so indistinctly into the brown earth a few weeks ago, now stand forth in sharp silhouette. It is a glorious privilege, this looking forth over a broad expanse of snow, scintillating or fading into grayness, alternately, as clouds hide the sun's face. What a burst of brilliance, when but one spot in the center of the field receives of a sudden the sun's uninterrupted rays! A gem of dazzling fire set in dull metal is the feeling it conveys.

Within the woods all is still, as if the trees were afraid to move—like a fine lady fearful of disarranging her ornaments. Under the trees, around the bushes, and along the fence-rails, are marked many trails: tracks of small paws, of hopping birds, and sometimes the larger three-hole of the rabbit. Did you ever follow them? was it not fascinating? Here in the deep woods we who are acquainted may dig down and find that faithful evergreen, the Christmas fern. Perhaps we have not noted the absence of color in this great panorama of black and white; but at sight of this one note in green, how it all comes back with a surge—our color-longing! We find pleasure in the sight of vivid seed-berries of the bittersweet, pendent still on their long, slender threads from stalks of green. They and the red berries of the wild rose afford the brightest colors in winter's domain.

A cloudy gray day is the time to look up. Then there is no sun to hurt, no glare which blinds the eyes. We may explore the tree-tops with assurance. Trees are trees only in winter. Then they have individuality. Each skeleton body is outlined against the sky, the limbs sweeping in bold curves, interrupted at times by

subtle angles. The edge of the wood in the distance forms a delicate tracery. This is the time of the forest monarchs' pride; they bow not now to any storm, as they did in summer-time, when hampered by their feminine leaf consorts. Now they are bachelors, all this doughty band, and though they sway to the passion of the winter's blast, they yield not one jot in their sturdy masculinity.

We notice now, too, the weeds and small bushes with their curious branchings, their solid phalanxes of black, against the encompassing white. The pepperidge with its irregular growth, and the ironweed furnishing studies in vertical lines, make interesting foregrounds which we never saw with seeing eyes before. How great is the similitude between a growth of weeds and the forest; size only differentiates them, otherwise they are the same. Were we giants, the trees would present much the aspect the weeds do now.

In the bushes we note many last year's birds' nests quite close to earth. Empty and deserted, yet withal cunning things. When last summer we saw the birds disappear in these same shrubs, and searched diligently for their homes, we found nothing. Yet here they are with their mask of leafage removed, the most conspicuous objects in the clump. We resolve to bear this in mind and search with greater exactness next time.

Of the birds themselves, only the crows, the sparrows, and those delights, the cardinals, remain. Of all the bright summer birds, the cardinal alone stays to cheer us in those latter days of winter when the increasing bleakness of the view numbs the hungering eye.

For, to confess, is not the day when the snow melts in rushes from the hillside, and the little brook leaps and tumbles the water down over its yet icy bed, a wonderful day? The winter has grown long, we are half benumbed, a lethargy attacks us, and then comes this day of exultation—the snows are melting: spring is again at hand!

"THE FOREST HAS BECOME A JEWEL-LADEN FEMININE THING"

The New French Ambassador

The successor of M. Jules Cambon as Ambassador from France at Washington is M. Jean Jules Jusserand, the well-known writer on English society and literature. During recent years M. Jusserand has been Minister to Denmark. The other day at Copenhagen he was approached by Princess Waldemar, daughter of the Duc du Chartres. As the only Frenchwoman at the Danish court, she had just received a new book from Paris which was exciting great attention there. The book was none other than a translation of President Roosevelt's "Strenuous Life," and the Princess asked the Minister if he knew the author. The Minister replied: "No, I do not know him yet, but this very morning I received the announcement of my transfer to Washington, so I hope soon to become acquainted with him." Before going to Copenhagen, M. Jusserand was Consul at London, and was afterwards Counselor of the French Embassy. During his many years in England he improved his opportunities of studying English literature and life; the results of his study may be gathered from the titles of some of his books, "La Vie Nomade et l'Angleterre au Quatorzième Siècle" (crowned by the French Academy), "Les Anglais au Moyen Age," "Le Roman Anglais," "Le Roman au Temps de Shakespeare," and "Le Théâtre en Angleterre." Some of these books have been translated into English. M. Jusserand is thus a type of the scholar-statesman, a type to which belong such names as Bancroft, Motley, Lowell, and Andrew White—names which have dignified the annals of American diplomacy.

THE NEW AMERICAN NAVY[1]

By JOHN D. LONG

SECRETARY OF THE NAVY FROM 1897 TO 1902

THE ORGANIZATION AND EDUCATION OF THE NAVY

THE effectiveness of a navy depends vitally upon the efficiency of its personnel. Provided with war-ships of latest construction, a service made up of officers and men inadequately trained and lacking spirit is half way toward defeat. Composed of inferior vessels, manned by experienced and resourceful officers and men, a fleet may wrest victory from a physically stronger enemy.

The history of the United States and that of Spain, foes in 1898, furnish many instances of valor and intelligence overcoming numerical and material superiority. Philip of Spain saw his Invincible Armada harried and finally scattered by the smaller command of Howard and Drake. Three hundred and ten years later, a queen holding in trust the scepter Philip once wielded sent to annihilation a squadron of war-ships as modern in construction and armament as were in their day the wooden vessels despatched by the earlier monarch to subjugate England. The force of 1588 sustained reverse because it was deficient in sailors; that of 1898 suffered total destruction because it lacked engineers.

No such disasters as befell the navy of Spain have yet clouded the navy of America. The cycle from our Revolution to the Spanish-American War is bright with shining deeds, the fruit of the gallantry and skill of the men who did them. What can be more inspiring than the intrepidity of John Paul Jones as he stands on the deck of the shot-torn and sinking Bon Homme Richard, shouting orders to his men, who are working like demons at such guns as are yet unmounted by the enemy's fire? Above the noise of booming cannon and the sharp rattle of musketry and the hoarse cries of infuriated crews he hears the hail from the smoke-hidden Serapis:

"Has your ship struck?"

And then the laconic reply:

"I have not yet begun to fight!"

It was not a question of that courage which is so common, but of that nerve which endures to the end and without which the ordinarily brave man flinches from the ultimate test and responsibility.

Outside of Boston Harbor the unlucky Chesapeake, manned by a green and heterogeneous crew, is wildly firing at the well-disciplined British frigate Shannon. Lawrence is struck and is borne below.

"Don't give up the ship!" he cries. "Tell the officers to fight to the last. Never strike the colors. They shall wave while I live."

The Nation is rent by civil war. Under a rain of shot and shell, a Union fleet steams into Mobile Bay. The first ship, the Brooklyn, falters.

"What's the trouble?" is shouted from the flagship, the Hartford.

"Torpedoes," is the explanation, trumpeted in reply.

"Damn the torpedoes!" exclaims Farragut. "Four bells. Captain Drayton, go ahead. Jouett, full speed."

The dawn glows on the Bay of Manila on the first of May, 1898. An American squadron, which it reveals, steams straight for a Spanish force lying under the batteries of Cavite. Soon shell are hurtling toward it, but, falling short, expend their

This is the third of a series of twelve papers to appear in the Magazine Numbers of The Outlook. Other papers will be: The Administration of the Navy, The Preparation for the War with Spain, The Battle of Manila Bay, The Blockade of Cuba, Bottling up Cervera's Fleet, The Battle of Santiago, Valiant Deeds in the War with Spain; Samoa, the Philippines, and China; Recent Naval Lessons.

energy in the water. When the proper range is reached, Dewey turns and quietly remarks:

"You may fire when you're ready, Gridley."

Courage has been always a characteristic of the American sailor, but it alone was not responsible for victories achieved by our men-of-war over those of enemies no less brave. In the days of the sailing ship the superiority was due, in an important degree, to the greater skill with which the ship was handled by experienced officers and its crew of hardy longshoremen. Hull won as much distinction in sailing the Constitution as in fighting her. The native intelligence, the quick eye, and the supple limbs of the men, born and bred in the salt air of the Atlantic coast, easily worked the simple guns of the day. Raw material is not so easily convertible into the experienced man-o'-war's-man of the twentieth century. The abandonment of sails and the substitution of steam and electricity, with the countless improvements accompanying the change, have created in the war-ship of the new navy a demand for a mechanic-sailor—that is, a man trained in the operation and repair of fighting machinery, yet impregnated with the salt of the sea. Ability to navigate and sail a ship was the first requisite of an officer and a seaman of the old navy; to-day they are engineers and mechanics first, and sailors afterwards. A modern battle-ship from stem to stern is simply a huge fighting machine. It is propelled by machinery; its turrets, themselves machines, are operated by machinery; the guns are loaded and fired by machinery; the torpedoes, complicated engines, are sent on their careers of destruction by machinery; small boats and anchors are lowered and hoisted by machinery, and water-tight compartments are opened and closed by machinery.

Steam and electricity are the powers which move this terrible creature of man's destructive genius; and steam and electrical engineers are required to guide and supervise its operation. An officer's duties are not, however, limited to the practical application of these sciences. He must also know how to navigate his ship and be able to care for the health and general well-being of the men under his command. Occasions arise when he must conduct negotiations for the settlement of important diplomatic questions, and he frequently represents the Government at functions of international consequence. He rescues the shipwrecked, gives assistance to the national merchant marine, and, if called on, quells its mutinies. He surveys dangerous coasts, makes deep-sea soundings for the triple purpose of finding a suitable bed for a projected cable, charting the bottom of the ocean, and promoting ichthyology. He determines for navigators the longitude and latitude of doubtful points. He should have at least a rudimentary acquaintance with astronomy, and understand something of chemistry and metallurgy. Because legal questions are sometimes raised by or referred to him, and because he serves on courts martial and administers punishments, he ought to be familiar with the principles of common law. Above all, he must be a man of quick decision, of nerve, and of sound judgment, for, as commanding officer of a battle-ship or even a vessel of inferior class, he should know in battle when to strike and strike sure; in peace, how to determine an important question affecting the honor of the Nation which is brought to him for immediate settlement.

I have described the attainments of the ideal officer, but it does not follow that every member of the commissioned force of the navy possesses them. At the same time, the preliminary education given at the Naval Academy and the subsequent training in active professional life insure the development of an officer, provided he can and will improve his opportunities there. It is the proud boast of the American navy that in its existence of more than a century in but few instances has the man been wanting when the occasion for him came.

The personnel of the navy of the United States was created simultaneously with the authorization of the first war-ships of the old navy. The Act of Congress of March 27, 1794, directed that "there shall be employed on board each of the ships of forty-four guns, one captain, four lieutenants, one lieutenant of marines, one chaplain, one surgeon, and two surgeon's mates; and in each of the ships of thirty-six guns, one captain, three lieutenants, one lieutenant of marines, one surgeon, and one surgeon's mate, who shall be

appointed and commissioned in like manner as other officers of the United States." Thus was formed the Line, and the Marine, Medical, and Chaplains' corps. The "purser," an enlisted man, was to develop into the paymaster. An experienced ship-builder was needed to design and construct the first ships, and Joshua Humphreys was appointed a naval constructor and assigned to duty. As the navy grew, additional constructors were required, and the men employed for construction work were eventually given commissions. Taking advantage of a law authorizing the appointment as assistant naval constructors of any cadets who had graduated with distinction in the Mechanical Department of the Naval Academy, Cadet Engineer F. T. Bowles, in 1879, applied for an appointment, and also requested permission to attend the Royal Naval College at Greenwich, England, which had an advanced course in ship-building, The older constructors opposed Mr. Bowles's ambition, but grit and persistency gained for the young cadet a victory of the greatest importance to his corps. Only leading graduates of the Academy have since been assigned to the construction corps—none from civil life. The professors of mathematics—now an anachronism in the military organization of the navy—were originally teachers on board ship of midshipmen of the old navy. They no longer follow the sea, and their duties are civilian. Of the fifteen officers of this corps in November, 1902, eight are on duty as teachers at the Naval Academy, one is director of the Nautical Almanac, and the remainder are connected with scientific work of the Naval Observatory. Congress should provide that no further appointments be made to this corps, as all its work can be procured from civil life, and the anomaly of a pension or retirement for non-military service should be done away with.

Like naval constructors, civil engineers first received appointments from the Secretary of the Navy, and were liable to dismissal or removal at his pleasure. They, too, were at last made a part of the commissioned force. Civil engineers have many and important duties, relating principally to the planning and construction of naval stations. With the exception of the line and construction corps, appointments in the commissioned branch of the navy are made from civil life. Medical officers are selected at large, after a thorough examination. President McKinley approved my recommendation that appointments of civil engineers, assistant paymasters, and professors of mathematics should be made after competitive examination. In this connection it may be said that it is difficult to see why any of the various staff officers, who as a corps never go to sea, should have military rank or title.

The commissioned personnel of the first ships of the old navy was formed during the administration of Presidents Washington and Adams. The midshipmen, who were designed to be the future captains, were all of tender years when appointed, and, without preparation, were sent on board ships either fitting out or about to sail in search of the enemy. Yet the need of mental education for the youngsters was great, and fitful attempts were made to provide it. Congress having refused to establish a naval school the Navy Department in 1802 prescribed in regulations the duties of schoolmasters; but schoolmasters were not appointed. When, in 1819, the Navy Department decreed that midshipmen must pass a professional examination in order to receive promotion to the grade of lieutenant, the country greeted the reform with gratification; the youths were affected with consternation. It was the thing for a "middy" during the greater period of his apprenticeship to apply himself to "doing what he was told, and doing it—quick"—a process which was frequently accelerated by a rope's end—and to devote as much time as he could spare in the six months prior to examination to the study of the theory of seamanship. This theoretical education was obtained from a few books on mathematics and navigation, and sometimes from the kindly help of a superior. In "The United States Naval Academy," written by Mr. Park Benjamin, whose full and excellent history of the Naval Academy I have followed, the author thus describes the examination of Midshipman Joseph Tatnall:

"Commodore: 'Mr. Tatnall, what would be your course, supposing you were off a lee shore, the wind blowing a gale, both anchors and your rudder gone,

HON. JOHN D. LONG
Secretary of the Navy from 1897 to 1902.

all your canvas carried away, and your ship scudding rapidly toward the breakers?'

"Tatnall: 'I cannot conceive, sir, that such a combination of disasters could possibly befall a ship in one voyage.'

"Commodore: 'Tut, tut, young gentleman, we must have your opinion supposing such a case to have actually occurred.'

"Tatnall: 'Well, sir—sails all carried away, do you say, sir?'

"Commodore: 'Aye, all—every rag.'

"Tatnall: 'Anchor gone, too, sir?'

"Commodore: 'Aye, not an uncommon case.'

"Tatnall: 'No rudder, either?'

"Commodore: 'Aye, rudder unshipped.' (Tatnall drops his head despondingly in deep thought.) 'Come, sir, come—bear a hand about it. What would you do?'

"Tatnall: (At last and desperate.) 'Well, I'd let the infernal tub go to the devil, where she ought to go.'

"Commodore: (Joyously.) 'Right, sir, perfectly right! That will do, sir. The clerk will note that Mr. Tatnall has passed.'"

A temporary Government school for educating midshipmen was organized in 1821. Seventeen years later Secretary Paulding established a preparatory school in the Naval Asylum, a home for aged seamen, at Philadelphia. To this school boys were sent for instruction for a period of eight months, after which they were ordered to sea. Aside from the fact that it marked an advance in naval training, this school is remembered to-day because it caused the connection with the navy of William Chauvenet, who was appointed

professor of mathematics and navigation. When employed, Professor Chauvenet was only twenty years of age; but he instituted reforms, introduced order and system, and extended the scope of studies. Despite the failure of efforts which had been made since the navy was created to obtain authority of law for the establishment of a school for the education of midshipmen, Professor Chauvenet threw himself into the project with all the enthusiasm of youth, and drew up a plan requiring no legislation and no additional cost, for an institution the curriculum of which included every subject a naval officer of the day required to fit him for his duties. Mr. David Henshaw, Secretary of the Navy in 1844, adopted the scheme, which contemplated a two years' course of instruction, but it did not not go into operation because Secretary Mason, Mr. Henshaw's successor, revoked the order. This action was taken upon advice given by older officers of the service, who insisted that the midshipmen were needed on board ships, and that as their future duties were connected with the sea, the sea was the only school in which they should be taught.

Many causes were operating to bring into life the seed which Professor Chauvenet had sown. The introduction of steam, the scandalous conduct of many officers, the lax discipline, brutality, and oppression which existed afloat, and finally the tragedy of the brig Somers, when Midshipman Spencer, son of the Secretary of War, and two enlisted men were hanged on the charge of plotting mutiny, established the necessity of a method by which reputable boys could be appointed, and receive a moral and mental education which would enable them to conduct themselves with honor and dignity, and reflect credit upon their country and service. Loudly as the press and citizens called for action, Congress did not respond, and it was left to the patriotic and far-seeing George Bancroft, of Massachusetts, to establish the Naval Academy.

Shortly after Mr. Bancroft entered the Navy Department, Professor Chauvenet brought to his attention the need of systematic education for midshipmen. The Secretary saw that to effect the adoption of the plan he must first conciliate the older officers of the navy. The service was induced to give its assent through a board of officers, to which Mr. Bancroft diplomatically referred the subject, and after the school was established and in operation on the military reservation of Fort Severn, at Annapolis, jurisdiction over which had been ceded to the navy, the Secretary asked Congress for an appropriation "for repairs, improvements, and instruction." The appropriation was promptly made by the House, but rumors were current that the Senate would decline to concur. Having great personal influence, Mr. Bancroft exercised it, with the result that the appropriation was granted and the Naval Academy legally established. From that day until the present there has been gradual improvement in the curriculum of the institution. It was one of the most important acts of my time when Congress, in compliance with urgent recommendations, authorized in 1898 the reconstruction of the Academy, at a cost not to exceed eight million dollars. The reconstruction is now in progress, in accordance with a plan prepared by a Board of Officers appointed by Secretary Herbert, although that official, on account of the condition of the National finances, considered it too comprehensive for immediate adoption. When the Academy is rebuilt, it will be an institution superior to anything of the kind in the world, and will meet every requirement of instruction and convenience. Prince Henry of Prussia, on the occasion of his visit to the United States in 1902, inspected the Naval Academy, and expressed to me surprise that we should be spending such a large sum of money on an educational institution rather than for men-of-war. It was with a feeling of patriotic pride that the response could be made that the resources of our country are so great that it can undertake, without anticipating embarrassment, the construction of an academy worthy of the personnel of which it is the source of supply, and yet have ample funds with which to continue the building of ships.

Since the establishment of the Naval Academy, more than two thousand five hundred midshipmen and cadets have been graduated, and the cost to the country has been about eight million dollars—a sum equal to that which will be paid for its reconstruction. That the organization of

THE ADMIRALS IN COMMAND OF THE NAVY DEPARTMENTS DURING THE WAR WITH SPAIN

the school has amply repaid the country is shown, first, by victories gained by our navy in the Civil and Spanish wars, and their far-reaching results, and, second, by the progress made in naval science, with its tremendous effect upon industrial development, for which many officers are to be credited.

The very nature of an officer's duties necessitates constant study of the subjects which they embrace. The course at the Naval Academy covers four years, and the cadets are then sent to sea for a two years' cruise, upon the expiration of which they return to undergo final examination. There is no good reason for more than one year's cruise at sea. At the end of that time, even if not at once upon graduation, the cadets should receive commissions as ensigns if found qualified upon examination. During his career at the Academy the cadet performs the duties of seamen and officers of every grade. He is carefully instructed in gunnery, navigation, and seamanship. He learns English and French, and now Spanish, as well as something about international law and history, becomes a proficient mathematician, and acquires a knowledge of physics, chemistry, and hygiene. Because the naval officer of to-day must be an engineer, he is thoroughly grounded in marine engineering, electrical and steam, and naval construction. When commissioned, he is on occasions given tours of duty at the torpedo station at Newport, where he receives instruction in the construction and operation of the torpedo, and at the Washington Gun Foundry, where he takes part in assembling forgings into great guns. He undergoes a post-graduate course at the Naval War College—an institution established at New London, Conn., almost simultaneously with the reconstruction of the navy. The Naval War College, like the Naval Academy, was not brought into existence by authority of Congress. Secretary William E. Chandler, under date of May 3, 1884, organized a Board of naval officers, consisting of Commodore S. B. Luce, Commander W. T. Sampson, and Lieutenant-Commander C. E. Goodrich, to report upon the subject of a post-graduate course for officers of the navy. Explaining to the Senate the reason for the establishment of the institution, Mr. Chandler stated that "the constant changes in the methods of conducting naval warfare imposed by the introduction of armored ships, swift cruisers, rams, seagoing torpedo-boats, and high-power guns, together with the more rigid methods of treating the various subjects relating to naval science, render imperative the establishment of a school where our officers may be enabled to keep abreast of the improvements going on in every navy in the world." In its report recommending the organization of the institution the Board expressed the opinion that "a cogent reason for such a school is that there may be a place where our officers will not only be encouraged but required to study their profession proper—war—in a far more thorough manner than has ever heretofore been attempted, and to bring to the investigation of the various problems of modern naval warfare the scientific methods adopted in other professions." The course at the College is divided under two heads—the science and art of war, and law and history. The College has been in successful operation for fifteen years, and has been of much benefit in fitting officers not only to command single ships and squadrons, but to perform properly numerous other important duties with which they are charged. I am confident that the training many officers received at the College has been of great service to them in times of peace and war. Toward the close of my administration instructions were given for the establishment of a post-graduate course in steam engineering at the Naval Academy. This was done upon the recommendation of Rear-Admiral G. W. Melville, the engineer-in-chief of the navy, and the course will enable officers of the new line to perfect themselves in the science of their profession. The medical officer was not overlooked, and a medical school was established in Washington. Arrangements were made with the War Department for harmonious co-operation with the medical school of the army. Medical officers of the navy have had no sufficient opportunity to study their profession, and co-operation with the army will not only fill this want but create a healthy mutuality which will stimulate both services.

In the navy to-day there is missing from the list of titles of officers one which

for half a century occupied an honorable and increasingly important position upon it—that of engineer. The introduction of steam into the navy caused the appointment in 1836 of Mr. Charles H. Haswell, of New York. He was the first engineer of the service. In spite of the element in the navy and the country which clung to sails, it speedily became apparent that steam propulsion must be adopted for men-of-war, and about 1842 Congress had authorized the construction of four steam vessels—the Fulton, Mississippi, Missouri, and Michigan—and one steamship, known as the Engineer, had been purchased. For the design of the machinery of the vessels the construction of which was authorized, and for its care and operation after installation, twenty engineers were appointed. The engineers were dissatisfied with their status and pay, and the appointment of a man who was not familiar with the principles of their profession; and an appeal was made to Congress for adequate recognition. Agitation was effective. Congress, by the Act approved August 31, 1842, created the staff engineer corps of the navy. This act provided for the appointment by the Secretary of the Navy of one chief engineer, two first assistant, two second assistant, and three third assistant engineers for each steam ship of war, to be paid salaries ranging from $1,500 to $500 per annum. Three years later a law was enacted authorizing the President to appoint engineer officers, and in 1860 Congress granted substantial increases in pay to officers of this corps. In the meantime the question of the relation of the staff to the line had become a subject of controversy, and Secretary Toucey, in January, 1859, issued an order announcing the relative rank of officers of the staff corps. This order explicitly stated that it conferred no authority to exercise military command "except in the discharge of their [officers of the staff corps] duties, and no additional right to quarters." Congress enacted Mr. Toucey's order into law, striking out the words "except in the discharge of their duties," and thus, the engineers claimed, increased their embarassment and difficulty in controlling and disciplining the men of their divisions. The value of steam propulsion had been demonstrated before the Civil War, but the events of that struggle emphasized its superiority over sails, and established the fact that men especially trained in the manipulation of engines must be employed. When the Naval Academy was founded, Lieutenant James H. Ward, a member of the faculty, foresaw the important part steam would play in the future service, and arranged that it should be one of the principal subjects of the course. With his detachment from the Academy less attention was paid to steam, and it was soon made a subordinate branch of the department of Natural Philosophy. During the Civil War Secretary Welles called the attention of Congress to the desirability of educating steam engineers, and a law was enacted in 1864 authorizing the instruction at the Academy "as naval constructors or steam engineers of such midshipman and others as may show a peculiar aptitude therefor." Secretary Welles was not satisfied with the law, and he asked, before the plan was put into operation, whether steam engineering should not be made to constitute a necessary part of the education of all midshipmen, "so that in our future navy every line officer will be a steam engineer, and qualified to have complete command and direction of the ship." Here was the first official suggestion for the present consolidated line of the navy. The young men appointed under the Act of 1864 and enactments in the years immediately following were styled cadet engineers, and in 1882 they were transformed into naval cadets of the line.

This last law was intended to settle the line and staff controversy, which had been raging on board every war vessel of the navy, and which had already attracted the attention of thinking men of the country. So long as the engineers of the navy were appointed from civil life, it was plain that there could be no agreement between them and officers of the line bred in all the traditions of the service. The antagonism extended to the students at the Naval Academy, the cadet engineers among whom had been by law organized into a separate class, and the amalgamation of the cadet engineers and the midshipmen failed to produce the desired effect. Those graduates assigned to the Engineer Corps speedily became out of harmony with the line, and there was

little disposition on the part of the line to promote harmony by co-operation with the Engineer Corps. The difference in views between the two branches of the service appears very clearly in the testimony given before the House Naval Committee when it was investigating the question of reorganization of the personnel.

At the beginning of my term in the Department the discussion between the line and the staff was a matter of immediate importance. Naval officers naturally felt keen interest each in his own corps. The engineering profession throughout the country had become a party to the issue, and was demanding that its representatives in the navy should receive that measure of official recognition which the high character of the calling requires. Secretary Herbert had prepared a bill for the reorganization of the line, which contemplated the removal of a large number of officers by transfer either to a reserve or to the retired list, and by increase of officers, principally in the higher grades. A bill was also introduced granting actual rank, military title, and adequate numbers to the Engineer Corps. Neither the Herbert Bill nor the Engineer Bill had been adopted, and the condition I found was that of stagnation in promotion, with its train of evils, and the existence of friction between the line and the staff, which not only produced inefficiency, but which, through its effect upon Congress, almost endangered the upbuilding of the navy.

Representative Francis H. Wilson, of New York, the recognized champion of the engineers in the House, had frequent conferences with the Department in regard to the action which should be taken for the restoration of harmony in the service. Mr. Theodore Roosevelt—now President—was then Assistant Secretary, and was especially active in this direction, obtaining the views of rival factions. As a result of full consideration of this matter, I appointed a Board to which was confided the preparation of a plan for the reorganization of the personnel. Mr. Roosevelt was made president of this Board. Had a line or an engineer officer been named, the Board at the outset would have been embarrassed. By designating the Assistant Secretary, who was recognized as an earnest friend of the service at large, the line and the staff were certain of fair rulings upon questions which might arise between them. Mr. Roosevelt was intended to serve, and did serve, as moderator. The line was represented by two chiefs of Bureaus, Commodore Crowninshield and Commodore W. T. Sampson, and four other officers of standing and influence in the service—Captain A. H. McCormick, Captain Robley D. Evans, Commander J. N. Hemphill, and Lieutenant-Commander Richard Wainwright. The Engineer Corps, which comprised fewer officers than the line, was represented by four officers—Commodore George W. Melville, Engineer-in-Chief and Chief of the Bureau of Steam Engineering—a man of common sense, judgment, and possessing the implicit confidence of his subordinates—Chief Engineer Charles W. Rae, Chief Engineer George H. Kearny, and Passed Assistant Engineer Walter M. MacFarland. The Recorder of the Board was a line officer—Lieutenant Albert L. Key. No other corps were given representation on the Board, because the main question was between the Line and the Engineer Corps.

The Board was in session for about a month. The representatives of both the line and engineers manifested an earnest desire to come to an understanding. Commodore Melville submitted a proposition for an independent engineer corps, which should comprise 303 officers, who should have positive rank and military titles, and the same right of absolute command over their own divisions which watch and division officers of the line have, the chief of the Bureau of Steam Engineering to have the rank and pay of a Commodore. This proposal was rejected, and then Captain Evans submitted a plan which had all along been in the mind of the Department and of the Board, for the amalgamation of the line and the engineers. This solution, though at first sight revolutionary, was really the final step in the process of evolution through which the navy was passing. The fundamental studies of officers of the deck and engine room at the Naval Academy were identical; the younger line officers served in engine-rooms on torpedo-boats, and line as well as staff officers underwent training in machine work, if not in the engine-room, in departments devoted to electrical and

ordnance equipment. In the old days of sail, the naval officer was first of all master of the motive power: why not in the days of steam? The acceptance of the proposal by the engineers was followed by the drafting of the provisions of a bill to be laid before the Secretary for transmission to Congress. Examination of this showed that, besides providing for the combination of the line and engineer corps, it enabled the voluntary retirement of officers in the grades of captain, commander, and lieutenant-commanders, should natural causes fail to produce a certain number of casualties in those grades, and in that of lieutenant; and that should the casualties and voluntary retirements be not sufficient to cause the average vacancies fixed, then a Board of Rear-Admirals should select a limited number of officers for retirement. Whether voluntarily or compulsorily retired, the officers affected were to receive the rank and three-fourths of the sea-pay of the grade next higher to that which they had attained at the time of retirement. Here were two provisions that the Board contemplated enacting into law, which permitted valuable officers to go on the retired list, though it was plain that ships under construction would require when commissioned the services of all that could be gathered, and which also gave the benefits of retirement with increased rank and pay to officers who were unfitted for duty, and less deserving of such consideration than others retired because of disability incurred in the line of duty. I transmitted the bill to Congress with a recommendation for the enactment of its provisions, with the exception of those specified. It was believed that such a law would bring harmony into the service, and the results of its operation since enactment in 1899 have justified this belief. It still seems advisable that the voluntary and compulsory retirement provisions should be modified so that officers affected by them shall retire with the rank and three-fourths of the sea-pay of the grade held at the time of retirement, and not be given a premium for getting out of the service. The bill further provided that the navy should receive army pay, that the title "midshipman" should replace that of "cadet" for students at the Naval Academy, and that the course at the Academy should be reduced from six to four years. It created a corps of warrant machinists, and improved the condition of the enlisted force by conferring upon its members the same privileges and rights respecting retirement and pension that obtained in the army and marine corps. The enthusiasm aroused by sea victories during the war with Spain caused the enactment of the bill with some amendments and additions, the latter relating mainly to the marine corps.

It was loudly urged against this reorganization bill that it would operate to the disadvantage of the service; that the age was one of specialization, and that it was impossible to make a fighting man a "jack-of-all-trades." Those who made these statements forgot that in amalgamating the line and engineer corps we were simply repeating history; that England's ships were once sailed by men especially employed for that duty and fought by soldiers who had nothing to do with the operation of the vessels. But the combination of these two types produced the sailor who could not only sail his ship, but who could fight it as well. When steamships entered our navy, the sailor, clinging to the traditions of his calling, jealously refused to surrender his privileges and prerogatives to the engineer. As the work of the soldier and the sailor gradually approached each other and finally intermingled, so has that of the navigator and the engineer. The Personnel Law was framed to meet special conditions, and so long as those conditions exist it will produce the results intended; but when they change, it will require revision. It would not be surprising should the machinists warranted under the Personnel Law become a future engineer corps, just as the late engineer corps developed from civilians appointed into the navy during the early years of steam.

The officers command a ship, but the brawn and its intelligent application are supplied by the enlisted men. In the old navy the ships were manned by sailors who could patch a sail, knot a parted shroud, repair a boat, sponge, load, and fire a gun, in fact, do any work appertaining to their rating. Boys were enlisted as powder-monkeys and for other light work. That they were distinguished by the same ardor as possessed their older comrades is shown

by Captain Hull's report on the battle of the Constitution and the Guerriere, in which he said that "from the smallest boy in the ship to the oldest seaman, not a look of fear was seen. They all went into action giving three cheers and requesting to be laid alongside of the enemy." Enough American citizens not engaging in the national and merchant marines, causing the employment of many foreigners in this branch of the governmental and industrial services, the suggestion was made in 1835 that boys be enlisted and trained in the ways of the sea. Congress incorporated the suggestion into law in 1837, and under the authority granted him Secretary Paulding enlisted several hundred youngsters and distributed them among the line-of-battle ships Columbus and North Carolina and the frigates Java and Hudson. The plan was inaugurated under auspicious circumstances, but, the Department announcing that the apprentices would not receive commissions, interest disappeared and failure followed. A second effort to establish the apprentice system was made by Secretary Welles. The experiment at first produced gratifying results, justifying a belief in important future benefit to the service. Thinking an opportunity to attain commissions would encourage the boys, Secretary Welles, in his annual report for 1864, suggested that "from among the apprentices on the schoolship, a selection of one-half of the midshipmen appointed might be made with great advantage to the service and to the country. . . . It would popularize the service and open to those who may have enlisted the highest positions and honors in the service." Mr. Welles succeeded in having a number of apprentices sent to the Academy, where they were examined for admission; and some of the able officers to-day are those who underwent their first naval experience as enlisted boys.

Discouraging though the attempts of his predecessors were, Secretary Robeson, in 1875, issued a circular authorizing the enlistment of a certain number of apprentices. There was imperative need of such action. The percentage of foreigners in the navy at this time had reached such a high figure that confusion and inefficiency prevailed. Admiral David D. Porter thus described the humiliating condition of our enlisted force when the reconstruction of the navy began:

"A few years ago one of our ships with a cosmopolitan crew was anchored in the harbor of Villefranche. The crew represented nineteen different nationalities, and so inefficient was the organization that some wag painted on a board and hung in the gangway, "Ici on parle Anglais," like the signs in Paris shops. When the Trenton went into commission, as fine a body of Germans, Huns, Norsemen, Gauls, Chinese, and other outside barbarians as one could wish to see were on board. Of the whole number, not more than eighty could speak English. These men shipped for money. They had no sentiment for our flag or nationality, and possibly if it came to an action with a ship of their own or neighboring nation they would haul down the American colors and hoist their own."

National pride demanded an American navy. So the apprentice was encouraged. In 1881 the city of Newport ceded Coaster's Harbor Island in Narragansett Bay to the Government as a site for a Naval Apprentice station. During my administration the island of Yerba Buena, in San Francisco Bay, was acquired, and upon it a modern training station for apprentices was built. When Secretary Robeson made the third attempt to organize an apprentice training system, it was predicted that it would fail. To-day it is one of the important branches of supply for our enlisted force. It seemed a violation of the principles of the Republic to maintain a service which limited the achievements of an employee; and, regarding Secretary Welles's plan as eminently just and proper, I recommended that Congress enact a bill permitting the commissioning of enlisted men promoted from apprentices, after examination of their mental, moral, and physical qualifications. The law, as passed, fixes the number of these appointments at six annually. In the twenty-seven years during which the apprentice system has been in operation more than fifteen thousand boys have attended the course, and those who have not remained in the service have, in the majority of cases, made useful citizens. The apprentice system has also been important in bringing about the Americanization of the navy. Various

measures were adopted from the beginning of the new navy to displace the foreign element in the service. At the time of my entrance into the Department in 1897, almost twenty-five per cent. of the enlisted men were foreigners. As a means of reducing this proportion, enlistment stations were established in the interior of the country and along the lakes. The material thus obtained was of such an excellent character that when Congress made substantial increases in the enlisted force, these and additional stations were maintained. Recruits are placed on board receiving-ships, where they learn the rudiments of their future calling, and are subsequently distributed among training-ships. When their preliminary education is concluded, they are transferred to regular cruising vessels. Arrangements had been perfected before my retirement from the Department for the training of four thousand landsmen annually. Congress should authorize barracks for the accommodation of raw recruits. On shore, under the observation of officers, it will be an easy matter to reject those men who fail to show aptitude for the service, retaining only the best material to be wrought into the finished seaman. The effect of the enlistment of landsmen on the Americanization of the navy is shown by the fact that almost ninety per cent. of the enlisted force is to-day American by birth or naturalization.

Improvements in the *matériel* of the navy have brought about the necessity for an enlisted personnel of high intelligence and skill; and with these qualities has come the need of better provision for enlisted men. The sailors of the old navy were subjected to hard conditions; they are treated to-day as men. Fifty years ago they received whatever training was given them on shipboard. Even in the new navy, until 1897, only the torpedo school and the gun foundry were open to them. The use of electricity on board war-ships grew to such proportions during my time that it was deemed advisable to establish an electrical school at the New York Navy-Yard. The gunnery course was completed by practical training on the monitors Amphitrite and Puritan, in North Atlantic waters. To stimulate the men, the rating of gun captain was created. It is a gratifying fact that ships to which gun captains were detailed showed considerable and immediate improvement in target practice. The clerks of the navy are known as yeomen. That men enlisted for this rating might properly understand their duties, a yeoman's training-school was established at New York. One of the later acts of my time was the direction to establish at the Norfolk Navy-Yard an artificers' school. Here experience in ship-work will be given to carpenters, ship-fitters, blacksmiths, coppersmiths, ship's plumbers, and men of other ship's trades. That every ounce of coal may produce the largest volume of steam and that engines and boilers may not be rapidly worn out, a training-school was provided for firemen. The Cincinnati, whose bowels are one mass of machinery, was selected for use as this school.

No description of the personnel of the American navy would be complete without a reference to the Marine Corps. An early Continental Congress authorized the organization of a body of marines. The Congress of the United States, which directed the construction of the first ships of the old navy, simultaneously provided for the commissioning of marine officers and the enlistment of men for the guards. In all our wars the marines have distinguished themselves. On nineteen separate occasions Congress has, by joint resolution, expressed its sense of appreciation of their valor and good conduct. After the Civil War a movement was inaugurated to abolish the Corps, but a thorough investigation by Congress established the inadvisability of such action. Many line officers have expressed the opinion that the Marine Corps is no longer needed on board ships, and several years before the Spanish War the attempt to bring about its abolition was renewed. Colonel Charles Haywood, now Major-General, Commandant of the Corps, appeared before the Personnel Board in 1897 and earnestly opposed amalgamation with the navy. The Corps was reorganized and enlarged by the Personnel Law—action which met with general approval in view of the new laurels added to its record by the battalion which served at Guantanamo, where the Corps rendered especially brilliant service, as well as on the ships at Manila and Santiago, and ashore in China and the Philippines.

JOSEPH G. CANNON

Mr. Cannon will probably be Speaker of the House of Representatives of the new Congress. He has been a Member of Congress from Illinois for thirty years, with the exception of one two years' term. From a photograph by Clinedinst, Washington.

The Bodleian Library: 1602-1902

By Augustine Birrell

WITH what feelings, I wonder, ought one to approach in a famous University an already venerable foundation, devoted by the last will and indented deed of a pious benefactor to the collection and housing of books and the promotion of learning? The Bodleian at this moment harbors within its walls well-nigh half a million of printed volumes, some scores of precious manuscripts in all the tongues, and has become a name famous throughout the whole civilized world. What sort of a poor scholar would he be whose heart did not beat within him when, for the first time, he found himself, to quote the words of "Elia," "in the heart of learning, under the shadow of the mighty Bodley"?

Grave questions, these, but put, I am afraid, with a certain pomposity of style, for how else can I account for the undignified trick my memory is now playing me, by summoning to its bar that irreverent tale told of Calverley, then Blayds of Balliol? "The following episode occurred during one of Calverley's appearances at 'Collections,' the Master (Dr. Jenkyns) officiating. *Question.* 'And with what feelings, Mr. Blayds, ought we to regard the decalogue?' Calverley, who had no very clear idea of what was meant by the decalogue, but who had a due sense of the importance both of the occasion and of the question, made the following reply: 'Master, with feelings of devotion, mingled with awe!' 'Quite right, young man, a very proper answer,' exclaimed the Master."[1]

"Devotion mingled with awe" might be a very proper answer for me to make to my own question, but I, possessing that acquaintance with the history of the most picturesque of all libraries which anybody can have who loves books enough to devote a dozen quiet hours of rumination to the pages of Mr. Macray's "Annals of the Bodleian Library," second edition, Oxford, "at the Clarendon Press, 1890," cannot honestly profess to entertain in my breast, with regard to it, the precise emotions which C. S. C. declared took possession of him when he regarded the decalogue. A great library easily begets affection, which may deepen into love; but devotion and awe are plants hard to rear in our harsh climate; besides, can it be well denied that there is something in a huge collection of the ancient learning, of mediæval folios, of controversial pamphlets, and in the thick black dust these things so woefully collect, provocative of listlessness and enervation

[1] "Literary Remains of C. S. Calverley," ii.

and of a certain Solomonic dissatisfaction? The two writers of modern times, both pre-eminently sympathetic towards the past, who have best described this somewhat melancholy and disillusioned frame of mind are both Americans: Washington Irving, in two essays in the "Sketch-Book"—The Art of Bookmaking and The Mutability of Literature, and Nathaniel Hawthorne, in many places, but notably in that famous chapter on The Emptiness of Picture Galleries in "The Marble Faun."

It is perhaps best not to make too great demands upon our slender stock of deep emotions; not to rhapsodize too much; or vainly to pretend, as some travelers have done, that to them the collections of the Bodleian, its laden shelves and precious cases, are more attractive than wealth, fame, or family, and that stern Fate alone compelled them to leave Oxford by train after a visit rarely exceeding twenty-four hours in duration.

Sir Thomas Bodley's Library at Oxford is, all will admit, a great and glorious Institution, one of England's sacred places; and springing as it did out of the mind, heart, and head of one strong, efficient, and resolute man, it is matter for rejoicing with every honest gentleman to be able to observe how quickly the idea took root, how well it has thriven, by how great a tradition it has become consecrated, and how studiously the wishes of the founder in all their essentials are still observed and carried out.

Saith the Prophet Isaiah, "The liberal deviseth liberal things; and by liberal things he shall stand." The name of Thomas Bodley still stands all the world over by the liberal thing he devised.

A few pages about this "second Ptolemy" will be grudged me by none but unlettered churls.

He was a West Countryman, an excellent thing to be in England if you want backing through thick and thin, and was born in Exeter on the 2d of March, 1544—a most troublesome date. It seems our fate in the Old Home never to be for long quit of the religious difficulty—which is very hard upon us, for nobody, I suppose, would call us a "religious" people. Little Thomas Bodley opened his eyes in a land distracted with the religious difficulty. Listen to his own words; they are full of the times: "My father, in the time of Queen Mary, being noted and known to be an enemy to Popery was so cruelly threatened and so narrowly observed by those that maliced his religion, that for the safeguard of himself and my mother who was wholly affected as my father, he knew no way so secure as to fly into Germany, where after a while he found means to call over my mother with all his children and family whom he settled for a time in Wesel in Cleveland. (For there, there were many English which had left their country for their conscience and with quietness enjoyed their meetings and preachings.) From thence he removed to the town of Frankfort where there was in like sort another English congregation. Howbeit we made no longer tarriance in either of these two towns for that my father had resolved to fix his abode in the city of Geneva."

Here the Bodleys remained until such time as our Nation was advertised of the death of Queen Mary and the succession of Elizabeth, with the change of religion which caused my father to hasten into England.

In Geneva young Bodley and his brothers enjoyed what now would be called great educational advantages. Small creature though he was, he yet attended (so he says) the public lectures of Chevalerius in Hebrew, Bersaldus in Greek, and of Calvin and Beza in Divinity. He had also "domestical teachers," and was taught Homer by Robert Constantinus, who was the author of a Greek Lexicon, a luxury in those days.

On returning to England Bodley proceeded, not to Exeter, as by rights he should have done, but to Magdalen, where he became a "reading man" and graduated Bachelor of Arts in 1563. The next year he shifted his quarters to Merton, where he gave public lectures on Greek. In 1566 he became a Master of Arts, took to the study of Natural Philosophy, and three years later was Junior Proctor. He remained in residence until 1576, thus spending seventeen years in the University. In the last-mentioned year he obtained leave of absence to travel on the Continent, and for four years he pursued his studies abroad, mastering the French, Spanish, and Italian languages. Some short time

THE BODLEIAN LIBRARY AT OXFORD

after his return home he obtained an introduction to Court circles and became an Esquire to Queen Elizabeth, who seems to have entertained varying opinions about him, at one time greatly commending him and at another time wishing he were hanged—an awkward wish on Tudor lips. In 1588 Bodley married a wealthy widow, a Mrs. Ball, the daughter of a Bristol man named Carew. He survived her, and, having no children, a good bit of her money remains in the Bodleian to this day. Blessed be her memory! Nor should the names of Carew and Ball be wholly forgotten in this connection. From 1588 to 1596 Bodley was in the diplomatic service, chiefly at The Hague, where he did good work in troublesome times. On being finally recalled from The Hague, Bodley had to make up his mind whether to pursue a public life. He suffered from having too many friends, for not only did Burleigh patronize him, but Essex must needs do the same. No man can serve two masters, and though to be the victim of the rival ambitions of greater men than yourself is no uncommon fate, it is a currish one. Bodley determined to escape it, and to make for himself after a very different fashion a name, *ære perennius.*

I resolved thereupon to possess my soul in peace all the residue of my days, to take my full farewell of state employments, to satisfy my mind with the mediocrity of worldly living that I had of mine own, and so to retire me from the Court.

But what was he to do?

Whereupon, examining exactly for the rest of my life what course I might take, and having sought all the ways to the wood to select the most proper, I concluded at the last to set up my staff at the Library door in Oxford, being thoroughly persuaded that in my solitude and surcease from the Commonwealth affairs I could not busy myself to better purpose than by reducing that place (which then in every part lay ruined waste) to the publick use of students.

It is pleasant to be admitted into the birth-chamber of a great idea destined to be translated into action. Bodley proceeds to state the four qualifications he felt himself to possess to do this great bit of work: first, the necessary knowledge of ancient and modern tongues and of "sundry other sorts of scholastical literature;" second, purse ability; third, a great store of honorable friends; and, fourth, lei-

Bodley's description of the state of the old library as lying in every part ruined and in waste was but too true.

Richard of Bury, the book-loving Bishop of Durham, seems to have been the first donor of manuscripts on anything like a large scale to Oxford, but the library he founded was at Durham College, which stood where Trinity College now stands, and was in no sense a University library. The good Bishop, known to all book-hunters as the author of the "Philobiblon," died in 1345, but his collection remained intact, subject to rules he had himself laid down, until the dissolution of the monasteries, when Durham College, which was attached to a religious house, was put up for sale, and its library, like so much else of good learning at this sad period, was dispersed and for the most part destroyed.

Bodley's real predecessor, the first begetter of a University library, was Thomas Cobham, Bishop of Worcester, who in 1320 prepared a chamber above a vaulted room in the northeast corner of St. Mary's Church for the reception of the books he intended to bestow upon his University. When the Bishop of Worcester (as a matter of fact he had once been elected Archbishop of Canterbury—but that is another story, as Laurence Sterne has said) died in 1327, it was discovered that he had by his will bequeathed his library to Oxford, but he was insolvent! No rich relict of a defunct Ball was available for a Bishop in those days. The executors found themselves without sufficient estate to pay for their testator's funeral expenses, ever the first charge upon assets. They are not to be blamed for pawning the library. A good friend redeemed the pledge and despatched the books, all, of course, manuscripts, to Oxford. For some reason or another Oriel took them in, and, having become their bailee, refused to part with them, possibly and plausibly alleging that the University was not in a position to give a valid receipt. At Oriel they remained for ten years, when all of a sudden the scholars of the University, animated by their notorious affection for sound learning and a good "row," took Oriel by storm and carried off the books in triumph to Bishop Cobham's room, where they remained in chests unread for thirty years. In 1367 the University by statute ratified and confirmed its title to

DUKE HUMPHREY'S LIBRARY IN THE BODLEIAN

the books and published regulations for their use, but the quarrel with Oriel continued till 1409, when the Cobham Library was for the first time properly furnished and opened as a place for study and reference.

The Librarian of the old Cobham Library had an advantage over Mr. Nicholson, the Bodley Librarian of to-day. Being a clerk in holy orders before the days when, in Bodley's own phrase, already quoted, we "changed" our religion, he was authorized by the University to say masses for the souls of all dead donors of books, whether by gifts *inter vivos* or by bequest.

The first great benefactor of Cobham's Library was Duke Humphrey of Gloucester, the youngest son of Henry IV., and perhaps the most "pushful" youngest son in our royal annals. Though a dissipated and unprincipled fellow, he lives in history as the "good Duke Humphrey" because he had the sense to patronize learning, collect manuscripts, and enrich universities. He began his gifts to Oxford as early, so say some authorities, as 1411, and continued his donations of manuscripts with such vivacity that the little room in St. Mary's could no longer contain its riches. Hence the resolution of the University in 1444 to build a new library over the Divinity School. This new room, which was completed in 1480, forms now the central portion of that great reading-room so affectionately remembered by thousands of still living students.

Duke Humphrey's Library, as the new room was popularly called, continued to flourish and receive valuable accessions of manuscripts and printed books belonging to Divinity, Medicine, Natural Science, and Literature until the ill-omened year 1550. Oxford has never loved Commissioners revising her statutes and reforming her schools, but the Commissioners of 1550 were worse than prigs, worse even than Erastians, they were barbarians and wreckers. They were deputed by King Edward VI., "in the spirit of the Reformation," to make an end of the Popish superstition. Under their hands the Library totally disappeared; and for a long while the tailors and shoemakers and bookbinders of Oxford were well supplied with vellum which they found useful

in their respective callings. It was a hard fate for so splendid a collection. True it is that for the most part the contents of the Library had been rescued from miserable ill-usage in the Monasteries and Chapter-Houses where they had their first habitations, but at last they had found shelter over the Divinity School of a great University. There at least they might hope to slumber. But our Reformers thought otherwise. The books and manuscripts being thus dispersed or destroyed, a prudent if unromantic Convocation exposed for sale the wooden shelves, desks, and seats of the old library, and so made a complete end of the whole concern; thus making room for Thomas Bodley.

On the 23d of February, 159⅞, Thomas Bodley sat himself down in his London house and addressed to the Vice-Chancellor of his University a certain famous letter:

Sir,—Altho' you know me not as I suppose, yet for the farthering of an offer of evident utilitie to your whole University I will not be too scrupulous in craving your assistance. I have been alwaies of a mind that if God of his goodness should make me able to do anything for the benefit of posteritie I would shew some token of affiction that I have ever more borne to the studies of good learning. I know my portion is too slender to perform for the present any answerable act to my willing disposition, but yet to notify some part of my desire in that behalf I have resolved thus to deal. Where there hath been heretofore a public library in Oxford which you know is apparent by the room itself remaining and by your statute records, I will take the charge and cost upon me to reduce it again to its former use and to make it fit and handsome with seats and shelves and desks and all that may be needful to stir up other mens benevolence to help to furnish it with books. And this I purpose to begin as soon as timber can be gotten to the intent that you may be of some speedy profit of my project. And where before as I conceive it was to be reputed but a store of books of divers benefactors because it never had any lasting allowance for augmentation of the number or supply of books decayed, whereby it came to pass that when those that were in being were either wasted or embezzled, the whole foundation came to ruin. To meet with that inconvenience, I will so provide hereafter (if God do not hinder my present design) as you shall be still assured of a standing annual rent to be disbursed every year in buying of books, or officers stipends and other pertinent occasions, with which provision and some order for the preservation of the place and the furniture of it from accustomed abuses, it may perhaps in time to come prove a notable treasure for the multitude of volumes, an excellent benefit for the use and ease of students, and a singular ornament of the University.

The letter does not stop here, but my quotation has already probably wearied most of my readers, though for my own part I am not ashamed to confess that I seldom tire of retracing with my own hand the *ipsissima verba* whereby great and truly notable gifts have been bestowed upon nations or universities or even municipalities for the advancement of learning and the spread of science. Bodley's language is somewhat involved, but through it glows the plain intention of an honest man.

Convocation, we are told, embraced the offer with wonderful alacrity, and lost no time in accepting it in good Latin.

From February, 1598, to January, 1613 (when he died), Bodley was happy with as glorious a hobby-horse as ever man rode astride upon. Though Bodley, in one of his letters, modestly calls himself a mere "smatterer," he was, as indeed he had the sense to recognize, excellently well fitted to be a collector of books, being both a good linguist and personally well acquainted with the chief cities of the Continent and with their booksellers. He was thus able to employ well-selected agents in different parts of Europe to buy books on his account, which it was his pleasure to receive, his rapture to unpack, his pride to despatch in what he calls "dry-fats"—that is, weather-tight chests—to Dr. James, the first Bodley Librarian. Despite growing and painful infirmities (stone, ague, dropsy), Bodley never even for a day dismounted his hobby, but rode it manfully to the last. Nor had he any mean taint of nature that might have grudged other men a hand in the great work. The more benefactors there were, the better pleased was Bodley. He could not, indeed—for had he not been educated at Geneva and attended the Divinity Lectures of Calvin and Beza?—direct Dr. James to say masses for the souls of such donors of money or books as should die, but he did all a poor Protestant can do to tempt generosity—he opened and kept in a very public place in the Library a great Register Book, containing the names and titles of all benefactors. Bodley was always on the look-out for gifts and bequests from his store of honorable friends; and in the case of

Sir Henry Savile he even relaxed the rule against lending books from the Library, because, as he frankly admits to Dr. James, he had hopes (which proved well founded) that Sir Henry would not forget his obligations to the Bodleian.

The Library was formally opened on the 8th of November, 1602, and then contained some two thousand volumes. Two years later its founder was knighted by King James, who on the following June directed letters patent to be issued styling the Library by the founder's name and licensing the University to hold land in mortmain for its maintenance. The most learned and by no means the most foolish of our Kings, this same James I. visited the Bodleian in May, 1605. Sir Thomas was not present. There it was that the royal pun was made that the founder's name should have been Godly and not Bodley. King James handled certain old manuscripts with the familiarity of a scholar, and is reported to have said, I doubt not with perfect sincerity, that were he not King James he would be an University man, and that were it his fate at any time to be a captive, he would wish to be shut up in the Bodleian and to be bound with its chains, consuming his days amongst its books as his fellows in captivity. Indeed, he was so carried away by the atmosphere of the place as to offer to present to the Bodleian whatever books Sir Thomas Bodley might think fit to lay hands upon in any of the Royal Libraries, and he kept this royal word so far as to confirm the gift under the Privy Seal. But there it seems to have stopped, for the Bodleian does not contain any volumes traceable to this source. The King's librarians probably obstructed any such transfer of books.

SIR THOMAS BODLEY

Authors seem at once to have recognized the importance of the Library, and to have made presentation copies of their works, and in 1605 we find Bacon sending a copy of his "Advancement of Learning" to Bodley, with a letter in which he said: "In having built an ark to save learning from deluge, deserve propriety [ownership] in any new instrument or engine whereby learning should be improved or advanced" (Macray, 35). The most remarkable letter Bodley ever wrote, now extant, is one to Bacon; but it has no reference to the Library, only to the Baconian philosophy. We do not get many glimpses of Bodley's habits of life or ways of thinking, but there is no difficulty in discerning a strenuous, determined, masterful figure, bent during his later years, perhaps tyrannously bent, on effecting his object. He was not, we learn from a correspondent, "hasty to write but when the posts do urge him, saying there need be no answer to your letters till more leisure breed him opportunity." "Words are women, deeds are men," is another saying of his, which I reprint without comment.

By an indenture dated the 20th of April, 1609, Bodley, after reciting how he had, out of his zealous affection to the advancement of learning, lately erected upon the ruins of the old decayed Library of Oxford University "a most ample, commodious, and necessary building, as well for receipt and conveyance of books as for the use and ease of students, and had already furnished the same with excellent writers on all sorts of sciences, arts, and tongues, not only selected out of his own

study and store, but also of others that were freely conferred by many other men's gifts," proceeded to grant to trustees lands and hereditaments in Berkshire and in the city of London for the purpose of forming a permanent endowment of his Library; and so they, or the proceeds of sale thereof, have remained unto this day.

Sir Thomas Bodley died on the 20th of January, 1613, his last days being soothed by a letter he received from the Vice-Chancellor of Oxford University condoling his sickness and signifying how much the Heads of Houses, etc., prayed for his recovery. A cynical friend, not much of a friend as we shall see, called John Chamberlain, was surprised to observe what pleasure this assurance gave to the dying man. "Whereby," writes Chamberlain to Sir Ralph Winwood, "I perceive how much fair words work, as well upon wise men as upon others, for indeed it did affect him very much."

Bodley was rather put out in his last illness by the refusal of a Cambridge doctor, Batter, to come to see him; the doctor saying, "Words cannot cure him, and I can do nothing else for him." There is an occasional curtness about Cambridge men that it is hard but not impossible to reconcile with good feeling.

Bodley's will gave great dissatisfaction to some of his friends, including this aforesaid John Chamberlain, and yet on reading it through it is not easy to see any cause for just complaint. Bodley's brother did not grumble, there were no children, Lady Bodley had died in 1611, and everybody who knew the testator must have known that the Library would be (as it was) the great object of his bounty. What annoyed Chamberlain seems to be that whilst he had (so he says, though I take leave to doubt it) put down Bodley for some trifle in his will, Bodley forgot to mention Chamberlain in his. There is always a good deal of human nature exhibited on these occasions. I will transcribe a bit of one of this gentleman's grumbling letters, written, one may be sure, with no view to publication, the day after Bodley's death:

> Mr. Gent came to me this morning as it were to bemoan himself of the little regard hath been had of him and others, and indeed for ought I hear there is scant anybody pleased, but for the rest it were no great matter if he had had more consideration or commiseration where there was most need. But he was so carried away with the vanity and vain-glory of his library, that he forgot all other respects and duties, almost of Conscience, Friendship, or Good-nature, and all he had was too little for that work. To say the truth I never did rely much upon his conscience, but I thought he had been more real and ingenuous. I cannot learn that he hath given anything, no, not a good word nor so much as named any old friend he had, but Mr. Gent and Thos Allen who like a couple of Almesmen must have his best and second gown, and his best and second cloak, but to cast a colour or shadow of something upon Mr. Gent, he says he forgives him all he owed him, which Mr. Gent protests is never a penny. I must intreat you to pardon me if I seem somewhat impatient on his [*i. e.* Gent's] behalf, who hath been so servile to him, and indeed such a perpetual servant, that he deserved a better reward. Neither can I deny that I have a little indignation for myself that having been acquainted with him for almost 40 years, and observed and respected him so much I should not be remembered with the value of a spoon, or a mourning garment, whereas if I had gone before him (as poor a man as I am) he should not have found himself forgotten.[1]

Bodley did no more by his will, which is dated the 2d of January, 1613, and is all in his own handwriting, than he had promised to do in his lifetime, and I feel as certain as I can feel about anything that happened nearly three hundred years ago, that Mr. Gent, of Gloucester Hall, did owe Bodley money, though, as many another member of the University of Oxford has done with his debts, he forgot all about it.

The founder of the Bodleian was buried with proper pomp and circumstance in the chapel of Merton College, on the 29th of March, 1613. Two Latin orations were delivered over his remains, one, that of Mr. John Hales, a Fellow of Merton, being of no inconsiderable length. After all was over, those who had mourning weeds or blacks retired, with the Heads of Houses, to the Refectory of Merton and had a funeral dinner bestowed upon them, "amounting to the sum of £100," as directed by the founder's will.

The great foundation of Sir Thomas Bodley has, happily for all of us, had better fortune than befell the generous gifts of the Bishops of Durham and Worcester. The Protestant layman has had the luck, not the large-minded prelates of the old religion. Even during the Civil War Bodley's books remained uninjured, at all

[1] "Winwood's Memorials," III., 429.

events by the Parliament men. "When Oxford was surrendered [24 June, 1646], the first thing General Fairfax did was to set a good guard of soldiers to preserve the Bodleian library. 'Tis said there was more hurt done by the Cavaliers [during their garrison] by way of embezzling and cutting of chains of books than there was since. He was a lover of learning, and had he not taken this special care, that noble library had been utterly destroyed, for there were ignorant senators enough who would have been contented to have it so" (see Macray, 101). Oliver Cromwell, while Lord Protector, presented to the Library twenty-two Greek MSS. he had purchased, and, what is more, when Bodley's librarian refused the Lord Protector's request to allow the Portugal Ambassador to borrow a MS., sending instead of the MS. a copy of the statutes forbidding loans, Oliver commended the prudence of the founder, and subsequently made the donation just mentioned.

A great wave of generosity towards this foundation was early noticeable. The Bodleian got hold of men's imaginations. In those days there were learned men in all walks of life, and many more that were not learned were endlessly curious. The great merchants of the city of London instructed their agents in far lands to be on the lookout for rare things, and transmit them home to find a resting-place in Bodley's buildings. All sorts of curiosities found their way there—crocodiles, whales, mummies, and black negro boys in spirits. The Ashmolean now holds most of them; the negro boy has been conveniently lost.

In 1649 the total of 2,000 printed books had risen to more than 12,000; viz., folios, 5,889; quartos, 2,067; octavos, 4,918; whilst of MSS. there were 3,001.

One of the first gifts in money came from Sir Walter Raleigh, who in 1605 gave £50, whilst among the early benefactors of books and MSS. it were a sin not to name the Earl of Pembroke, Archbishop Laud (one of the Library's best friends), Robert Burton, of the "Anatomy of Melancholy," Sir Kenelm Digby, John Selden, Lord Fairfax, Colonel Vernon, and Barlow, Bishop of Lincoln. Space would be denied me to lengthen this meager list, or even in outline to characterize the chief treasures that have so well fulfilled and transcended the hopes of the founder. I must be content to say, what all know, that no nobler library exists in the world than the Bodleian, unless it be in the Vatican at Rome. The foundation of Sir Thomas Bodley, though of no antiquity, shines with unrivaled splendor

"amidst the stars that own another birth"

in the galaxy of Oxford; for though I must not say, being myself a Cambridge man, that the Bodleian dominates Oxford, yet I may say that to many an English, American, and foreign traveler to that city, which, despite railway stations and trains and the never-ending villas of the Banbury Road, still breathes the charm of an earlier age, the Bodleian is the pulsing heart of the University. Colleges, like ancient homesteads, unless they are yours, never quite welcome you; though ready enough to receive with civility your tendered meed of admiration. You wander through their gardens and pace their quadrangles with no sense of co-ownership—not for you are their clustered memories. In the Bodleian every lettered heart feels itself at home.

Bodley drafted with his own hand the first statutes or rules to be observed in his Library. Speaking generally, they are wise rules. One mistake, indeed, he made—a great mistake, but a natural one. Let him give his own reasons: "I can see no good reason to alter my rule for excluding such books as Almanacks, Plays, and an infinite number that are daily printed of very unworthy matters—handling such books as one thinks both the Keeper and Under-Keeper should disdain to seek out, to deliver to any man. Haply some plays may be worthy the keeping—but hardly one in forty. . . . This is my opinion, wherein if I err I shall err with infinite others; and the more I think upon it, the more it doth distaste me that such kinds of books should be vouchsafed room in so noble a library."[1]

"Baggage-books" was the contemptuous expression elsewhere employed to describe this "light infantry" of literature —*Belles Lettres*, as it is now more politely designated.

One play in forty is liberal measure, but who is to say out of the forty plays which is the one worthy to be housed in

[1] See correspondence in "Reliquiæ Bodleianæ," London, 1703.

a noble library? The taste of Vice-Chancellors and Heads of Houses, of Keepers and Under-Keepers of libraries—can anybody trust it? The Bodleian is entitled by Imperial statutes to receive copies of all books published within the realm, yet it appears on the face of a Parliamentary Return made in 1818 that this "noble library" refused to find room for Ossian, the favorite poet of Goethe and Napoleon, and labeled Miss Edgeworth's "Parent's Assistant" and Miss Hannah More's "Sacred Dramas" "rubbish." The sister university, home though she be of nearly every English poet worth reading, rejected the "Siege of Corinth," though the work of a Trinity man, would not take in the "Thanksgiving Ode" of Mr. Wordsworth, of St. John's College, declined Leigh Hunt's "Story of Rimini," vetoed the "Headlong Hall" of the inimitable Peacock, and, most wonderful of all, would have nothing to say to Scott's "Antiquary," being probably disgusted to find that a book with so promising a title was only a novel.

Now all this is altered, and everything is collected in the Bodleian, including, so I am told, Christmas cards and dinner menus.

Bodley's rule has proved an expensive one, for the Library has been forced to buy at latter-day prices "baggage-books" it could have got for nothing.

Another ill-advised regulation got rid of duplicates. Thus, when the third Shakespeare Folio appeared in 1664, the Bodleian disposed of its copy of the First Folio. However, this wrong was righted in 1821, when, under the terms of Edmund Malone's bequest, the Library once again became the possessor of the edition of 1623.

Against lending books Bodley was adamant, and here his rule prevails. It is pre-eminently a wise one. The stealing of books, as well as the losing of books, from public libraries is a melancholy and ancient chapter in the histories of such institutions. Indeed, there is too much reason to believe that not a few books in the Bodleian itself were stolen to start with. But the long possession by such a foundation has doubtless purged the original offense. In the National Library in Paris is at least one precious MS. which was stolen from the Escurial. There are volumes in the British Museum on which the Bodleian looks with suspicion, and *vice versa*. But let sleeping dogs lie. Bodley would not even give the divines who were engaged upon a bigger bit of work even than his Library—the translation of the Bible into that matchless English which makes King James's Version our greatest literary possession—permission to borrow "the one or two books" they wished to see.

Bodley's Library has sheltered through three centuries many queer things besides books and strangely written manuscripts in old tongues; queerer things even than crocodiles, whales, and mummies. I mean the librarians and sub-librarians, janitors, and servants. Oddities many of them have been. Honest old Jacobites, nonjurors, primitive thinkers—as well as scandalously lazy drunkards and illiterate dogs. An old foundation can afford to have a varied experience in these matters.

One of the most original of these originals was the famous Thomas Hearne—an "honest gentleman" and a Jacobite, and one whose collections and diaries have given pleasure to thousands. He was appointed Janitor in 1701, and Sub-Librarian in 1712, but in 1716, when an Act of Parliament came into operation which imposed a fine of £500 upon any one who held any public office without taking the oath of allegiance to the Hanoverians, Hearne's office was taken away from him; but he shared with his King over the water the satisfaction of accounting himself still *de jure*, and though he lived till 1735, he never failed each half-year to enter his salary and fees as Sub-Librarian as being still unpaid. He was perhaps a little spiteful and vindictive, but none the less a fine old fellow. I will write down as specimens of his humor a prayer of his and an apology, and then leave him alone. His prayer ran as follows:

O most gracious and merciful Lord God, wonderful in thy Providence, I return all possible thanks to thee for the care thou hast always taken of me. I continually meet with most signal instances of this thy Providence, and one act yesterday, *when I unexpectedly met with three old manuscripts*, for which in a particular manner I return my thanks, beseeching thee to continue the same protection to me a poor, helpless sinner, and that for Jesus Christ his sake. (Aubrey's Letters, I., 118.)

His apology, which I do not think was actually published, though kept in draft, was after this fashion:

I, Thomas Hearne, A.M. of the University of Oxford, having ever since my matriculation followed my studies with as much application as I have been capable of, and having published several books for the honour and credit of learning, and particularly for the reputation of the foresaid University, am very sorry that by my declining to say anything but what I knew to be true in any of my writings, and especially in the last book I published entituled &c., I should incur the displeasure of any of the Heads of Houses, and as a token of my sorrow for their being offended at truth, I subscribe my name to this paper and permit them to make what use of it they please. (Macray, 188.)

Leaping a hundred and forty years, an odd tale is thus lovingly recorded of another Sub-Librarian, the Rev. A. Hackman, who died in 1874:

During all the time of his service in the Library (thirty-six years) he had used as a cushion in his plain wooden armchair a certain vellum-bound folio, which by its indented side, worn down by continual pressure, bore testimony to the use to which it had been put. No one had ever the curiosity to examine what the book might be, but when, after Hackman's departure from the Library, it was removed from its resting-place of years, some amusement was caused by finding that the chief compiler of the last printed catalogue had omitted from his catalogue the volume on which he sat, of which, too, though of no special value, there was no other copy in the Library. (Macray, 388a.)

The spectacle in the mind's eye of this devoted Sub-Librarian and sound divine sitting on the vellum-bound folio for six and thirty years, so absorbed in his work as to be oblivious of the fact that he had failed to include in his *magnum opus*, the great Catalogue, the very book he was sitting upon, tickles the midriff.

Here I must bring these prolonged but wholly insufficient observations to a very necessary conclusion. Not a word has been said of the great collection of Bibles, or of the unique copies of the Koran and the Talmud and the Arabian Nights, or of the Dante MSS., or of Bishop Tanner's books (many bought on the dispersion of Archbishop Sancroft's great library), all of which in course of removal by water from Norwich to Oxford fell into the river and remained submerged for twenty hours, nor of many other splendid benefactions of a later date.

One thing only remains, not to be said but to be sent round—I mean the Hat. Ignominious to relate, this glorious foundation stands in need of money. Shade of Sir Thomas Bodley, I invoke thy aid to loosen the purse-strings of the wealthy! The age of learned and curious Merchants, of high-spirited and learning-loving Nobles, of book-collecting Bishops, of Antiquarians, is over. The Bodleian cannot condescend to beg. It is too majestical. But I, an unauthorized stranger, have no need to be ashamed.

Especially rich is this great library in *Americana*, and America suggests multimillionaires. The rich men of the United States have been patriotically alive to the first claims of their own famous universities, and long may they so continue; but if by any happy chance any one of them should accidentally stumble across an odd million or even half a million of dollars hidden away in some casual investment he had forgotten, what better thing could he do with it than send it to this, the most famous foundation of his Old Home? It would be acknowledged by return of post in English and in Latin, and the donor's name would be inscribed, not indeed (and this is a regrettable lapse) in that famous old Register which Bodley provided should always be in a prominent place in his Library, but in the Annual Statements of Accounts now regularly issued. To be associated with the Bodleian is to share its fame and partake of the blessing it has inherited. "The liberal deviseth liberal things; and by liberal things he shall stand."

Elizabethan Lyrists

By Frank Dempster Sherman

Like to the shining host of stars are they
Whose songs, made long ago, are sweet to-day:
And like the stars, enduring as the Sun—
Shakespeare,—from whom their radiance is won.

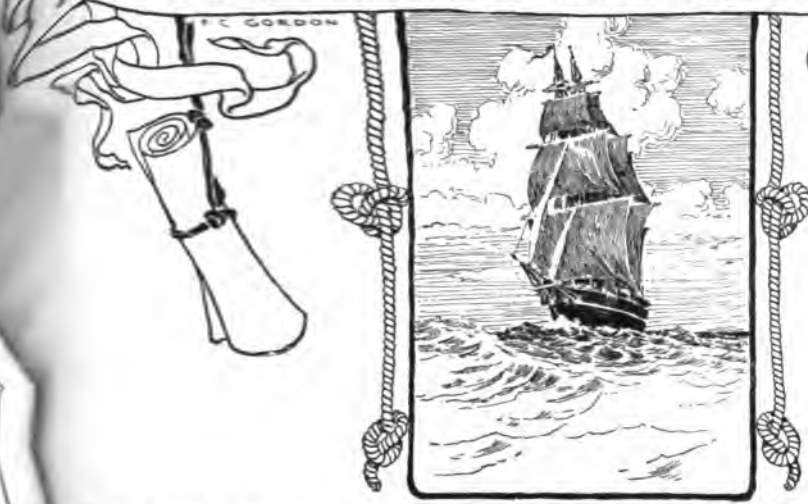
The Cry of the Locusts

By E. B. Findlay

Out from the depth of the woodlands
  Cometh a sigh on the breeze;
A whisper, whispering louder,
  Stirreth among the trees;
Then, hour by hour increasing,
  It changeth from sigh to wail:
The voice of the wingèd locust,
  Whose cry nor whose sign shall fail.

Down through the lanes and the hedgerows,
  Over the field and the plain,
At the very gates of the city,
  The cry breaketh forth again—
Pharaoh! Pharaoh! Pharaoh!
  Hearken unto our cry.
Pharaoh! Pharaoh! Pharaoh!
  Hear us before we die!

Long years, long years, have we waited
  The call, O ye sons of men,
Till He who setteth our seasons
  Had counted seven and ten;
Up from the dust have we struggled,
  Craving God's gift of our wings;
Hear ye, O kings, the message
  We bear from the King of kings!



Ye in the seats of the mighty,
  In purple and linen drest—
We are the voice of the lowly,
  The cry of the sore opprest;
This is the word that we bring ye
  From the dark beneath the sod:
Though mountains of gold should cover,
  Ye shall hear the summons of God!

Pharaoh! Pharaoh! Pharaoh!
  Hearken unto our cry.
Pharaoh! Pharaoh! Pharaoh!
  Hear us ere thou shalt die.

THE TRAGEDY OF THE LOST COMMISSION

BY JAMES BARNES

Author of "Naval Actions of 1812," "Commodore Bainbridge" "Midshipman Farragut," &c

THE following is the strange tale concerning a remarkable bit of lost evidence, around which hangs a chapter of recorded and unrecorded American history—a drama rather, smacking of romance, filled with mysterious plotting and secret international diplomacy. By what might be called a "lucky strike" it is revived from an almost forgotten past.

Only a short time ago there appeared in a catalogue of Charavay, an autograph and print seller in Paris, among scores of other notices, the following:

143 Hancock (John), célèbre homme d'État Américain, gouverneur du Massachusetts, signataire de la Déclaration d l'Indépendance—Pièce sig. comme président du congrès; Baltimore, 1 mars 1777, 1 p. in-fol. Obl. Rare.

The connection of names and dates of course would, at the outset, attract the attention of any collector of Americana, for, more than likely, they should have something to do with Franklin's sojourn in France. The price asked was much less than the principal signature alone generally brought in the autograph market, and so it was included by the present owner in a list of small purchases ordered from the catalogue.

When the paper numbered 143 w opened, it was found to be a commissio giving the rank of captain in the navy the United Colonies to one Gustav Conyngham, appointing him to the co mand of the armed vessel Surpris That was all—it was a simple bit old-fashioned printing. But—Gustav Conyngham! The Surprise! It seeme almost incredible that it should be true

Before the mind's eye there came t slight, wiry figure of a young man in long blue coat with his black hair done in queue down his back, walking the quarte deck of a tidy little vessel, at whose pe fluttered and whipped the cross-barre rattlesnake flag, while the Channel spra dashed and glittered at the plunging bow there came the billowing white smoke the old broadsides, the roar of the ca ronades, and the whir of the death-dea ing splinters; and then there came t picture of a prisoner loaded with chai in the gloom of an underground dunge and there followed the recollection of worn, crumbling tombstone (any one c see it to-day in St. Peter's churchyard Philadelphia) beneath which lies the body an old man who died in a measure from t wear and tear that follows a broken hear

Yes; there lay the long-missing paper that is mentioned by every writer who has dealt with the history of our Revolutionary navy! There was no doubt of the authenticity of the document; the well-known signatures of Hancock and Charles Thompson were substantiated by the fact that, upon comparison, the filling in of the names was found to be in the handwriting of no one less than Benjamin Franklin himself!

Here was the excuse for the sailing of the little vessel that flew the cross-barred flag! Here was the instrument that is supposed to have saved a score of lives held forfeit to the British Crown! Here was the missing evidence, for lack of which a great case at law was lost and a brave man's heart broken; for the name on the old tombstone, woven into a curious acrostic, is the same that appears on the face of the commission.

Up surges the whole of the strange story, the adventures, the excitement, the tragedy of it all!

How many have ever heard of this old-time sailorman? Few, perhaps; but the student of American naval history, he knows of him, and knows how throughout his story runs the trail of the lost commission, which for a century and a quarter has been—the Lord knows where. But without further prologue let the play come on.

Late in the fall of the year 1775 Captain Gustavus Conyngham sailed from Philadelphia in the brig Charming Peggy, bound for Holland. He was an Irishman by birth, having been born during the uneasy days of '47, in Letter Kenney in the County of Donegal. It was his intention to bring out from Holland a cargo of saltpeter and clothing, and, if possible, arms and munitions of war to aid the colonies that had already begun the struggle against the mother country. Numerous were his adventures. Once he was captured just after entering the Channel by a watchful English cruiser, but he rose against the prize crew, recaptured his little craft, and brought her safely into The Hague. However, the character of her cargo being ascertained, the British representatives made complaint to the Dutch authorities and her sailing was prevented. One of her owners, a Mr. Nesbit, of Philadelphia, was in Holland at the time, and at last it was decided to abandon the return voyage altogether, although more than once Captain Conyngham had been tempted to take advantage of the thick weather and slip out into the Channel. But the Peggy was a slow sailer and would have had little chance with the swift English cutters that were on guard outside. So Captain Conyngham, like many a Yankee shipmaster, found himself stranded in Europe, on the lookout for anything to fill up his spare moments and burning to do something for his country. He called it his country, although he had been born an alien, for his father had emigrated to America long before, and he himself had married in '73 Anne Hockley, the daughter of a Philadelphia merchant. But we must digress a little and suddenly.

It was late in the midsummer of '76 when good Dr. Franklin, Minister Plenipotentiary to the Government of France, sailed for Europe in the Reprisal, the first American ship-of-war to ride the waves of the English Channel. The news of the Declaration of Independence had preceded her, however, brought by one or two private armed vessels from Delaware and New England, those risk-all dare-devils, half pirates, half patriots, whose day is past. Not only did the Reprisal bring the great hope of the struggling colonies, for foreign aid was absolutely necessary to a continuance of war, but she carried into port three English merchantmen picked up on the way, the first Yankee prizes to be brought into the harbors of a foreign country.

A hard time did the good Doctor have of it at first, for the English Ambassador to France, Lord Stormont, was up in arms. If the prizes remained in French ports, he would quit the country; if "the Arch Traitor and Conspirator" reached Paris, he would likewise! But marvelous are the methods of French statecraft, and subtle the manners of intrigue!

The prizes did leave French ports—ordered out instanter in no doubtful terms—but they were sold with their contents "just outside" to French merchants. The messenger sent to stop the young-hearted old philosopher, with his papers in his capacious pockets, missed his way—what a dolt of a messenger!—and of course French politeness, sense of hospitality, and love of justice prevented a

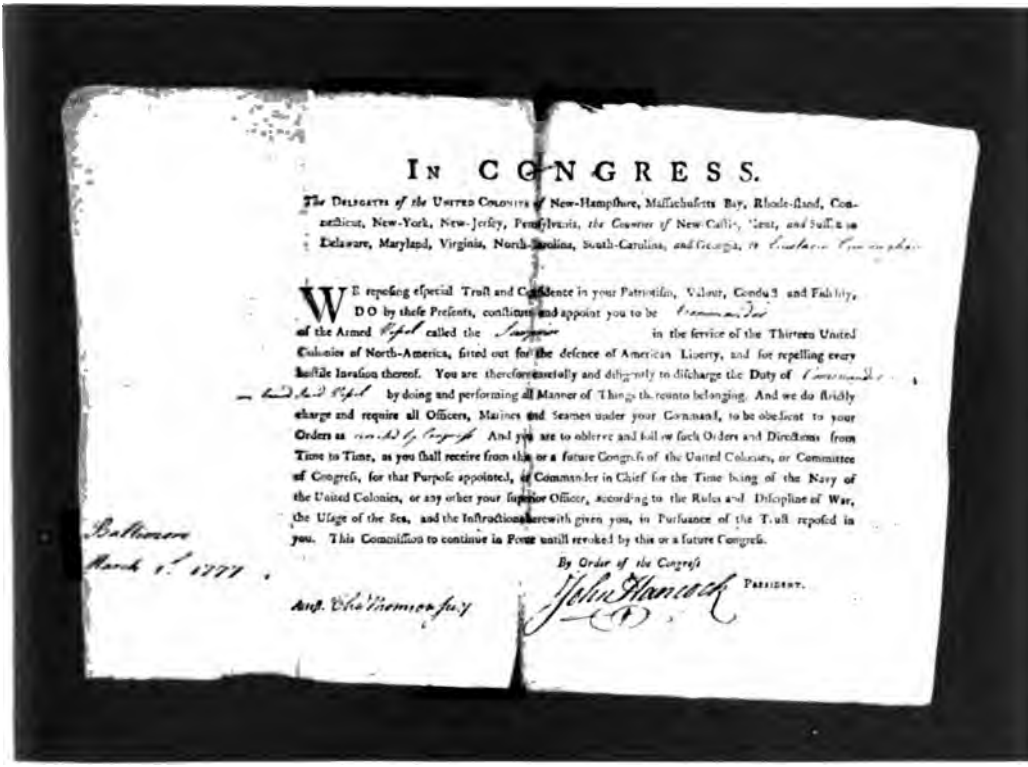
PORTRAIT OF CONYNGHAM, FROM A FRENCH PRINT PUBLISHED IN 1779

From the collection of Captain John S. Barnes.

harmless old gentleman, who could but amuse and instruct people, being asked to leave when once he had passed the city gates. Thus, in substance, wrote M. Le Comte de Vergennes, the king's Prime Minister. So Franklin stopped in Paris, and Lord Stormont swallowed his anger and wrote warning letters to his Government.

It was just at this time that Conyngham arrived at Dunkirk from The Hague, and almost immediately upon landing there he met a friend of his named Ross, from whom he learned a great deal of the state of affairs in America and of the doings at the French capital. Through Ross he also met a Mr. Hodge and his friend Allan, both of whom were well acquainted with the American Commissioners, Dr. Franklin, Arthur Lee, and Silas Deane. Not long after this Conyngham was sent for by Mr. Hodge, who requested him to repair at once to Paris, where he might learn of something much to his advantage.

Although the Captain kept a diary, in which were entered most minutely his subsequent adventures, he says very little of this journey; it was probably undertaken in strict secrecy. At all events, he must have been informed of the mysterious arrangements then existing between the French Ministry and the American Commissioners, and there is no doubt that he was admitted to the inner circle of the intriguers.



It was a remarkable condition of affairs indeed that Conyngham found. The French Government, under the direction of that wonderful leader of old-fashioned diplomacy, M. le Comte de Vergennes, was playing fast and loose with the representative of the English Court. King Louis was not ready for war, but in the success of the revolted colonies France saw the means to strike a heavy blow at her natural enemy across the Channel, and at the same time to safeguard her possessions beyond the seas. She had not forgotten the loss of Canada—she feared for Louisiana. The old gentleman who played chess at his little house in Passy played deep in another game. Weighty sentences were spoken over extended snuff-boxes. Messages and decisions meaning almost life or death to the new-born nation were bandied lightly over wine-glass rims, and of these days and dealings Franklin wrote afterward "Of course no minutes could be kept."

So the play went on. France could not openly aid the enemy of a friendly power, but there was nothing to prevent a commercial house from giving credit to private individuals who assumed the risk of sending out cargoes liable to capture on the high seas. So there was formed the sagacious house of Roderigo, Hortalez & Co.: General Manager, Beaumarchais; sleeping partner, M. le Comte de Vergennes; principal stockholders, the Court, King Louis and Queen Marie Antoinette, *et al.*; there followed the historic loan of 200,000 livres, the shipment of thirty-five thousand stand of arms and eighty cannon. There was a little money yet left over. It was decided that it should not remain idle. Conyngham was asked to come to Dr. Franklin's house, and there, as he states in his sworn testimony, Dr. Franklin gave him, with his own hands, a commission as a captain in the navy of the United Colonies, and immediately he returned to Dunkirk.

Now let us see what the Father of American Naval History says in this connection.

"In the spring of 1777," writes Cooper, "an agent was sent to Dover by the American Commission, where he purchased a fine fast-sailing English cutter and had her carried across to Dunkirk. Here she was privately equipped as a cruiser and named the Surprise. To the command of this vessel Captain Gustavus Conyngham was appointed by filling up a blank commission from John Hancock, the President of Congress. This commission bore the date of March 1, 1777, and it would seem as fully entitled Mr. Conyngham to the rank of captain in the navy as any that was ever issued by the same authority."

Armed with this necessary document, it did not take Captain Conyngham long to recruit his crew. In the main they were American seamen held in French ports by the embargo, and, like their leader, they were only too eager to cruise against the commerce of England. But think of it! One little vessel starting out alone into King George's private sailing-ground! Just about this time the vessel that had brought Franklin to Europe, under com-

IN CONGRESS.

The Delegates of the United Colonies of New-Hampshire, Massachusetts Bay, Rhode-Island, Connecticut, New-York, New-Jersey, Pennsylvania, the Counties of New-Castle, Kent, and Sussex on Delaware, Maryland, Virginia, North-Carolina, South-Carolina, and Georgia, to [illegible]

WE reposing especial Trust and Confidence in your Patriotism, Valour, Conduct and Fidelity, DO by these Presents, constitute and appoint you to be [illegible] of the Armed Vessel called the [illegible] in the service of the Thirteen United Colonies of North-America, fitted out for the defence of American Liberty, and for repelling every hostile Invasion thereof. You are therefore carefully and diligently to discharge the Duty of [illegible] by doing and performing all Manner of Things thereunto belonging. And we do strictly charge and require all Officers, Marines and Seamen under your Command, to be obedient to your Orders as [illegible] And you are to observe and follow such Orders and Directions from Time to Time, as you shall receive from this or a future Congress of the United Colonies, or Committee of Congress, for that Purpose appointed, or Commander in Chief for the Time being of the Navy of the United Colonies, or any other your superior Officer, according to the Rules and Discipline of War, the Usage of the Sea, and the Instructions herewith given you, in Pursuance of the Trust reposed in you. This Commission to continue in Force until revoked by this or a future Congress.

By Order of the Congress

John Hancock PRESIDENT.

Baltimore March 1st 1777

Attest. Chas Thomson Secy

THE LOST COMMISSION

From the original, owned by Captain John S. Barnes

mand of Captain Wickes, the Reprisal, to which the Lexington, of fourteen guns, and the Dolphin, of eighteen guns, had been joined, was preparing to start on a short cruise into the Irish Channel. But they were, so to speak, men-of-war and were to sail in company. Here was a craft of something under a hundred tons about to sail alone.

Two months to a day after the date of the commission that he held, Conyngham put boldly out into the chops of the English Channel.

In the cabin locker was the Rattlesnake flag—thirteen alternate red and white stripes, with the snake across them, and beneath the warning legend, "Don't Tread on Me." He had it made for him by a sailmaker on his vessel, and he was eager to see it at his masthead.

Within six hours of port he had two exceedingly narrow escapes from capture, but he managed to elude his pursuers, and on the morning of the 4th (Cooper and most naval historians have the date wrong, giving it as the 7th), when but a few leagues from the coast of Holland, he fell in with a small vessel flying the English flag. It had been his intention to hold up, if possible, and capture or turn back one of the transports then engaged in carrying Hessian troops to America, but, failing in this, it was his hope to run across one of the King's cutters, or small packets in the royal service.

On the small vessel came, all unsuspecting, and by clever maneuvering Conyngham laid the Surprise alongside and boarded her, without a warning shout or shot. The captain of the English vessel and his passengers were at breakfast in the cabin when the first mate suddenly called down from the deck that a strange craft had run afoul of them and made fast with a grappling-iron. Before any one could stir, Captain Conyngham himself walked down to the cabin and informed the master of his prize that he was a prisoner. Upon finding that his prize was the Prince of Orange, the Harwich packet, carrying the mails for the north of Europe, Captain Conyngham

considered it best to make for port with all possible haste, so, placing a prize crew on board the packet, he headed both vessels back for Dunkirk.

The next day he picked up another little craft, a brig named the Joseph, and, with both prizes under his lee, he sailed into the harbor and came to anchor.

The British Ambassador was up in arms again. "Hortalez & Co." must have been greatly put out by the earnestness of their agent at sea. Duplicity of the deepest dye must be resorted to to save the day! So the Comte de Vergennes wrote to Lord Stormont expressing the greatest indignation and regret. Forthwith Conyngham and his crew were taken from the Surprise, and found themselves hurried to the gates of a French prison. The prizes were turned over to the English Government and the cutter was confiscated. "On this occasion," writes Cooper, "the commission of Captain Conyngham was taken from him and sent to Versailles, and it seems never to have been returned."

Why was the commission sent to Versailles? Certainly it appears, at first glance, that if Conyngham wished to prove his right to make captures, he should have shown it to the representative of the English Government. He either knew better than that, or was acting under very good advice, for he was not yet in the hands of the British Government, although detained at the expressed wish of Lord Stormont. There were powerful friends of America at the French Court, and, to tell the truth, the Court itself was rather deeply involved in the game of pulling the wool over the English Minister's eyes. True enough, if the Comte de Vergennes could have kept up appearances by the sacrifice of Conyngham and his crew as mere privateersmen, he would not have cared a snap of his finger, for France, at all times, was his only thought; but to give up an officer of the United Colonies Navy, and holding a commission as such, was more than he dared to do, considering the fact that he was deep in the game with Beaumarchais and on friendly terms with good Dr. Franklin, who was on friendly terms with everybody.

THE TAKING OF THE HARWICH PACKET

From a Dutch print of 1777, showing the rattlesnake flag. Owned by Captain John S. Barnes.

Perhaps he did not know that Franklin had possession of those blank commissions. Perhaps he did not think that the good Doctor was so well prepared. There is sufficient proof, however, to show that he endeavored his best to dodge receiving the commission when it was sent to Versailles, and this may have been in order to have a salve for his diplomatic conscience, for he was all the time promising Lord Stormont that the prisoners should be turned over to the British representatives, and probably assuring his Lordship also that he did not care whether they were hanged, drawn, or quartered. But the old adage of "the power behind the throne" is a good one, and in this case the power was no less than the French Queen, with whom Franklin was on the friendliest terms—if Dame Rumor of the time speaks correctly. At all events, the commission reached the fair hands of Marie Antoinette, and through her reached those of King Louis, and through him, of course, it was easy to get at the Prime Minister.

Print taken from the original displayed in an English coffee-house in Dunkirk, 1777. Owned by Captain John S. Barnes.

I might say all this "supposedly," for Franklin was too much of a gallant to drag in a lady's name directly, and in all his correspondence afterwards he has clearly avoided bringing the question to a head; but in a letter written at this very time to the British Government by one of its spies, Dr. Bancroft, F.R.G.S.—a man who took money from both parties, for he was in the American employ also—we find these words: "Lord Stormont has the ear of Comte de Vergennes, but Franklin has the Queen on his side, and she will do what he says."

At all events, just before the vessels arrived that were to take Conyngham and his companions to England to stand trial (and the noose was swinging for him), orders were brought post haste from Paris, and he and his whole crew were released and found themselves again free men.

Was the doughty Captain discouraged? Not a bit of it! There is a little anecdote told of him during his confinement in the prison at Dunkirk. His confinement there was not made a hardship; he was allowed the liberty of the jail yard and inclosure, and one day he was there taking exercise by bounding a rubber ball back and forth against the high brick sides of the building, when a red-faced man approached him, and without ceremony spoke.

"I am Captain Cuthbertson, of his Majesty's sloop-of-war Alert," he said; "your name is Conyngham."

The Captain stopped in his game, and acknowledged that to be the fact, and added that he was the Captain of the late American cruiser, the Surprise.

"Which has been turned over to his Majesty's Government with the other vessels that you piratically took off the coast of Holland," replied the officer.

"Indeed!" answered Conyngham; "that must be gratifying to his Majesty."

And then he went on and invited the Captain to take off his coat and have a game with him, suggesting that they play for a wager of their shoebuckles or their wigs.

"You've played for a larger stake than that and lost," said the Englishman in reply. "How can you, knowing that your life is in jeopardy, indulge in such pastimes?"

"If my life was in jeopardy, I am sure it would be so in a good cause. I ask for no favors, except for a little more elbow-room, for you're standing just where I've been playing."

The officer controlled his anger with difficulty, and then all at once blurted out the object of his visit. He had come to suggest that it might be possible for Conyngham to receive a pardon if he would swear allegiance to the King, and he even hinted that a billet might be found for him in the royal navy.

Conyngham's reply showed well his spirit.

"You can tell those who sent you," he said, "that his Majesty might offer me a position of an Admiral of the blue, and I would tell him that I would rather spend my days in the hold of a prison-ship than accept it. As you will not play with me, I shall have to ask you to stand aside again. Some day we may meet when the game will be for larger stakes and there will be harder missiles flying."

With that he wished his guest good-morning.

Now, when he found himself free again, his first thought was to get once more into active service. There was a fine vessel of a larger tonnage than the Surprise lying at Dunkirk, and for sale. The very first thing that Conyngham did was to seek out Hodge and Allan. The former made a flying trip to Paris, had an interview with Franklin and Félix Grand, the banker for Hortalez & Co., and posted back almost immediately t Dunkirk.

Let us turn to a letter published in th London "Times" of about this date. I is written by one James Clements, an sent from Dunkirk. "I saw Conynghar yesterday," it runs. "He had engaged crew of desperate characters to man vessel of 130 tons. She has now Frenc men on board to deceive our Ministe here. A fine, fast-sailing vessel, hand somely painted blue and yellow, is no at Dunkirk, having powder, small arms and ammunition put on board of her Conyngham proved the cannon himself and told the bystanders he would play the d—l with the British trade at Havre It is supposed when the vessel is ready the Frenchmen will yield command t Conyngham and his crew. The vessel i to mount twenty carriage guns and t have a complement of sixty men. She i the fastest sailer now known—no vesse can catch her once out on the ocean. I send you timely notice, that you may be enabled to take active measures to stay this daring character, who fears not man or government, but sets all at defiance. He had the impudence to say, if he wanted provisions or repairs he would put into an Irish harbor and obtain them. It is vain here to say Conyngham is a pirate. They will tell you he is one brave American; he is a 'bold Boston.' You cannot be too soon on the alert to stop the cruise of this daring pirate."

In Cooper's history we find the following in reference to Conyngham's release:

"The Commissioners had the capture of some of the transports with Hessian troops on board in view, and they were no sooner notified of the seizure of the Surprise than Mr. Hodge, an agent who was of great service to the cause, was directed to procure another cutter. One was accordingly purchased at Dunkirk, and was fitted, with all despatch, for a cruiser. Means were found to liberate Captain Conyngham and his people, and this second vessel, which was called the Revenge, sailed from Dunkirk on the 18th of July, or about the time that Captain Wickes returned from his cruise with the other vessels. A new commission had been obtained for Captain Conyngham, previously to putting to sea, which bore date May 2d, 1777. As this second

commission was dated anterior to the seizure of the old one, there is no question that it was also one of those in blank, which had been confided to the Commissioners to fill at their discretion."

It was Mr. Carmichael, Secretary to the Commissioners at Paris, who gave Conyngham his final orders for the Revenge on the morning of July 15, in Dunkirk; and in Conyngham's narrative the gallant Captain states that he also gave him "some verbal instructions which were impossible to write." He was, probably, again warned to put to sea at once.

There is no doubt that at this time there was not a little friction among the American Commissioners themselves—Franklin and Lee and Silas Deane. Owing to the fact that so much of the correspondence had to be in ambiguous terms and so many of the meetings and arrangements with the French Ministry entirely *sub rosa*, the positions that they consequently occupied in relation to one another varied at different times, but Conyngham looked to the fountain head. His first orders had been received from Dr. Franklin; and now let us look at the sailing orders transmitted by Mr. Carmichael on behalf of the Commissioners. Surely they must cause a smile, and there is a gleam in them of Franklin's peculiar humor. (The original sailing orders are in possession of the author.) They are dated July 15, 1777.

To Capt. Cunningham.

As with much difficulty the Commissioners of the United States of North America now at Paris, have obtained liberty for you to sail from Dunkerque, and as it has been on express condition that you should not cruise against the Commerce of England, I beg and instruct you in the name and by the orders of the Commissioners, that you do nothing which may involve your security or occasion umbrage to the Ministry of France—notwithstanding which, if necessity obliges you to obtain provisions of which your stock is not abundant, on account of the abrupt manner in which you are obliged to leave the Port, or if attacked first by our enemies, the circumstances of the case will extenuate and plead in favor of your conduct, either in making prizes for your own preservation, or in making reprisal for damages sustained. Nothing of this sort happening, you are to proceed directly to America, delivering as soon as possible the despatches intrusted to your care, and taking your further orders from your employers there. Wishing you success and prosperity, I am, &c.

WM. CARMICHAEL.

Rare French print showing Britannia upbraiding Neptune, and pointing out Conyngham with the flag and crowing cock, while the English fleet are in full flight, Victory deserting them. From the collection of Captain John S. Barnes.

The departure of the Revenge was no doubt a clandestine one, Conyngham, with part of his crew and armament, being placed on board when free of the harbor. What was to be expected from the humorous sailing orders printed above any one might guess. What the verbal orders were it is easy to surmise. Captain Gus-

tavus Conyngham began to cruise from the moment he had a good offing.

Good fortune attended the Revenge from the very moment she sighted the coast of England, for on her second day out she captured a large ship, and the day following a brig. They were despatched, as were all the subsequent prizes, to Spanish ports, where Hortalez & Co. had established agencies, and there they were disposed of to French and Spanish merchants and the money forwarded to the Commissioners and their agents. During this remarkable cruise Conyngham kept at sea for two months, and then made a visit to Spain and returned once more to the cruising-ground. Over forty sail of all kinds were taken as prizes, and but few of them were recaptured or destroyed.

The Revenge ran in and out of Irish and, on one or two occasions, English ports with impunity. In the harbors of his own birth-country Conyngham paid for what he took in the way of supplies with orders on Lazzonere & Co., Spanish agents of Hortalez et Cie., representing himself as an honest merchantman. He crossed the Bay of Biscay a half-dozen times, and from Corunna and other places made reports to the Commissioners in Paris. It was while he was engaged in this exciting occupation that King George III. is reported to have said to Lord North that "if they could catch that pirate Conyngham, he would rejoice to go to his hanging."

Of course, with the first news that Conyngham was taking prizes along the coast there arose a storm of indignation in England, and troublesome clouds began to gather at Paris and Versailles. The long-suffering English Ambassador actually began to pack up his things and to threaten open war. So a scapegoat must be found, and poor Hodge, the agent at Dunkirk, was the man at whom the finger of the Comte de Vergennes was pointed, for he was the one who had appeared first on Conyngham's bond. All of the circumstances were aggravated by the fact that during the first week of Conyngham's departure Captain Wickes and his three vessels, having narrowly escaped capture, returned to French ports after having taken a few prizes in the Irish Channel. They, of course, having been built and outfitted in America, were in a different class, so far as the French Government was concerned, from the Revenge, but still their coming further incensed British popular feeling and hurried Lord Stormont in his preparations for departure. So they clapped Mr. Hodge into the Bastile, and the Comte de Vergennes, in writing to Mr. F. Grand, the Commissioners' banker in Paris, under date of August 21, '77, states that Hodge gave bonds and engagements that there should be no cruising on the French coast, and says, referring to Mr. Hodge, "It is a very serious matter to lie to a king, which he hath done when he declared and gave bonds that the vessel leaving Dunkirk should not make a cruise."

Lord Stormont's threats, gathered from his correspondence, were as follows: He declared that if a summary example were not made of the American agents, orders would be given to the British fleet to intercept and seize the French Newfoundland fleet just then expected to arrive. He also on August 10 declared to the French Court "that any French ships bound to the American ports with arms or ammunition shall be deemed lawful prizes by the Court of Great Britain if taken." He also declares it "to be the intention of the English Court to treat all American privateersmen as pirates."

A letter in the "Times," dated from Paris, at this juncture reads as follows: "England threatens France with her navy; France menaces her with an army; they are both tinder—the least spark will kindle a flame. War is suspended by a threat. It is the power of any Captain in the navy to begin it on the morrow. . . . The commission of Congress must be considered valid on the part of France to make a capture a lawful prize . . . which was shown by the conduct of the Court in regard to Conyngham, who was placed within the walls of a prison while he enjoyed in secret all the advantages of a free man. Cover is now no longer necessary. France has an army in readiness; she has fleets; she is ready to strike a blow. May England be prepared. Stormont was not wanting in attaining intelligence. He had good spies, but thought the Ministry were in his favor and the Queen only in favor of Franklin; hence he became a dupe to their arts."

Let us see what Franklin thought of the whole proceeding. He writes from Paris on July 27, 1777, thus:

"The King has complied with the request of Lord Stormont and committed Mr. Hodge to the Bastile. Mr. Hodge will not experience any inconvenience except a temporary deprivation of liberty."

So Conyngham was helping to accomplish the very thing he most wished to see—war between France and England.

In a letter from Silas Deane to Robert Morris, referring to the doings of Yankee cruisers in English waters, Mr. Deane observes that "they effectually alarmed England, prevented the great fair at Chester, occasioned insurance to rise, and even deterred the English merchants from shipping goods in French bottoms, at any rate, so that in a few weeks forty sail of French ships were loading in the Thames on freight, an instance never before known." Further on the Commissioner adds: "In a word, Cunningham [Conyngham], by his first and second bold exhibitions, is become the terror of all the eastern coast of England and Scotland, and is more dreaded than Thurot was in the late war."

Cooper says in this same reference: "Insurance in some instances rose as high as twenty-five per cent., and it is even affirmed that there was a short period when ten per cent. was asked between Dover and Calais, a short distance of only seven leagues."

We have left Mr. Hodge in the Bastile. Upon the safe arrival of the Newfoundland fleet he was released, and that is all there is to say of that.

Captain Conyngham at last gave up cruising in British waters and took the Revenge into the harbor of Ferrol. Unfortunately, he was now in hot water with the Spanish Court, for he had sent in a vessel that claimed to be Spanish, and it was taken, at the written request of his crew, into Teneriffe, with order to be sent to Martinique. There was much correspondence and protest between the Count d'Aranda, Spanish Minister at Paris, with the Comte de Vergennes and with Franklin.

Touching at the West Indies, where he stayed for a short time, Conyngham sailed at last for home, and arrived in Philadelphia in February, 1779, where the Revenge was turned over to Congressional authorities and sold at public sale by the National Government.

Odd to remark, Conyngham, a few weeks later, was on the quarter-deck of the Revenge again, for the vessel was purchased by his cousin's firm, Conyngham, Nesbit & Co., and he sailed in her as part owner and as privateersman from the Capes of the Delaware, under his old commission of March 2. But now he begins to meet with misfortune. After referring to his detention in Philadelphia and his sailing under his old commission, he writes thus:

I went round to New York—laid in the roads, two privateers who followed me kept in sight—I made every effort to get them to come down, but to no effect—then made chase after them, but to no purpose—at length, as the d——l would have it, led me into the very teeth of the Gallatea (Captain Jordan). I made effort to escape, but in vain, her teeth were too many. I was taken—my crew were sent on board the prison ship in New York—I was lodged in the condemned dungeon for fourteen days. I lived on a four-penny loaf of bread, with bad water. I was then examined, taken out of the dungeon, put in a room called Congress Hall, with other prisoners. Again I was removed—had iron shackles weight of 55 lbs. put on me, placed in irons on the deck of the packet; then carried to Pendennis castle, a large figure 4 of iron placed on each hand, then sent to Plymouth, lodged in the guard-room outside of the prison—then taken before the judges, examined and committed to Winchester under the high treason statute, attempted afterwards to escape, but was retaken; again attempted it and was successful, with a constitution shattered by ill-treatment, but with a spirit unbroken. I determined to be revenged or die a glorious death on behalf of my adopted country.

G. CONYNGHAM.

The date of his capture was the 27th of April, 1779, and he arrived in England the first week of July. His life in prison seems to have been a succession of hardships and attempts to escape, of all of which he made record in a most remarkable diary. Twice he broke loose. Once he deliberately walked out in the disguise of a visiting doctor, and at last he succeeded in digging out, with fifty-three American prisoners, on the 3d of November, after six months' imprisonment.

He succeeded in reaching London, where he found friends, and there, in disguise, he walked the streets and read with amusement of the attempts made to recapture him and his companions. He

had the satisfaction of seeing a picture of himself in a print-shop window, labeled "The notorious pirate, Conyngham," and representing him to be an enormous creature almost seven feet in height, of fierce aspect, with a belt full of pistols, and an enormous hanger almost six feet in length trailing at his side.

The party that had escaped with him had broken up into small detachments, and before he had found opportunity to get away from London and cross the Channel several of his companions had worked their way to Portsmouth and succeeded in reaching the shores of France in an open boat; but it must not be supposed that during the time of his imprisonment his good friend, Dr. Franklin, had neglected him—this we can see by looking once more at Franklin's correspondence. There is one letter that is of interest in this connection:

"I see by your newspapers," wrote Franklin from Paris to Hartley at London (Hartley, M.P., secret friend of America) during the summer of 1779, "that Capt. Cunningham, one of our cruisers, is at length taken and carried prisoner into England, where it is proposed to try him as a pirate, on the pretence that he had no commission. As I am well acquainted with the fact, I can assure you that he really had a Congress commission. And I cannot believe that mere resentment, occasioned by his uncommon success, will attempt to sacrifice a brave man, who has always behaved as a generous enemy—witness his treatment of his prisoners taken in the Harwich pacquet, and all afterwards that fell into his hands. I know I shall not offend you recommending him warmly to your protection."

Mr. Jonathan Nesbit, of the firm that owned the Revenge at the time of her capture, was in L'Orient in September of '79. Under the date of 22d of that month he wrote to Benjamin Franklin a letter in which he informs the American Minister of the capture of Conyngham, supposing that the news was unknown to him. In it he relates that Conyngham had been sent to England to be tried for piracy, and goes on to say: "They pretend to say that he took the Harwich packet without having any commission, which your Excellency must know to be false, as I believe that you were in Paris at the time that his commission and orders were delivere him. The commission under which I acted as Captain of the Revenge is date I apprehend, after the taking of the Ha wich packet. It is on this circumstanc no doubt, that the charge of piracy founded. His first commission was take from him in Dunkirk after he was put gaol, and sent up to Paris, and I think w lodged in the hands of Mons. le Com de Vergennes. I have to request th your Excellency will do everything in yo power to prevent this poor fellow fro suffering." Then he goes on to recapit late the value of Conyngham's service of which, as we know, the good Doct was well informed.

To this letter Franklin replied fro Passy, under the date of September 29:

TO MR. NESBIT

Passy, Sept. 29, 1779.

Sir,—Capt. Conyngham has not bee neglected. As soon as I heard of his arriv in England, I wrote to a friend to furnish hi with what money he might want, and to assu him that he had never acted without a cor mission. I have been made to understand i answer that there is no intention to prosecu him, and that he was accordingly remove from Pendennis Castle and put among th common prisoners at Plymouth, to take h turn for exchange. The Congress, hearing the threats to sacrifice him put 3 office in close confinement to abide his fate, an acquainted Sir George Collier with the determination, who probably wrote to th British Ministers. I thank you for informin me what became of his first commission. suppose I can easily recover it, to produce o occasion. Probably the date of that take with him, being posterior to his capture of th pacquet, made the enemy think they had a advantage against him.

Nothing was heard from Conyngha except the fact that he was alive, unt Franklin received the following letter:

Amsterdam, Nov. 18th, 1779.

Dear Sir,—I have the pleasure to infor you that on the 3rd instant, with about 50 o our unfortunate countrymen, broke out o Mill prison. I brought 3 officers with m I came by the way of London, it being th safest. At London we meet with our goo friend Mr. Digges, who did everything in h power to serve one and all his countryme that chance to fall in his way. Happy we t have such a man among that set of tryan they have in that country. The treatment have received is unparalleled. Irons, du geons, hunger, the hangman's cart I hav experienced. I shall set off from here th 19th from Dunkirk. There I shall be glad t hear from you. I shall always be ready t

serve my country, and happy should I be to be able to come alongside some of those petty tryants. I find something of the effects of my confinement. In a short time will be able to retaliate. I shall at this time go out with Capt. Jones or in the squadron, could I have heard from you. I should be glad to go for the Continent if a good opportunity served. In this I shall take your advice, and act accordingly. The cash Mr. Digges supplied me with, and some necessaries I got at Plymouth; the friend we have at Plymouth is obliged to act with the greatest caution. Mr. Redmond Conyngham, in Ireland, has ordered me some little supply through the hands of David Hartley of London, a mortel enemy of America by all accounts. From your most obet. and very humble servt,

G. CONYNGHAM.

Of course at this time John Paul Jones was the hero of the hour in Europe; a little less than two months before, he had captured the Serapis, which was the culmination of his career of successful cruising on the coasts of Great Britain; but owing to the trouble with the Dutch Government, Commodore Jones was forced to put to sea on the 27th of December from the Texel, and with him sailed as an officer Captain Conyngham. He went round to L'Orient and thence to Corunna, where he joined the Experiment and sailed for America.

Unfortunately for poor Conyngham, however, the Experiment was captured by the British Admiral Edwards, and Conyngham found himself again a prisoner. He was sent to Plymouth and then to Mill prison. Again he suffered untold hardships until the day of his release.

That Captain Jones had considered him a regular appointed officer of the United States Navy is proved by the fact that he had summoned him while on board the Alliance as a member of a court martial.

As soon as Conyngham was free again he found himself in a peculiar position. For some reason (principally from lack of money), the Government deferred the settlement of claims to a future date, and fought with all possible vigor many just payments that should have been made from the public treasury. Again and again was Conyngham put off, though he petitioned yearly, as he himself states, from '79 to the year '98. Then, in '93, the case came under judgment; but many of the witnesses were dead, Dr. Franklin among them. Some of the Commissioner's agents turned against him, and his suit for restitution of funds and back payments was held not proven. He claimed but two-twentieths of the value of the prizes taken, that proportion being due to all regularly commissioned officers of the navy under an Act of Congress.

During the quasi-war with France Conyngham was in command of the armed brig Maria, of which he was part owner, and made several cruises, which, however, did not bring him in much money in return. In the War of 1812, though advanced in age and broken down in health, he endeavored once more to go to sea, but was forced to give it up.

During all this time he endeavored to keep alive his fight for recognition. Year after year he sent in petitions to Congress and tried to get a review of his claims. He caused many inquiries to be made for the lost commission, the possession of which would have determined at once his position in earlier days.

In a review of his case by Benjamin Walker for the Government, much stress was laid upon the fact that he could produce no proof in substantiation of his assertions. The commission had not been recorded at the time, and even the one that the British had taken from him could not be produced in evidence.

Every man has his enemies, and some were found who declared that the first commission had never existed and that Conyngham had been a freebooter, who had turned everything he could get to his credit. In vain he presented his sworn accounts, receipts, and bills from the Spanish agents, but in answer he was told that they were acting for a private corporation. Bitterer and bitterer he grew, until by some he was considered to have his mind unhinged on the subject. Twice he himself searched for the missing commission in Paris, but no trace of it could be found, and at last he died in Philadelphia, on the 27th day of November, 1819.

And now out of the mysterious past comes to light the very paper for which he sought. It might be some satisfaction if the half-undecipherable inscription on the crumbling tombstone in St. Peter's churchyard could be renewed and if there could be added to the curious old acrostic the words "Captain in the Navy of the United Colonies by virtue of"—by virtue of what we know now.

One Result

By Grace Denio Litchfield

BEAUTIFUL Mrs. Haviland was dashing through the Park in her victoria, her six-year-old son by her side. The autumn breeze was blowing freshly, and the two exquisite rose-tinged faces, one a smaller replica of the other, made a rare picture. Almost every one turned to look at them as they passed. Those who knew the lady bowed and smiled, or bowed and did not smile, while she had only the same slight but captivating glance of recognition for each. A gentleman on a fine bay joined her before she had gone far, and made the tour beside her carriage. After that still more of the passers turned to look, and fewer smiled as they bowed. But the radiance of her look never faltered, and if the rose of her cheek was somewhat deeper, so was the boy's, and the afternoon was grown cold.

It was five o'clock when the victoria left the Park, and, rolling down the avenue, turned into the broad, substantially built side street near the corner of which was the lady's home. The gentleman on the bay accompanied her as far as the street corner, and there took leave. A little girl, watching with straining eyes from an upstairs window, saw him as he lifted his hat from his handsome blond head, and wondered vaguely who he was. Any one of Mrs. Haviland's many servants could have told her. But Ruth never talked with the servants. She rarely talked even with the nurse or with Miss Murray, her governess, who, however, though a miracle of gentleness and well-preserved if characterless prettiness, was not precisely a confidence-eliciting person. She did not talk much even with her lttle brother, though she played with him by the hour on rainy afternoons, keeping him absorbed from first to last when no one else could manage the self-willed little fellow for ten minutes at a time.

She went now to the head of the stairs, partly to meet Harry, but more to catch a glimpse of her idolized mother. Harry did not come up, however. Mrs. Haviland's maid was sent for downstairs to remove her wraps, and Ruth, peeping over the banisters, had a gratifying vision of her mother reflected in the long hall-glass, as the lady stood before it while the maid deftly pinned back a lock escaped from the loose coil of her hair. Do mirrors realize when they are blessed? Not to many is it given to reflect so complete and satisfying a beauty as was this lady's. But all too soon she turned away, and, calling to Harry, took him in with her to the tea-table to stand at her elbow like a bewitching little page while she poured tea. She often took him in with her so—that is, if people were coming.

Ruth went slowly away from her post, therefore, knowing that Harry would not come up as long as the good time lasted. On her way to the school-room she passed her father coming down from his study. He did not see her in the semi-darkness—nobody ever seemed to see Ruth unless there were a bright light—and she slipped silently by, not caring in the least that he had not seen her, nor that if he had he might not have noticed her save by a grave nod. It was Harry whom he always saw and always stopped to speak to. Why should he or any one speak to her? For there was nothing about her even remotely like her mother. She was a singularly plain child, upon whom no amount of tasteful dressing conferred any saving distinction, and the consciousness of her unattractiveness lay like an added blight upon her personality.

It was past the children's supper hour when Harry came dancing into the nursery, where he and Ruth took their meals. Mrs. Haviland, too, would soon be coming upstairs to dress for dinner. Ruth was meditating slipping out into the hall for another sight of her as she swept radiantly down the passage to her room, when—wonder of wonders!—the nursery door opened and she came in. It was only to give the nurse some direction about Harry's toilette for the next day's drive, but Ruth's heart beat with joy at the sight of her.

Harry was looking particularly charming just then. His curls were tumbled all

over his forehead, and his face was flushed with the heat of the room till it looked like a ripe peach. As he ran up to his mother to snatch at a charm hanging from the glittering chain about her neck, she actually stooped and kissed him. Ruth held her breath, marveling at Harry's stolidity. She knew well that at the bottom of his selfish, hard little heart Harry cared less for his mother than for the least precious of his countless toys; but the surprise of it hurt the little girl like a fresh wound at each manifestation of his indifference. What was their beautiful mother for, if not to be worshiped by all with the intense, self-effacing adoration which in Ruth's soul was love's only form?

Late that evening the nurse called her from her bed to look at Mrs. Haviland as she passed through the corridor, arrayed for a ball in all her diamonds, looking like a dream of light. And when, attracted by the little group at the bedroom door, Mrs. Haviland glanced toward it, smiling the same lovely impersonal smile that she had bestowed on her acquaintances in the afternoon's drive, Ruth's heart beat even faster than before, and she crept back to bed in a silent rapture that kept her wide awake for some time. It was such wonderful moments as these that had counted for the chief pleasures in the child's ten short years of life.

The autumn passed, and still Mrs. Haviland drove in the Park in her open victoria, while the handsome blond gentleman reined in his bay by its side; and fewer and fewer people smiled as they bowed. Then came an afternoon in early December, when the sun was a glory and the earth seemed a heaven, and Mrs. Haviland went for her drive somewhat earlier than her wont. She went alone this time. Ruth, just returned from a demure little walk with Miss Murray, knelt at the school-room window and breathlessly watched her as she drove away. There was always the chance that she might look back—might look up—though she never did. She did not now.

The carriage came back almost at once, but Mrs. Haviland was not in it. There were only the two men on the box, and a note from Mrs. Haviland to her husband.

When the footman brought it in, Mr. Haviland was in the hall putting on his overcoat to go for a walk up the avenue. He took the note, and as he read, his face turned to stone. He read it twice from beginning to end—it was not long. Then, quite quietly, he refolded the dainty sheet and returned it to its envelope, put it in his pocket, took off his overcoat and handed it to the waiting butler, all without a word, but still with that face of stone, and, turning, went slowly up the two long flights of stairs to his study, and there shut himself in.

An extraordinary stillness settled down all at once over the house. The servants, mysteriously sagacious, went noiselessly about their business as usual, lighting all the lights in all the great empty rooms, and setting out the dining-table with its customary elegance. But Mr. Haviland remained shut up in his study, and no dinner was served, and no orders were given, and Mrs. Haviland did not return. Miss Murray looked agitated and scared, and as if she were trying to shrink into herself out of the way of an impending shower-bath, and Ruth was sent to bed long before her hour.

The next morning Mrs. Haviland still had not come back, and the same hush of uneasy expectancy pervaded the house like a noxious atmosphere. Ruth had no idea of what had happened. She knew only that her adored mother did not come, though she watched and watched all the day long, and could scarcely be gotten away from the window.

So some vacuous, miserable days went by, each more wretched than the last. Then one morning Mr. Haviland summoned Miss Murray from the school-room to his study, and she was gone some time. When she came back, her soft, young-old face had lost its delicate color, and she could hardly take the seat at her desk for a nervous tremor through her. But the children's wide-eyed stare of curiosity forced her to pull herself together, and after a few moments she said to them quite simply, just as if she were stating a fact in physical geography, though with an uncontrollable twitching of her thin, ladylike lips, that Mr. Haviland wished them to know that their mother was never coming back at all, but was the same as dead to them, and that they must be obedient children and never so much as mention her name in his hearing. That was the point that Miss Murray laid the

most stress on—that they were never to speak of her again.

Harry did not mind a whit that his mother was gone away for always. He just opened his glorious eyes wider and asked: "Then who will take me out to drive when I have my good clothes on?"

Ruth made no outcry and asked no question. But the blackness of night descended upon her soul.

An hour later their father came in. Harry gave a whoop of delight, and, dashing his slate to the floor, ran to him tempestuously, shouting, "I want a nickel! Dad, give me a nickel!"

Mr. Haviland stood stock still and looked fixedly at his boy, the shadow upon his marble face deepening into something almost like contempt. Then he flung down a handful of small coins upon the carpet quite angrily, and went out of the room immediately, without having said a syllable to any one.

Harry laughed with glee as he flung himself upon the rolling bits of silver. The nurse chanced to be in the room, and Ruth saw her glance meaningly at Miss Murray as she muttered: "It's Master Harry's looks. He is as like her as two peas, and not in looks only, more's the pity!"

Ruth did not understand the full import of the words, though their dimly apprehended scorn roused in her an impotent fury, and she clenched her tiny hands under the table. No one ever guessed what of desolation it meant to the child when her beautiful mother disappeared so suddenly out of her life. But they all saw how listless and apathetic she grew, and how dully she went through her routine of small duties and pleasures, no one of which interested or aroused her in the least. The moment she was left to herself she always went directly to the school-room window, and sat there with her arms folded on the sill and her chin resting upon them, motionless save for the restless, roving eyes that missed no figure that went by. But she never told any one for whom she was watching.

Her father came regularly now to the nursery, where he had been used to come only occasionally. It was, however, merely to ask perfunctory questions of the nurse or governess as to the welfare of his children, and he was so changed, so silent and stern, where formerly he had been only grave, that Ruth shrank from him. With her mother's going, a blank wall seemed to have risen between her and everything else on earth. Miss Murray said of her with solicitous discontent that she was a singularly old little girl. And so she was, since heartaches count for years.

By degrees, as time went by and Ruth's abstraction increased, the talk around her grew less guarded, and one day, when two of the maids were whispering across their sewing, she overheard something that drove her straight to her governess with a point-blank question.

"Please, Miss Murray, where in this city is my mother's new home?"

Miss Murray was so taken aback and so flustered that all the little laces on her gown were set to quivering.

"Why, Ruthie—child—however—however did you find out that—that your mother was in the city at all?" she stammered.

"Ellen said so. She was talking to Sophie. She said that the new marriage was no better than a mock marriage. She said that she was brazen-faced to come back and take a house not ten squares away from us." The child's tones were fierce with uncomprehending resentment.

Miss Murray's gentle face wrinkled all over with perturbation. She laid a frightened, bloodless hand against Ruth's mouth.

"Hush, dear, hush! Ellen must have meant some one else. Ellen had no idea what she was saying. Ellen never meant anything."

Ruth pushed aside Miss Murray's hand roughly. An obstinate determination was over all her face.

"I want to see my mother. Where is my mother?" she said, doggedly.

The direct, insistent gaze was not to be avoided. Miss Murray's anxious brown eyes twinkled through a blur of tears as she looked at the child.

"Don't ask me, dear," she said, tremulously, vaguely conscious of some hitherto unperceived need of pity. "I may not tell you. You will know all soon enough, poor child! You are too young to be told now."

"I want to see her. I want to see her," Ruth repeated, stubbornly.

But the firmness of the gentle is not to

be overcome, and Ruth received no more elucidating answer. The insistence went out of her face at last, and she returned to the window, sitting there in a submissive, patient way that lulled Miss Murray's disquiet to rest.

Shortly afterward Ellen disappeared, and Ruth rightly guessed that she had been dismissed as a warning to the household against further indiscretions. The child apparently took no notice, but despair seized upon her. She grew thinner, whiter, stiller. The desire to see her mother was eating up her soul.

In the extremity of her need a daring scheme shaped itself in her quickened brain. The maid who took Ellen's place was a kindly, light-hearted girl, and Ruth, in pursuance of her ends, began to make friends with her in a covert, shy way, to which the maid responded with easy good nature, soon coming to feel a genuine liking for the reserved, odd child who thus singled her out for favor. And so Ruth craftily matured her plan.

"Aggie," she said one night, as the maid was putting her to bed in her lonely little room, "isn't to-morrow your evening out?"

"Yes, Miss."

"Where are you going?"

"I don't know, Miss. To see some friends, maybe."

Ruth looked at her with troubled, unchildlike eyes.

"Do you know where the opera-house is, Aggie?"

"Certainly, Miss. 'Tisn't so far from here. I've passed it often."

"Did you ever go there at night, Aggie? Did you ever stand outside and watch the people go in and out? Did you?"

"Why, no, Miss, I can't say as I have."

Ruth had tight hold of the girl's arm. A suppressed excitement had taken the place of her usual apathy.

"Aggie, you must take me there to-morrow night. There is to be a new opera. I heard Miss Murray say so. She said everybody would be there."

"But, Miss Ruth—" began the girl, protestingly.

The child shook her by the arm in her frenzy of desire.

"You are not to say anything to anybody, Aggie, or they would not let me go. But we can just slip out after I have said good-night, and nobody will know, and you can take the latch-key to let us in when we come back. Oh, don't say no, Aggie! Don't! *Don't!* I want to go so much! I *must* go, and nobody else would take me if I asked."

The maid stood aghast at the audacity of the proposition.

"But I couldn't take you out at night like that, Miss Ruth! I should lose my place the minute it come to be known, and good enough for me, too, if I did. You know I can't, dear. You must see I can't, or, indeed, I wouldn't want no praying."

Ruth pressed close. Her agony of longing was like an outgoing, compelling force.

"Aggie, you must! *You must!* Where's the harm? I only want to see all the pretty ladies in their fine gowns and gay cloaks, and the carriages hurrying up, and the horses jumping and kicking, and everybody shouting and calling. You never saw anything like it, Aggie! I heard somebody tell Harry once. We will just stand close by the door a tiny little bit of a while, and nobody will ever know we have been. Oh, Aggie!" she suddenly threw her frail arms chokingly around the girl's neck, and her voice broke into a childish, tearful, irresistible quaver. "Oh, Aggie, *darling*, I never wanted to do anything so much in all my whole life! Take me! *Take me!* If you do, I will love you as long as I live! *I will love you with all my heart and soul!*"

The girl hesitated, frightened yet fascinated at the bold idea. She was thoughtless and lively, eager to please and easily led, and she saw no risk to the child in the proposed escapade And if Miss Ruth really wanted a bit of a frolic so much—

Thus it happened that on the following night little Ruth found herself on the streets of the huge city, with only a foolish young nursemaid for protector. It was an altogether new world to the child—a world full of distortions, dangers, and alarms. All the familiar landmarks were obliterated. Everything was changed. The houses were taller and wider, and closed in before her crushingly. What lurking horrors might not spring out upon her from any one of their dark vestibules! It was like walking through a lane lined with Jack-in-the-boxes. The electric lights

glared at her savagely, with great angry eyes through monstrous radiating lashes. A deadly terror was upon her. But her purpose was stronger than her fear, and she kept on her way by Aggie's side, no sound of fright escaping her, not even when she was nearly run over by a cab, nor yet again when—more terrrifying still—a policeman seized her and swung her over a puddle at a street-crossing.

So much time had been consumed in securing an unobserved exit from her home that when they reached the opera-house it was already late, and there was nothing to be seen except rows of waiting carriages and dawdling footmen.

Ruth rallied from her disappointment as soon as its cause had been explained to her.

"We will go to see your friends, Aggie," she said, with quick decision. "You needn't mind taking me along. Then we will come back when the opera is out. It is sure to be best fun of all when the opera lets out."

And again Aggie yielded. It would be a shame for the child to miss what she had come for.

Two hours later they stood in the midst of a dense throng at the doors of the vast building. The evening was turned damp and chilly, and the wind blew in rude gusts down the avenue. But the scene was all that Ruth had depicted, and more, and Aggie became instantly an absorbed spectator.

"Nearer, Aggie! Nearer!" the child whispered, excitedly. "I must see them all. I mustn't miss any!"

She tugged at the maid's sleeve, her eyes hunting hungrily through the crowd. What if *she* had not come!

The people streamed out. Aggie and her charge were pushed mercilessly to one side. The child's heart beat to suffocation. What if she were there, and she should miss seeing her! She gave a sobbing cry.

"I can't see, Aggie! Oh, I can't see!"

It had begun to snow. The wind lifted the awnings, and the wet flakes blew in under. Ruth felt cold, moist touches on her face and neck. Her feet and hands were ice. She shivered, and big despairing tears welled over on her cheeks.

Then suddenly the crowd parted, and she saw her mother standing at the foot of the steps, waiting for a pair of thoroughbreds to prance their way to the curbstone. She was holding the arm of the tall blond gentleman whom Ruth had once seen riding beside her carriage, and was talking gayly to a group of young men. An electric light blazed down full upon her. The wind turned back the edges of her ermine cloak, disclosing the splendor of the gown beneath. Oh, how bewilderingly beautiful she was! How her smile flashed! How her jewels gleamed! How the white fur about her throat set off the face above—the fair, pure, lovely face that had in it no least trace of evil!

Ruth scarcely breathed. In her ecstasy the slow, long torture of the past months was as if it had never been. Her nondescript little face was transfigured. For the moment her ineffable love made her beautiful.

But the brougham was drawing up to the sidewalk. The gentleman whom Ruth remembered was moving toward it. The lady was bowing her adieux. Now her arched foot was upon the step. In another instant she would be gone—gone, lost, forever!

"*Mother! Mother! Come back!*"

The cry rang out, importunate, passionate, agonized.

The lady half turned, and threw a startled glance over her shoulder at the crowd. But the gentleman hurried her into the brougham and entered after her. She sank down on the cushions, her adorable face quite pale.

"I thought—I almost thought that was Ruth's voice," she said.

"Nonsense," the gentleman answered lightly, "how could it be? Besides, it would have been Harry's voice, not Ruth's, if you had heard it. Home, John."

The footman touched his hat, sprang to the box, and the brougham whirled away through the sleet.

It was half-past eight of the evening a week later. The same lady, still more charmingly dressed, still more ravishingly beautiful, sat in her new drawing-room, an opera-cloak about her, fan and flowers lying beside her on a table. The gentleman whom Ruth had recognized stood by the mantelpiece. He took out his watch.

"Patrick is late."

The lady glanced up with her entrancing smile.

"Yes. It is the second time. He should be dismissed."

She let the cloak drop from her shoulders, and, drawing the evening paper toward her, looked lazily down its columns. The gentleman yawned.

Suddenly she gave a wild cry, and leaped to her feet.

"George! *George!*"

He was at her side instantly.

"Darling, what is it?"

She clutched at his arm, pointing to an item in the paper. He bent over and read it aloud.

"'On Monday, March twenty-fifth, of pneumonia, Ruth, daughter of Harold Haviland, aged ten years and nine months.'"

The lady fell back into the chair, white as death, twisting her hands as if in bodily pain.

"It is my child—my Ruth! He calls her only *his* daughter—do you see? But she was mine, too. Ruth! Oh, Ruth!"

She gasped as if for air, pulling at the necklace about her throat. The string broke and the great pearls rained down over her bosom. Again she wrung her hands, lifting her head with a long, convulsive sob that seemed to rack her body. A new, strange look swept blightingly across her beauty.

Her companion laid his hand upon her shoulder. The change in her appalled him.

"It is a frightful shock, of course, but why should you take it quite like this?" he said, in constrained remonstrance. "You never cared for her, you know, and you were willing to give her up—to leave them both."

She was looking up at him, and all her frame cowered at his words. Yes, she had not cared, and she had been willing to leave her. The thought gripped her as in a vice, resolving every sense into a frightened consciousness of an intolerable anguish. Was this remorse? Is it in such wise that souls are born?

She dropped her face on the table speechlessly. She did not guess whose had been the cry of love and longing that a short week before had faintly stirred a response in her slumbering mother-heart. But deep down in that region so seldom entered, known to each as his true self, she knew that from henceforth the little daughter she had never loved would call to her forever from her grave to come back.

Books of the Week

This report of current literature is supplemented by fuller reviews of such books as in the judgment of the editors are of special importance to our readers. Any of these books will be sent by the publishers of The Outlook, postpaid, to any address on receipt of the published price, with postage added when the price is marked "net."

Ad Astra. Being Selections from the Divine Comedy of Dante. Illustrated by Margaret and Helen Maitland Armstrong. R. H. Russell, New York. 9×12 in. 100 pages.

The selections from Dante printed in this elaborately illustrated volume are in the main excellently chosen, but a singular fact is that more come from the "Purgatorio" than from the better-known "Inferno" or from the "Paradiso." Every one will first turn to the illustrations of Paolo and Francesca and of the fate of Ulysses—subjects familiar even to those who have never read a line of Dante. These and the rest are treated in a genuinely reverential Dantesque spirit; and the book is a real addition to the year's Christmas volumes.

Atlas of the Geography and History of the Ancient World. Edited and Arranged by John King Lord, Ph.D. Benjamin H. Sanborn & Co., Boston. 7½×12 in. 43 pages.

Dr. Lord, of Dartmouth College, has published an extremely valuable atlas edited and arranged from the latest sources. Such an atlas is indispensable to the serious student of history, and even to the student of geography, since that latter science is of little value except in its relation to the lives of men and to the civilization of peoples.

Battle with the Slum (The). By Jacob A. Riis. Illustrated. The Macmillan Co., New York. 6×8½ in. 465 pages. $2, net.

Mr. Riis vitalizes every subject that he touches, and in this volume he has vitalized sociology. He has put his own life into the battle with the slum, and the book which is the outcome is almost as personal as "The Making of an American"—or, at all events, it is much more personal than most autobiographies. The larger part of this volume has already been reviewed in these columns under the title "A Ten Years' War," but in extending that narrative so as to cover the work of the last three years—much of it along new lines of civic betterment—Mr. Riis has practically recast the whole, while the publishers, by means

of new and effective illustrations, have created a new book as attractive to the eye as it is stimulating to the social conscience. Mr. Riis believes that in the last three years we have advanced more than in the preceding thirty, and while this courageous bit of optimism may not win the assent of the reader's judgment, it is pretty sure to win his heart, and infect it with a desire to take part in the same hopeful struggle. Mr. Riis's optimism is not of the kind which says that "all is going well, therefore we need not struggle," but of that which says that "all is going well if we struggle." In other words, it is not the optimism which produces smug complacency, but that which produces exalted endeavor.

Book of Golden Numbers (The). By Kate Douglas Wiggin and Nora A. Smith. McClure, Phillips & Co., New York. 5×7 in. 687 pages. $2.

Among the many collections of verse for young readers none seems more thoroughly adapted to the children of to-day than that contained in this substantial and handsome volume. Kate Douglas Wiggin and Nora A. Smith are experts in the kind of knowledge which is essential to the preparation of a book of this kind. They know their poetry well, as many other editors have known it, but they also know, what many other editors have not known, the tastes, capacity, and interests of children. It is idle to select the kind of reading which children will not enjoy; admirable as such reading may be, it is a waste of time to collect it. Two things are essential in work of this kind: knowledge of the best, and knowledge also of the capacity of the child. The result of the possession of both these qualifications has made it possible for the editors of this little book to make an almost ideal collection—broad, comprehensive, varied, and quite on a level with the interests and tastes of children. There are probably very few poems in this book which a child of common intelligence and a little imagination will not thoroughly enjoy; while the taste of the editors has been so catholic, and their choice of subjects so wide, that they have included something for every kind of child. The tact of the woman, the knowledge of the teacher, and the skill of the trained writer are shown in the subdivisions which are most alluring: "Green Things Growing," "On the Wing," "Fairy Songs and Songs of Fancy," "A Garden of Girls," "The World of Waters," "For Home and Country." The volume has another unusual quality: all its introductory matter is interesting. The long introduction from the hand of Kate Douglas Wiggin is a charming piece of writing; while the short introductions which open the door to each subdivision, and are placed in the volume as interleaves, bear the trace of the hands of both editors and are well adapted to make one wish to know what lies beyond. This volume will be a delight in many a household where such a book ought to lie at hand to read to the children in the hour after dinner and before bedtime. It is full of the poetry which lives by reason of its beauty, its truth, and its vitality. It will charm the child for the moment, it will educate his tastes without awakening the suspicion that he is at school, and it will enrich memory for all time to come.

Coming City (The). By Richard T. Ph.D., LL.D. Thomas Y. Crowell & Co., New 4½×7½ in. 110 pages. 60c., net. (Postage, 8c

A plea for the development of an officehol class, composed of educated experts selec as teachers are selected for State univ ties, not by competitive examinations, bu freer though less tangible tests of efficie In thus recommending the freer tests of ciency Professor Ely in no way identifies l self with the friends of the spoils system, merely points out the limited usefulness civil service reform method in a governn not animated by a civil service reform spir

Consecration of the State (The): An Es By J. E. C. Welldon, D.D. The Macmillan New York. 5×8 in. 59 pages. 75c.

Starting from the religious aspect of the onation of King Edward, Canon Welldon tests against that secularization of the S which he understands English Nonconfo ists to aim at. The State he holds to b divine institution. To detach it from concern with religion is to lower its ideal lose reverence for it. In support of his ar ment he quotes Channing, and points to example given in the religious observan fostered by our Government. Irreligion te downward to Anarchism. Canon Welld seems to misunderstand what English N conformists want, but they will see to that. his argument was intended to strengthen church interest in the present educational c troversy, it is a paralogism. But, on the otl hand, it may serve as a wholesome correct to certain extreme tendencies of thought b there and here.

Electricity. By George L. Fowler. Ill trated. The Penn Publishing Co., Philadelpl 4½×6 in. 205 pages.

A clear, concise treatise dealing with the c struction and operating of electrical apparat with the practical rather than the theoreti aspects of electricity.

Erromanga: The Martyr Isle. By Rev. A. Robertson. Edited by John Fraser, B.A., LL. A. C. Armstrong & Son, New York. 5½×8 in. pages.

This is a fitting companion book to the wide known autobiography of the "Apostle to t New Hebrides," the Rev. John G. Pato Erromanga is one of that group of islands, a is deeply stained with the blood of missio aries, for which the outrages committed foreign traders were largely responsibl Here, however, Christianity has been secure planted, and its fruits abound. The auth has been engaged in this noble work for son thirty years, and writes the story of it at t request of the British churches that sent hi forth. It is thoroughly interesting and copiously illustrated.

Four Princes: A Story of the Christian Churc Centered around Four Types. By James A. Scherer, Ph.D. The J. B. Lippincott Co., Phil delphia. 4½×7½ in. 276 pages. $1.25, net.

The study of history by epochs in which ant cedent movements are summed up, and fro which fresh developments start, is not ne

but it is here applied in a new way. Four representative characters—Paul, Constantine, St. Bernard, Luther—severally representing the missionary, the secularizing, the saintly, and the reforming spirit, are selected to stand for the efficient factors in the history of the Church, and also for the four great racial influences that have given form to organized Christianity. With this interesting conception of Christian history Dr. Scherer has wrought out an attractive narrative in popular form. He writes from the Lutheran standpoint, in which the glory of Luther sometimes occults other stars, and one is occasionally tempted to demur, *e.g.* to his judgment that the German Reformation was "largely responsible" for what Tennyson calls

> The red fool-fury of the Seine,

the gory cruelty of the French Revolution.

General History Way Marks. By Charles C. Boyer, Ph.D. The J. B. Lippincott Co., Philadelphia. 5×7½ in. 192 pages. 65c.

This is both a desirable and a serviceable manual. It aims at helping the student of history not to lose amid the crowd of details the logical thread connecting events. Such a manual is therefore not for independent use, but as a companion-book to larger works. Here and there are careless statements, *e. g.*: "With it [the year 1689] began the long struggle between England and France for colonial independence."

Hidden Manna. By A. J. Dawson. A. S. Barnes & Co., New York. 5×7¼ in. 322 pages. $1.50.

An intensely vivid, photographic story of native life in Morocco. It is dramatic rather than romantic, and its style is hard and not very sympathetic. It has been the fashion to call many recent writers the Kiplings of this place or that, often without much aptness, but it may truly be said that Mr. Dawson does for Morocco very much what Kipling did for India. There is a little that is repellent in this tale, and sometimes it is too high pitched, but the reader actually feels himself set down in the places and among the people described. In story interest, too, it is strong and absorbing.

History of the Expedition of Captains Lewis and Clark, 1804-6. Reprinted from the Edition of 1814. With Introduction and Index by James K. Hosmer, LL.D. In 2 vols. A. C. McClurg & Co., Chicago. 6×8¾ in. $5, net.

The one hundredth year since the Louisiana purchase made the United States a thoroughly continental power is an auspicious time for the republication of this famous story of our first pioneering into the wilderness, since transformed by the advance of civilization. The original work is now found only in libraries; Dr. Coues's reprint in 1893 is out of print; the present publishers have wisely anticipated the demand of the centenary year for a new edition. This is furnished with a historical introduction by a most competent hand, in which the events that led up to the great exploit are so related as to show its great significance. The title-page and maps of the original edition are reproduced in facsimile with the best extant portraits of the heroes of the enterprise, whom Dr. Hosmer fitly terms "the Dioscuri of American tradition."

Modern Eloquence. Edited by Thomas B. Reed and Others. In 10 vols. The John D. Morris Co., Philadelphia.

The recent death of the editor-in-chief of this work and the ensuing estimates of Mr. Reed as statesman and orator may naturally attract special attention to his own discussion on "Oratory, Past and Present," which appears (rather oddly placed, one would say) in the fourth volume of this work, one dealing with Lectures. Quite characteristically, Mr. Reed begins by declaring facetiously that Republicans and protectionists in reducing the cost of white paper have a heavy responsibility on their consciences. But while he mildly satirizes the floods of printed eloquence now preserved by the newspaper for every man's reading, he distinguishes forcibly between the two kinds of public sentiment, "the voice of the people which is the hurried result of the untrained and uninstructed emotions, and that voice of the people, uttered after due thought and experience, which is the solid and enduring basis of human action," and with equal force between the men who stir the surface of thought for the moment and the great orators who have left permanent landmarks. In the work of preparing this ten-volume compendium of orations, after-dinner speeches, lectures, and occasional addresses, Mr. Reed had the assistance of the English writer and statesman Mr. Justin McCarthy, whose contributions to The Outlook have made him especially well known to our readers, that of Mr. Rossiter Johnson, an American author and journalist of wide and deserved repute, and that of Mr. Albert Ellery Bergh, a trained specialist in the making of compendiums. The editors have been aided by a Committee of Selection made up of Dr. Edward Everett Hale, Senator Gordon, Senator Dolliver, Major Pond (who surely ought to know an orator at sight, if any one does), and several editors and professors. Introductions and special articles are furnished by Mr. Reed, Dr. Hale, Senator Dolliver, Mr. Bergh, Mr. H. W. Mabie, the Hon. Champ Clark, and Professor Lorenzo Sears. Moreover, many of the orators and speakers represented kindly consented to point out what they thought to be their own most valuable speeches. It is inevitable that such a work should contain some things not worthy of preservation, but a careful examination will show that the proportion of chaff to wheat is reasonably small. The general plan is a good one, has been worked out systematically and on a large scale, and as a whole the ten well-printed and handsomely bound volumes fairly and fully represent the best public utterances of nearly a hundred famous and brilliant American public speakers, besides anecdotes, stories, and illustrations innumerable. The scope of the work includes the hundred years just past; but relatively more attention is given to the men of our own day than to the fathers; this appears to be intentional, and it is for this reason probably that the work is less strong considered on the historical and political sides

than one would expect, while it is remarkably full as regards after-dinner oratory and occasional addresses of rather recent date. The section devoted to lectures is also large, and it is certainly a profound pleasure to have here the opportunity to read in their entirety addresses by Beecher, Collyer, Emerson, Curtis, Gough, Wendell Phillips, Froude, Huxley, Morley, Thackeray, and many other giants of the lecture stage, even though some lecturers not exactly gigantic are included. This section alone contains a really extraordinary amount of matter well worth having. It is hardly necessary to point out the value of this work to students and public speakers *in esse* or *in posse*. The compilation has been prepared with lavish outlay of time, thought, and money, and we do not for a minute doubt that it will be warmly appreciated and form a useful addition to many libraries, private and public. A word of praise should be added for the scores of portraits, most of which are notably well reproduced and finely printed.

Nathaniel Hawthorne's Romances. In 14 vols. (The Handy Volume Edition.) Thomas Y. Crowell & Co., New York. 4×6 in. Per set, $10.50.

This is the latest of the many and extremely useful handy-volume editions of standard authors which the publishers have been giving us of late years. The Lenox Edition comprises fourteen small volumes, of about three hundred pages each, containing all of Hawthorne's work in fiction, with the addition of "The Grandfather's Chair" and the biographical stories, and including, of course, "Mosses from an Old Manse." The edition is substantially the same as the Virginia Poe. A good clear type is used; and, although the paper is thin, clearness and legibility are secured. Each volume contains a photogravure frontispiece and a rubricated title-page. Miss Katharine Lee Bates, of Wellesley College, a well-known and very successful teacher of literature, has prepared a series of introductions giving the significant facts connected with the genesis of the different romances. This edition not only meets the demands of a good library edition, but is of a size which permits the lover of Hawthorne to carry a volume with him on his journeys and to take up the greatest of American writers of romance in those times of waiting and journeying which are so many in our busy modern life, and which are often wasted because no book is at hand.

Ohio and Her Western Reserve: With a Story of Three States. By Alfred Mathews. Illustrated. D. Appleton & Co., New York. 5×7¼ in. 330 pages. $1.25, net.

A spirited narrative which will be read with interest by all Ohioans. The author gives two significant reasons for the exceptionally influential place which Ohio obtained in the Nation's counsels—particularly after the slavery question came to be the paramount issue in our National politics. The first of these is that Ohio was the first State settled by people from every section of the country, and a composite America in miniature. The second reason for Ohio's commanding influence is the moral seriousness which early marked her political life—due in part to the presence of anti-slavery immigrants from the South attracted to her borders by the free labor clause in the Ordinance of 1787.

Peasant and the Prince (The). By Harriet Martineau. (The Riverside Literature Series.) Houghton, Mifflin & Co., Boston. 4½×7 in. 204 pages. 30c.

Polly State, One of Thirteen. By Frances J. Delano. The Pilgrim Press, Boston. 5×7½ in. 259 pages.

Proverbs. By John H. Bechtel. The Penn Publishing Co., Philadelphia. 4½×6 in. 201 pages.

This is a copious collection, conveniently arranged and indexed. It is open to the criticism that there is a distinction, of which it takes no note, between a proverb and a pro verbial expression.

Rollicking Rhymes of Old and New Times. By N. W. Bingham. Illustrated. Henry A. Dickerman & Son, Boston. 5×7½ in. 62 pages.

Satire of Seneca on the Apotheosis of Claudius. A Study by Allan Perley Ball. The Macmillan Co., New York. 5×7½ in. 256 pages. $1.25, net.

In accordance with the Roman custom of deifying a deceased emperor, Claudius, when poisoned off to make way for Nero, became a god. As he had been an object of ridicule as a "cabbage-head," his deification gave occasion for this satire, attributed to Seneca, who bore toward him a personal grudge as well as a philosopher's contempt. Its very title is satirical, substituting for "apotheosis" *apocolocyntosis*, "pumpkinification." An essay on the critical questions of authorship, etc., connected with the satire is here included with a translation of the text and notes. The former was originally a thesis for the doctorate of philosophy at Columbia. The whole forms a desirable and creditable addition to the classical library.

Songs in the Night. By A. Parke Burgess, D.D. W. C. & F. D Burgess, Newark. 5×8½ in. 112 pages.

Steering Gear. By Frank Andrews Fall. Leavens & Langdon, New York. 5×7 in. 47 pages. Paper bound.

Tolstoï as Man and Artist: With an Essay on Dostoievski. By Dmitri Merejkowski. G. P. Putnam's Sons, New York. 5×7¾ in. 310 pages. $1.50.

A profound essay upon the contrasted spiritual development of Tolstoï, the child of fortune, and Dostoievski, the endurer of hardships, and a criticism of the literary art through which the two contemporaries impressed themselves upon the higher life of their nation. The sympathies of the essayist are rather with the great Slavophile than with the great internationalist who pronounces patriotism the agency of the rulers for the enslavement of the masses, but the genius of both men is analyzed with almost loving reverence as well as with keen literary acumen.

World Before Him (The). By Horatio Alger, Jr. The Penn Publishing Co., Philadelphia. 5×7½ in. 383 pages. 90c., net.

A recent plebiscite of boys' rôles showed Alger to be by far the highest favorite. Critics do not like him as well, but boys, not critics, form his audience.

The Latest Delaware Election

The election for Member of Assembly in the ninth representative district of Kent County, Delaware, which was held at Harrington and Farmington on Tuesday of last week, gave J. Edward Addicks another vote in the contest that he is making for the United States Senatorship, and furnished another proof of the gradual disintegration of the Democratic party in southern Delaware under the influence of Mr. Addicks's money. The ninth district of Kent County is normally Democratic, and in 1900 it gave a Democratic plurality of 119 on a total vote of about 800. In the general election two months ago this plurality was wiped out; and as the Addicks candidate and the Democratic candidate were tied—each receiving 424 votes—another election was ordered. This election was held on Tuesday last, and resulted in a plurality of 192 for the Addicks candidate, Mr. Powell. Inasmuch as the candidates presented and the questions involved in Tuesday's election were exactly the same as in the election of November 4, the extraordinary and unprecedented change from a tied vote to an Addicks plurality of 192, in less than eight weeks, raises, naturally, a presumption of fraud. An analysis of the vote shows that the gain of the Addicks candidate was made chiefly at the expense of the Democrats, who, to the number of 120, absented themselves from the polls. A staff correspondent of The Outlook who has been studying the Delaware situation on the ground writes that it is charged by the Regular Republicans and the Democrats that, after the November election, Addicks "workers" drove about the district for weeks bribing purchasable Democrats not to vote; that by a lavish use of money they induced forty men in the northern part of the district and sixty or eighty in the southern part to stay away from the polls, and that then they bought enough "floaters"—chiefly negroes—on election day to make up their plurality of 192—paying for them at the rate of from $5 to $20 per vote. If Mr. Addicks's money holds out, and if he be not deterred by criminal prosecution from further buying of votes, there is little doubt that two years hence he will carry every election district in the counties of Kent and Sussex, get absolute control of the Legislature, and go, with another Union Republican of his own choice, to the Senate of the United States. His managers openly boast that if they do not elect Mr. Addicks to the Senate this winter they will "wipe up the earth" with the opposition in 1904.

❀

The Situation in the Delaware Legislature

Under the new State Constitution the General Assembly of Delaware consists of seventeen Senators and thirty-five Representatives, and when the two houses meet in joint session on the 20th of January, to ballot for United States Senator, twenty-seven votes will be needed to elect. The numerical strength of the respective parties in the present Legislature is believed to be as follows: Union (Addicks) Republicans, 23; Democrats, 21; Regular (anti-Addicks) Republicans, 8. Mr. Addicks, therefore, lacks four of a majority, and cannot be elected without the aid of four men from the ranks of the opposition. That he will secure such aid seems at present to be in the highest degree improbable, although it is alleged that he would pay, without hesitation, $25,000—or even $50,000—apiece for the votes that he requires. The feeling of hostility to him in the Regular Republican party is so strong that he cannot possibly get any support from that source, and the Democrats are confident that none of their men would dare to sell out

to him, even if they should feel so disposed. In the present excited state of public feeling, a Democrat who should vote for Mr. Addicks would probably be thrown out of one of the State House windows. All that Addicks can do at present, therefore, is to hold up the Legislature and prevent the election of anybody, and this he can do only in case personal and factional ambitions and animosities prevent the Democrats and Regular Republicans from combining against him. If there be no choice of United States Senator this winter, the responsibility for the failure to elect will rest, first, upon Mr, Addicks, and, second, upon the Regular Republican party. The Democrats are willing to enter into a combination with the Regular Republicans, provided the latter will give them one of the two vacant Senatorial seats. They do not even insist on having the long-term Senatorship, but will take the short term and give the long term to the Regulars if the latter will help them to eliminate Mr. Addicks as a factor in Delaware politics. This, however, the Regular Republicans are not now disposed to do. Some of them are personally hostile to Willard Saulsbury, who would probably be the Democratic nominee, while others have Senatorial ambitions of their own with which a coalition might interfere. As The Outlook believes in the party system of government, it can understand the reluctance of Democrats to ally themselves with Republicans, or *vice versa*, in ordinary political contests. But this is not an ordinary political contest; it is a National scandal.

❀

The Defeat of a State Boss

Rhode Island enjoys the political distinction of being the only State north of the Potomac and east of the Mississippi having a Democratic Governor. Dr. Lucius C. Garvin was elected to the gubernatorial chair last autumn on the Democratic ticket by the astounding plurality of over 7,000 in a State which for years has been overwhelmingly Republican. While the Legislature of the State has a joint Republican majority, it is not so large as to make it impossible for Governor Garvin to influence in a very considerable degree the legislative as well as to direct the executive branch of the State government. A very interesting and picturesque st the story of the defeat of a powerful strongly intrenched boss, is connec with Governor Garvin's election. many years Rhode Island has been a b ridden State, General Charles R. Bray having been the commanding and cont ling figure in Republican State politics nearly a quarter of a century. Gen Brayton was a brilliant soldier in the C War, and, like many of his fellow-office went into politics. He became postmas of Providence, one of the most desira offices in the State, but lost his posit owing to an alleged improper politi use on his part of Government mon For a time the machine politicians ignor him, but he soon regained his politi position, and it is hardly too much say that he has assumed and exercis the function of a political dictator. Mu of the time he has held no political offi but has had his desk in the State Capit from which he has guided and direct legislation. A few years ago he beca blind, but this did not interfere with l control over the machine. At his desk has received Representatives, Senato and corporation agents on equal tern There is a current story that once became impatient at a long session of t House, and, after waiting for his lunche until his hunger increased and his patien diminished beyond the point of endurand he summoned the Sheriff and instruct him to go in and see that the Hou adjourned. What the Sheriff did is n a matter of record, but it is known th when General Brayton reached his hot the House had also reached it. Und General Brayton's influence very obnoxio corporation laws have been passed Rhode Island. Indeed, his success in co trolling and shaping legislation for pure material ends and with very little regar to the rights and welfare of the people large brought him to that state of min which has preceded the downfall of s many political bosses before him.

❀

The Victory of a Persistent Reformer

For nineteen years Ge eral Brayton and th "organization" have ha a quiet but persistent opponent. Dr. Lu cius Garvin, a country physician, has bee constantly elected from his district as

Democrat even in years when the Republicans were overwhelmingly in control. At first the bills that he introduced and the speeches that he made were either ignored or ridiculed. He was considered a crank and a radical, but finally some of his measures began to attract popular support. He persisted in writing to the papers and making public speeches advocating the measures which he had unsuccessfully introduced into the House. In this way the State at large gradually learned something about his personality, his character, and his political beliefs. He was instrumental in the passage of the factory inspection law, of the bill to make the working day for motormen and conductors ten hours, and in the abolition of the landed-property qualification of the suffrage. This enlargement of the suffrage increased the vote of Rhode Island about a hundred per cent., and was of course of direct and distinct advantage to those whom Lincoln called "the plain people." The serious street railway strike of the employees of the Rhode Island Electric Railway last summer, which involved the cities of Providence and Pawtucket in dangerous rioting, was a factor in the election. It was alleged that General Brayton, the head of the political machine, had practically acted as a special agent of the Rhode Island company in the passage of legislation favorable to its interests. Dr. Garvin, who opposed the political injustices which he believed were practiced by the Rhode Island company, not only surprised the State by winning the Democratic nomination against formidable opposition, but, having been nominated, still more astonished the expert politicians by winning the election. It is another instance of the fact that powerful boss rule may be, and often is, overthrown by patient, persistent, and upright effort to guard and preserve the real interests of the public. What Dr. Garvin will do in the executive chair time only can tell, but we earnestly hope that he will show such a combination of practical wisdom and scrupulous integrity that the political managers of the State may be convinced that honesty is the best policy, even if they are unable to understand, aspire to, or practice honesty on other and higher grounds.

The Philippines: Official Reports

The annual report of the Philippine Commission, and also a separate report from Governor Taft, have just been made public by the War Department. With regard to existing conditions, the reports agree in stating that armed opposition to our forces has practically ceased, that civil government has been extended in a hopeful way, that ladronism continues to be the great curse of the islands, and that its prevalence is largely due to the lamentable condition of agriculture, caused partly by war and the ravages of cholera and partly by the loss through disease of nine-tenths of the water-buffalo, on which the cultivation of rice is entirely dependent. Governor Taft states that the Moros do not understand popular government and do not desire it, and that the control by dattos or native chiefs may cease far in the future, but at present it is necessary to provide "a paternal, strong, but sympathetic government for these followers of Mahomet." During the year ending June 30, 1902, imports have amounted in full to forty-one millions, exports to twenty-seven millions; capital seems to be timid in going to the Philippines. In the recommendations of the two reports stress is laid on the need of currency reform and the reduction of duties on imports into the United States from the Philippines—the Commission recommends a reduction of at least seventy-five per cent. Governor Taft speaks earnestly about the labor problem, and commends the organization of labor unions as likely, if properly directed, to give laborers a sense of the dignity of labor and of their independence. He declares the objections to the unlimited introduction of Chinese to be logical, and thinks it would prove an obstacle to the opening of markets for Philippine products by the United States. The Commission, on this point, ask that power be given to admit a limited number of Chinese, certified to be skilled laborers, "on the bond of the employer that for every Chinese skilled laborer employed he will employ a Filipino apprentice, and that he will return the Chinese skilled laborer thus introduced within five years after his admission to the country, and that he shall pay a tax of not exceeding $50 for each Chinaman so admitted to the insular government to meet the expenses of the

enforcement of these restrictions." It will be noted that this proposition contains at least one important restriction not contained in the plans for admitting Chinese labor which have hitherto been discussed in this country. Nevertheless, the imposing of these restrictions does not meet the objection that the plan essentially amounts to authorizing coolie contract labor, under which the laborers would for years have no control of their own industrial conditions. Other important recommendations of the Commission are that individuals or corporations may be allowed to hold interest in more than one mining claim; and that the amount of public land which may be sold or held by individuals or corporations shall be increased to twenty-five thousand acres, the argument being that, as the Government owns sixty-five out of seventy million acres, there is no danger of concentration of ownership in individuals or corporations.

❀

The Tariff on Art

The bill removing the duty on works of art provides that works of art which were created fifty years before the date of importation shall be free of duty. Some obscurity of statement in the comment of The Outlook upon this bill two weeks ago led to misapprehension as to the provisions of the bill. The movement of which the bill is the expression seems to be gaining ground. Mr. Kenyon Cox, the Secretary of the Fine Arts Federation, recently said that, while there might not be any action on the bill during the present session, it was hoped that a hearing would be given by the Ways and Means Committee in order that the arguments in favor of the bill might be laid before Congress and so before the country. It is hoped also to engage the personal attention of President Roosevelt, whose interest in all matters relating to the development of the higher civilization of the country, and whose sympathy with art in all its forms, would naturally commit him to a wise and most generous policy. The most noticeable aspect of the agitation is found in the fact that there is no serious opposition to the proposed modification of the tariff law. No official body or person has recently declared in favor of the protec-

of the American artist. It would seem as if the time were ripe for entire removing the tariff from works of art; bu in the judgment of the men who have tl matter in charge, it is better to tal one step at a time. The few peop who think that art can be protected a not opposed to the free importation works of art which are more than fif years old. Mr. Ruckstuhl, who has r cently resigned his position in charge the sculpture at the World's Fair to b held in St. Louis next year, declares th he regards any tax on art from the poir of view of protection as absurd. It i in effect, a denial of American talent i art. The American artists are amply abl to take care of themselves; they have mad great advances during the past few years they have developed men who rank wit the first artists of the world, and they ar creating a new school of art which promise to take its place with the great schools o the past. In Mr. Ruckstuhl's judgment the taxing of collections made in Europ by such men as Mr. Pierpont Morgan composed as they are largely of work of art that can never be duplicated, i absurd:

> We have first-class painters and sculptors although not so many as there are in Europe But a picture of an old master cannot possibly compete with modern works of art, because i was painted when the art of painting was practiced as it never can be practiced again It was the reflex of a spiritual and intellectual condition which cannot be repeated here. Our modern tendency is in a different direction. A painting by an old master would be an acquisition, as are the writings of Homer, Virgil, and Dante, which were the result of a different spiritual atmosphere from that of to-day, and must be appreciated simply for their intrinsic beauty, for the expression of a life and a social state which are forever past, and, therefore, in a large measure must be entered in the category of archæological and ethnological things, so to speak.

❀

The Coal Scarcity and Dearer Oil

The coal famine remains unbroken, although the December output at the mines was the greatest on record. The mild weather in the anthracite-using district last week kept the situation from becoming acute, but even in New York City, where the coal roads converge, the great body of consumers are compelled to pay from eight to ten dollars a ton. Those who have turned to the use of oil in this emergency have been chagrined to

find the price of this fuel also advanced. Almost at the same time that the Standard Oil Company announced another dividend—bringing the aggregate of the year up to forty-five per cent. on its $100,000,000 of capitalization—it advanced the price of oil a cent a gallon in barrels, and two cents a gallon in cases. The Standard Oil Company is so continuously cited by trust apologists as their illustration of the possibility of lower prices through the monopolization of an industry that it is of interest to compare present prices with those prevailing when the monopoly was established in 1882. An examination of the record shows that oil to-day is actually dearer than it was twenty years ago. Prior to that time the price of refined oil had fallen, as a rule, from seven to ten per cent. each year ever since petroleum was first put upon the market at the beginning of the Civil War. Export prices by the barrel mean little to the ordinary consumer, but they form the official basis of comparison. In the decade preceding the complete establishment of the trust the export price of oil by the barrel in New York fell from 24 cents a gallon to 7½ cents. During the two decades following this event, the price of oil by the barrel has risen from 7½ cents a gallon in 1882 to 8½ cents a gallon in 1903. If improvements in manufacturing and economies in production have gone on as in the days of competition in the oil industry, the public has surely not received the benefit.

❀

The Steel Trust's Profit-Sharing

On New Year's Eve the United States Steel Corporation announced an elaborate plan—or rather two elaborate plans—which it has adopted for sharing future profits with its employees. The first of these, which is open to all its employees, but particularly to the ordinary wage-earners, offers them the opportunity to purchase on extremely easy terms 25,000 shares of preferred stock at a trifle less than the current market price, and promises them thereon not only the regular seven per cent. dividends whenever earned, but also a further dividend of five dollars a year for each share so long as the owner remains in the "continuous" employment of the Corporation. The employees are divided into five grades according to the amount of their earnings, and those of the fifth grade—getting $800 a year or less—are permitted to invest 20 per cent. of their year's earnings in the preferred stock, while employees of the next higher grade may invest but 15 per cent., and those of the very highest grade only 5 per cent. Furthermore, the employees of the higher grades cannot purchase any of the preferred shares until the subscribers of the lower grades have received their full allotment, if they care to buy shares. This feature of the offer calls attention to the fact that only a minority of the employees can become profit-sharers under this scheme, as there are only 25,000 of the "profit-sharing shares" and there are 168,000 persons in the employment of the Company. Expressed in simple terms, therefore, the amount of the offer is this: The Company will help several thousand of its employees to become shareholders, lending them, if necessary, at 5 per cent. interest, the money needed to buy the shares. To these shareholders, so long as they remain in the continuous employment of the Company, it will out of its profits distribute a bonus of $5 a share, or $125,000 in all. This means a bonus of $10 a year to the workman who gets the two shares for which most of them are allowed to subscribe, but if it were distributed among the whole body of the employees it would amount to less than a dollar apiece. The other portion of the profit-sharing offer is decidedly liberal. This is made only to those holding official positions or in some way responsible for economical management. To members of this class the Company offers a share in the profits rising from 1 per cent. when the profits aggregate $80,000,000 a year to 2½ per cent. when the profits reach $150,000,000. Upon the profits reported by President Schwab last May ($115,000,000), the bonus paid to officials under this plan would have been 1.6 per cent., or $1,840,000—or fifteen times the bonus allotted to workmen becoming shareholders. The New York "Tribune's" despatch from Pittsburg reports that the higher officials warmly applaud the new plan of profit-sharing, but that the workmen almost universally condemn it, declaring that the bonus offered them is of little value and bound by

conditions lessening their freedom to quit work. Other despatches, however, indicate that some of the workmen are eagerly subscribing for the preferred shares, and the friends of profit-sharing hope that the purpose of the Corporation to express and promote good feeling between employers and employed may yet be achieved among the wage-earners as it already is among the employees holding the more responsible positions.

❀

Street Railway Conditions

Two important and definite results have already followed the investigation into the intolerable conditions now existing on the street and elevated railways in New York. The investigation of the New York Street Railway Commission was really forced by the fact that the crowding of the cars and other objectionable features had reached such a point that the public could no longer endure them. The Commission has now issued a peremptory order directing the elevated railways to continue during what are called non-rush hours the full service afforded in the rush hours; it has also directed that the elevated roads shall by the end of March add three hundred cars to those already in service (thus giving room for fourteen thousand more passengers than under the present service), and that a third track be constructed in certain parts of the system. While the officials of the road say, with some appearance of justice, that less than the full service may suffice to seat all passengers at certain times of the day, it is certain that accommodation has not been furnished at times when it might easily have been provided, and it would be difficult to frame an order which would accomplish the end sought in any other way than by demanding full service all the time. The other result of the investigation to which we have referred was the rather startling recommendation of the Grand Jury of Kings County in its presentment as to the service provided by the Brooklyn Rapid Transit Company. The Grand Jury not only emphatically asserted that the cars are poorly ventilated, dirty, badly lighted and badly heated, and that the crowding of people in them during the rush hours is shameful and indecent, but it went further, and, after making specific recommendations for municipal legislation on the points above stated, advised municipal control and operation. Whether or not this recommendation by the Grand Jury is beyond the usual scope of the action of such a body is a matter of no particular importance; it is of very great public interest that an official and legal body of this kind should reach this solution. The presentment of the Grand Jury declares that "the efficiency and advisability of the participation of government in this sort of work has been abundantly demonstrated," and it points to the water system of New York and other large cities, the economical conduct of gas plants owned in many cities of the United States and Great Britain, and especially the management of the Brooklyn Bridge, as convincing examples of what may be done through municipal control. Finally, the Grand Jury recommends that the municipality of New York acquire all the street, elevated, and tunnel railway systems, and operate them for the benefit of the city, with the further suggestion that the Attorney-General might properly take action for the forfeiture of the franchises of these companies on the ground that they have not performed the functions allotted to them by their charters, and that after such forfeiture the city could properly obtain control. It is not probable that these recommendations will be followed immediately or as a whole, but the action of the Grand Jury has certainly set the people of the city thinking about the possibilities of municipal control in the future, and it should at least prove a warning to the companies involved that public utilities must be so managed that public comfort and public decency shall be maintained.

❀

The Insurrection in Morocco

Last week's news from Morocco was hardly of a reassuring nature. The country is suffering from a case of "Pretender." In the present instance the Pretender's name is Omar Zarahuni, a native of the mountain district near Fez, the capital. He began his mission, it is said, with such clever exhibitions of conjuring tricks that the superstitious natives came to regard him as possessed of superhuman power. Omar was not

slow to take advantage of his opportunity and began to preach larger things, taking care also to preach humility of spirit. He rides only a donkey, so it is reported, and is preceded by a man carrying a prayer-rug. He inaugurated a jehad, or holy war, against the Sultan, and, in his own opinion, so close to success has he come that he has appointed viziers and other officials and set up a court with every symbol of royalty. After taking several strongholds, he besieged Fez itself, but, perhaps because of unexpected resistance, now claims that he is fighting, not to seize the throne himself, but in order to enthrone the Sultan's brother, who had been unjustly degraded and imprisoned, but has now been released by the Sultan. The army of the Sultan has been already severely crippled; he is now strengthening the defenses of Fez. As the insurrection extends to the wild tribes who live on both sides of the still rather inaccurately defined Moroccan frontier, France has ordered thither detachments from the twenty-five thousand zouaves and tirailleurs who guard the Moroccan-Algerian hinterland, while Spain patrols the African coast with war-ships. Thus the insurrection may yet involve the Powers, despite their joint assurance last week that they would regard it only as "an internal affair."

❀

The Future of Morocco

Bismarck once prophesied that the Moroccan question would set all Europe by the ears. But the question is simpler than it was in his day. It is seen that France, because it now possesses all the land about Morocco, is the Power chiefly interested in Morocco's future; indeed, were Morocco added to Algiers and Tunis (the only really admirable French colonies), the last obstacle to a great, logically rounded French North African empire would be removed. Hence, France has long been looking for an excuse to invade Morocco, of course "as a protective measure." When that invasion occurs, it will be far more significant of future control than Spain's descent upon Ceuta or England's upon Tangier. Those are coast places on the fringe of the great unconquered country. For Morocco itself has never known foreign dominion. The Turks progressed westward no further than Tunis and Algiers, and the Arabs no further than the Moroccan lowlands. The people of the main part of the country, of the mountains, have always been independent, fierce, fanatical. Neither France nor any other Power will easily conquer those mountain tribes. Yet if France does this ultimately, the Powers will also demand, and rightly, the fulfillment of certain conditions. Spain, as the nearest part of Europe to Morocco, as possessing Ceuta and Melilla on the Moroccan mainland, and as having a greater number of subjects in Morocco than those from any other European country, might be pacified by a great money equivalent in return for Spanish-African territory, and by an entrance into the Franco-Russian alliance. England, as the possessor of Gibraltar, opposite and close to Tangier, would demand a guarantee that a free highway to the Orient should be preserved. Germany would stipulate that her traders now busily at work in building up a new market (ousting the English, who in Morocco have hitherto had twice the trade of any other power) should be protected in their present extraordinary privileges. This protection, however, should not be the exclusive possession of any one nation; it should be extended to all traders. As the brave Boers have fallen before the British, so the savage Moors may fall before the French. But, as the world's commerce will be the gainer through the opening to it of South Africa, so the open-door policy should one day be applied to North Africa.

❀

The Imperial Durbar at Delhi

The culmination of the splendid festivities at Delhi in honor of Edward VII. was his proclamation as Emperor of India on New Year's Day. India is always fond of gorgeous spectacles, and the ruling nation has always encouraged Oriental magnificence and has indeed cleverly used it for the support of Occidental rule. Lord Curzon, the Viceroy of India, and Lady Curzon, his American wife, were surrounded by a brilliant group of notables, white and brown; the Duke of Connaught represented his royal and imperial brother; Lord Kitchener stood for the military might of the Empire; native princes and

rajahs clad in silks and resplendent in jewels surrounded the amphitheater whence the proclamation was made; on the plain around were thousands of soldiers, not only British, but Pathans, Ghoorkas, and other native regiments, batteries drawn by elephants, cavalry in picturesque variety of uniform, and beyond a vast multitude of the common people in clothing of many hues. The durbar was opened with the flourish of trumpets, the royal standard was raised on high, bonfires were lighted far and wide, and finally the Viceroy read a message from King Edward, renewing "the assurances of my regard for the liberties of the Indian people; of my respect for their dignities and rights; of my interest in their advancement, and of my devotion to their welfare." Lord Curzon's own address prophesied prosperity for India, and incidentally announced that it had been decided not to exact interest for three years on all loans made or guaranteed by the Government of India to the Native States in connection with the recent famine. One especially interesting feature of the durbar week (for a whole week was given up to ceremonies and functions) was the opening of the Indian Arts Exhibition. Lord Curzon's address was a strong plea for arresting the progress of decay in the native arts, and the debasing of modern models. He said that it was certain that if many old Indian arts and handicrafts were to be revived and placed in a flourishing condition, it could only be done by the patronage of the Indian chiefs, the aristocracy and cultured persons, but so long as these preferred to fill their palaces with flaming Brussels carpet, cheap British furniture, Italian mosaics, French oleographs, Austrian lusters, and German brocades, there was not much hope.

❀

Mr. Chamberlain in South Africa

With more or less justice, Mr. Joseph Chamberlain, British Colonial Secretary, has been regarded in many quarters as an instigator of the Boer war, not only because of the character of his correspondence with President Kruger immediately preceding that conflict, but also because of his attitude regarding the Jameson Raid. Friend and foe, therefore, will note with satisfaction that, instead of directing from London the settlement o the complicated questions in South Afric resulting from the war, Mr. Chamberlai is giving his personal attention to then on the ground itself. He has arrived i Natal, and his visit will include all of th British colonies in that part of the Africa continent. He purposes to confer with th representatives of all the different interest concerned, Boer and British alike. A to the latter, his speeches have alread excited much colonial enthusiasm. On of his critics remarked that, after th extraordinary achievement of inducing th people of Natal to shout themselve hoarse over the privilege of taxing them selves for the payment of millions of wa losses, Mr. Chamberlain ought to be sen from one end of the Empire to the other as the seductive recruiting sergeant anc practical tax-gatherer of the Imperia Federation. At all events, the Colonia Secretary's present undertaking consti tutes a new and personal element in the consolidation of the Empire. It is cer tainly a statesmanlike departure from the routine ruts of administration. It may even result in such a contribution to the growth of imperial feeling in England and in the colonies that a series of official visits to each of the chief groups of British possessions will be undertaken.

❀

The Chinese Indemnity

Wu-Ting-Fang, until a month ago Chinese Minister to the United States, declared long since that his country would be found to be unable to pay in gold the entire amount of the indemnity demanded by the Powers for the Boxer outrages of 1900. When the first payment became due on July 1, 1902, it was offered in silver, which had then somewhat depreciated in value. This payment was accepted under protest by all the foreign Governments concerned. Our own Government, accepting the statement of Minister Wu and having an earnest interest in the preservation of China's integrity and perpetuity as a nation, reserved the right to demand any balance of the installment due if the entire settlement should ultimately be made on a gold basis as agreed. This tolerant attitude gave great comfort to the Chinese—who now offer the second payment in a still more depreciated currency—and propor-

nonate discomfort to the representatives of the other Governments at Peking. They ascribe the present difficulty to the quasi-favor shown by the United States Government to the silver argument. When the treaty arrangement was made, the value in gold of the Chinese tael was nearly seventy-five cents; since then the tael's value has depreciated until it is now worth slightly over sixty cents. To liquidate on a gold basis, therefore, China would be obliged to pay the difference between these figures on every tael, which in the aggregate, according to Minister Wu, would deplete the Government's resources and leave it bankrupt. Yet the Foreign Ministers at Peking apparently insist more stoutly than ever that indemnity payments should be made on a gold basis—that is, in silver at the ratio of gold which existed at the time when the indemnity was fixed. The present loss indicates some idea of the tremendous burden under which any country labors in attempting to do business with foreign nations on the silver standard. The opposition to payments in a depreciated currency may produce, not only an immediately serious internal situation, so far as the actual Chinese Government is concerned, but also a far more difficult international complication in reopening questions which not long since threatened to bring about the partition of China among the Powers. Instead of such a result, The Outlook prefers to think that out of the present imbroglio there may arise a new case to be submitted to the Hague Tribunal of Arbitration.

❀

Anti-Vivisection Bills For some time anti-vivisectionists have been trying to put through Congress certain bills to restrict and largely to prohibit experiments upon living animals in the District of Columbia. These bills, if passed, would undoubtedly have great influence upon the Legislatures of the various States. It happened that a recent surgical operation, which has attracted much public attention, performed successfully upon a midshipman of the Naval Academy, was made possible by discoveries of vivisectionists. The surgeon who performed the operation, Dr. W. W. Keen, of Philadelphia, one of the highest authorities of his profession in this country, wrote to Senator Gallinger, the sponsor of these bills, informing him of this fact. Thereupon Senator Gallinger replied at some length. He greatly weakened his case, however, both by making an unworthy intimation that Dr. Keen was guilty of misrepresentation and was actuated by motives of self-advertisement, and by assuming to write with the authority of a medical expert rather than from the point of view of a public man. Without these defects his argument is that "it is unsafe to reason from the brains of animals to that of man," that experiments upon man based upon such reasoning have been "to a great extent disastrous," that it is uncivilized to ignore the "altruism" of prohibiting experiments upon living animals and to prefer the "selfishness" of using such experiments for the purpose of "helping humanity," and that there is "undoubted testimony" to facts of horrible and malicious cruelty, cases of which he cites.

❀

Dr. Keen's Reply Dr. Keen, in his very dignified but incisive rejoinder, calls attention to the fact that Senator Gallinger took his medical degree many years ago, and since that time there has been a great advance in surgery, of which Mr. Gallinger, occupied by other duties, can have but little knowledge, and informs his opponent that "facts derived from experiments upon animals are applied surgically to the brain of man with greatest exactness," and that he himself had applied such facts scores and scores of times. "Were it not for experiments upon animals," he continues, "medicine would be in the wretched darkness of thirty years ago, and we surgeons would be practicing the unintentional cruelty to man of the surgery of the Civil War." As to the cases of cruelty cited by Mr. Gallinger, Dr. Keen calls attention to the fact that no data are given by which the original statements can be referred to and verified. In closing he renews his protest against the anti-vivisection bills, which, though offered with good intention, would, if passed, be as inhuman as a law "forbidding any person to aid in rescuing a drowning man." In discussions of this kind the scientific opinion of such an expert as Dr. Keen ought to be

final in determining the opinion of the layman, otherwise knowledge would be at the mercy of ignorance. As regards the ethics of the discussion, it is plain that the view which considers the prohibition of experiments upon living animals as "altruism," and the application of such experiments for saving human life as "selfishness," would logically place the veterinary surgeon at the head of the medical profession and would exalt the Brahminical civilization above the Christian. On the legal side, the practice of vivisection, like everything else which concerns physical pain and death, should be carefully guarded from inexpert hands, and should be limited to those who are thoroughly qualified for it by training; but to prohibit it because some surgeons are cruel would be like abolishing law courts and newspapers because some lawyers and editors are immoral. The people have the right to say that it is unwise to allow the practice of vivisection in the public schools—and The Outlook believes that they ought to say so—but they also have the right to profit by discoveries made and physiological laws established as the result of vivisection carried on by scientific men.

❀

For Better Religious Education

A forward movement of great significance "for the improvement of religious and moral education through the Sunday-school and other agencies" has been inaugurated under the auspices of the Council of Seventy directing the American Institute of Sacred Literature at Chicago. For this purpose a National organization is proposed, and a formal call has been issued for a Convention to create it. The Convention will be held at Chicago, February 10–12. It will be remembered that at the International Sunday-School Convention in Denver last June the Lesson Committee reported that the majority of Sunday-schools are so inadequately organized and manned that only the simplest plans of study can be made effective. The call for the Convention states that perhaps twenty-five per cent. of our Sunday-schools have reached a stage of development ready for the introduction of a gradation both of pupils and of the material of instruction. While it is recognized as unwise to attempt to replace the uniform system of the International Lessons, suited as it is to the large majority of Sunday-schools, the immediate need in these, says the call, "is to inspire a higher educational ideal of Biblical, moral, and religious instruction." But it is not intended "to duplicate or rival the work which any organization is now carrying on;" rather, to co-operate closely with the churches, and to supplement and assist the work of the various other organizations. Under present conditions "the greater number of children grow up without correct and adequate religious and moral education." These conditions have for years been recognized with increasing dissatisfaction. Individuals have striven singly and in groups to better them, but there is needed some leadership to unify such efforts. This it is proposed to supply as the scheme is progressively worked out by the directors and committees of the proposed association. Its immediate work will be the creation of an adequate literature of the movement, exhibiting desirable ideals and methods, and beginning a campaign of education on the whole subject. The list of signers to the call includes the names of about a hundred presidents and professors of colleges and seminaries, with a larger number of pastors and others interested in Sunday-schools, including Dr. B. B. Tyler, President of the International Sunday-School Association. Conferences between the leaders of the movement and the signers of the call are being held in some of the larger cities, to prepare for the organization and work of the Convention by preliminary comparison of views, and by securing agreement on the course to be pursued in an uncharted sea. The strength at present apparent in the movement is highly auspicious. The Outlook is in full accord with the belief expressed by the Council of Seventy, that "this movement . . . is a normal, timely, and vital step in the development of our Christian civilization." The time is ripe for the proposed work, and the field is large and open.

❀

The Harput Orphanage

In the annual report of Consul Norton, of Harput, Asiatic Turkey, we find a reference to the Harput Orphanage, conducted

and sustained by American benevolence. Most of our news from Asia Minor comes from the American missionaries there, and is naturally of great interest to the religious world; it is a satisfaction also to chronicle tidings which show how valuable the work of American missionaries, educators, and philanthropists may be in the direction of industry. Speaking of textiles, Mr. Norton says that, although his region produces an excellent grade of cotton, the native manufacture, which, owing to the abundant water-power, should be a large one, is quite the contrary, as it is dependent entirely upon hand-power. The only advance is due to the Harput Orphanage, which has introduced the weaving of attractive patterns to meet the popular taste, and is doing much to enable local industry to compete with English, German, and French looms. As to rug-weaving, the production from the Kurdish looms of the region extends but little beyond local needs, while the rug department of the American orphanage is steadily perfecting its work and turning out products which find a ready sale in the United States. The Harput Orphanage is able to command a dollar per square foot for its rugs, a price much in excess of the average of Oriental make, and this is due largely to the fact that the yarns employed in our orphanage are dyed exclusively with vegetable coloring matter. The increasingly widespread use of the crudely brilliant but fugitive aniline dyes in coloring materials for rug-weaving in Turkey is distinctly deplorable, and has already led to a steady depreciation of their value in the eyes of American and European connoisseurs, when contrasted with the products of Persian and Indian looms.——Another indication of American advance in commercial conditions at Harput is an incidental one. The various edifices of Euphrates College and of the American mission station at Harput were destroyed in the massacres of 1895. In the rebuilding of these structures American steel roofing was used. Its manifest superiority to fragile tile roofs and to the ponderous mud roofs hitherto in vogue throughout the Orient has now been recognized. The city hall at Harput is covered with American roofing, and a large school building now being erected is to have the same protection.

❁

With Lepers in Surinam

The work of Father Damien in Hawaii, of Mary Reed in India, and of other self-devoting spirits elsewhere, has been inaugurated recently in Surinam, South America, among the victims of the living death of leprosy, who there are numbered by hundreds. The Dutch colonial government established an asylum for lepers in 1897, to which every leper found on the streets is consigned. Dreading this as an American dreads the poorhouse, the lepers rarely venture out-of-doors; but intercourse with them in their homes, where they support themselves by the sale of small commodities, is an evil still unrestricted. Near the Government asylum the combined Protestant churches of Surinam established in 1899 a leper settlement possessing the attractiveness of a Christian home and named "Bethesda" (the House of Mercy). Friends in Europe and America have given aid, and a tiny village of little houses, each accommodating two patients in separate rooms, is now full. A young married couple, the Rev. H. T. Weiss and wife, with two deaconesses, Sisters Philippina and Martha, have devoted themselves to this charge, dangerous but divine, and to the naturally repulsive but humane services it requires. Mr. Weiss, a clergyman of the Moravian Church, is now on a visit to this country to solicit aid for the expansion of this good work, still unprovided with some important requisites. His mission is officially indorsed. He will be glad to send his printed story of Bethesda, and all desired information, to any who address him at 225 West Twenty-third Street, New York.

❁

A Correction

A Southern correspondent informs us that the Georgia Legislature still meets annually and that the child labor bill defeated at the recent session will be presented again at the next session in June, with the prospect of commanding greater strength. It is the kind of a bill that grows stronger every time it is "killed."

Tammany Outdone in Minneapolis

The shocking revelations of police complicity with vice have so uniformly exposed conditions in some great metropolis that people in our smaller cities have naturally come to think of their own municipal virtue with a snug and smug complacency unwarranted by the facts, and peculiarly benumbing to the public conscience. It is true that public plunder on a vast scale may more readily be organized in a great city without public knowledge, and that it is more difficult there for a few public-spirited citizens to accomplish its overthrow; but there is no difference whatever in the kind of temptations to which public officials are exposed, and no difference whatever in the need of eternal vigilance on the part of the public to preserve municipal purity. The problem of municipal corruption is the same in Newark as in New York, the same in Harrisburg as in Philadelphia, the same in Minneapolis as in Chicago. This last proposition at least is now indisputable, for Mr. Lincoln Steffens's article on "The Shame of Minneapolis" in the January "McClure's" exposes a brazenness of municipal corruption not equaled in Chicago or even in New York during the past quarter of a century.

In the fall elections of 1900 Dr. Albert Alonzo Ames was nominated as the Republican candidate for Mayor of Minneapolis at the direct primaries. The responsibility for his nomination, therefore, cannot be lifted from the ordinary voter and saddled upon a corrupt political machine. His loose private character was known at the time of his nomination. He came of good Puritan stock. His father—also a physician—was one of the pioneers of Minneapolis, and Dr. Ames himself was a man of great professional skill, who from the first had one supreme virtue of a political leader—genuine kindness toward the poor. But, along with this attractive quality, he was from his young manhood sensuously self-indulgent, and as years advanced this characteristic grew upon him, and he not only made friends of the poor by his generosity, but friends of the corrupt by moral affinity. Entering politics early, he was elected Mayor of Minneapolis as a Republican. Changing his politics, he was at intervals twice elected to the same position as a Democrat, and changing his politics again a few years ago, he was, as stated, nominated in 1900 as a Republican. At the primaries which nominated him voters of either party could vote either ticket without challenge, and Dr. Ames is believed to have received the votes of a great many Democrats who did not take their party allegiance seriously. In the campaign which followed hundreds of Republicans who were disgusted with his nomination acquiesced in his election because it was a Presidential year.

During Dr. Ames's previous administrations he had not been especially venal. "He was a 'spender,' not a 'grafter,'" and his personal dependents seem to have monopolized the spoils which the wide-open city furnished. At the very beginning of his fourth term, however, he set out to organize the licensing of vice for his own enrichment. He made his brother, Colonel Fred W. Ames, a discredited officer from the Philippines, his chief of police. He made Norman W. King, a former gambler, his chief of detectives. The collector for women of the town was to be Irwin A. Gardner, a medical student in Dr. Ames's office, who was made a special policeman for the purpose. "These men looked over the force, selected those men who could be trusted, charged them a price for their retention, and marked for dismissal 107 men out of 225, the 107 being the best policemen in the department from the point of view of the citizens who afterwards reorganized the force." The carnival of corruption which followed is vividly depicted by Mr. Steffens, and a few of his strong lines will indicate the character of the picture:

> The administration opened with the revolution in the police force. They liberated the thieves in the local jail, and made known to the Under World generally that "things were doing" in Minneapolis. The incoming swindlers reported to King or his staff for instructions and went to work, turning the "swag" over to the detectives in charge. Gambling went on openly and disorderly houses multiplied under the fostering care of Gardner, the medical student. . . . [Even before this] disorderly houses were practically licensed by the city, the women appearing before the clerk of the Municipal Court each month to pay a "fine" of

$100. Unable at first to get this "graft," Ames's man Gardner persuaded women to start houses, apartments, and, of all things, candy-stores, which sold sweets to children and tobacco to the "lumber Jacks" in front, while a nefarious traffic was carried on in the rear. But they paid Ames, not the city. . . . But the money still paid direct to the city in fines, some $35,000 a year, fretted the Mayor, and at last he reached for it. He came out with a declaration, in his old character as friend of the oppressed, that $100 a month was too much for these women to pay. They should be required to pay the city fine only once in two months. This puzzled the town till it became generally known that Gardner collected the other month for the Mayor.

"In a general way," says Mr. Steffens, "all this business was known. It did not arouse citizens, but it did attract criminals, and more and more thieves and swindlers came hurrying to Minneapolis." When the whole orgy of profit-sharing with crime was finally exposed, it was shown that detectives were stationed at the doors of gambling-houses which swindled their clients, for the express purpose of scaring the victims if they threatened to complain, and, if possible, running them out of town in fear that they would be prosecuted. If the victims insisted upon taking their complaints to the Chief of Police, the Mayor's brother would first try to wear them out with long delays and then he too would attempt to browbeat them into silence. What this policy yielded to the administration is graphically presented to the eye by photographic excerpts from the ledger of one of the swindling concerns. The first entry in this ledger ran as follows:

ACCOUNTS NOVEMBER 18 TO 25

[*Expenditures.*]		[*Receipts.*]	
Nov. 18. Mayor Ames....	$500.00	Monday.....	$533.00
Gardner.....	50.00	Tuesday.....	269.00
[Detective] Norbeck	50.00	Wednesday..	622.00
Chief Ames.....	20.00	Thursday....	575.00
Wood.....	1.00	Friday	321.00
Kerosene Oil....	.25	Saturday....	352.00
Orrin.....	25.00	Sunday.....	45.00
Nut of Joint.....	$646.25		$2,718.00
		45% Steerers Bid.....	$1,123.10
		Bal. Joint...	$1,494.90
			$646.25
		Bal. to Crd...	$848.65

Some members of the police force did not stop at direct participation in robberies, one police captain having stood guard while a safe was robbed by confederates.

The final breakdown of the conspiracy came from dissensions within. As plunder increased greed increased, different conspirators began to rob one another, and the whole situation became chaotic. The conspirators held together well enough to secure the dismissal from office of a county sheriff who attempted to restrain their excesses, but soon the honor necessary to successful thievery failed, and the different conspirators failed to protect one another's protégés. At this juncture a grand jury was drawn in the ordinary way, one of whose members, Hovey C. Clarke, was a man of extraordinary force of character. Mr. Clarke was made foreman of the jury, and, finding that some of his associates would support him, he determined to overthrow the whole syndicate of corruptionists in control of the city. The determined jurors went to the jail and saw two bunco-steerers who had not received the expected protection and were nursing their grievances against the officials who had failed them. One of these men afterwards stated that he was persuaded to turn State's evidence because he "sized up" Clarke as a man who was bound to keep up his fight till he won. "We," he said, meaning criminals generally, "are always stacking up against juries and lawyers who want us to holler. We don't because we see they are quitters. They can be pulled off." Clarke and his associates could not be "pulled off," though Clarke was offered $28,000 to quit, and his life seemed to be in danger from the wrath of the criminal elements. "What startled the jury most, however," says Mr. Steffens, "was the character of the citizens who were sent to dissuade them from their course. No reform I have studied has failed to bring out this phenomenon of virtuous cowardice." In three weeks the jury was able, by means of hard personal work and heavy personal expenditures, to collect enough evidence to bring in indictments, and, with some difficulty, the assistant public prosecutor was persuaded to institute proceedings. The Grand Jury paid the cost of bringing witnesses from as far as Idaho. First Gardner was tried and convicted, then Captain Norbeck of the detectives, then Fred Ames, and then Chief of Detectives King. As conviction followed conviction and one piece of evidence supplemented another, a panic spread among the conspirators. Among those who fled were two heads of departments against

whom nothing had been shown or discovered until their flight revealed another source of "graft" in the sale of supplies to public institutions, and the diversion of provisions to the private residences of officials. Mayor Ames, under indictment and heavy bonds, fled from the State on a night train. By this time it was evident that the side of the prosecution was the side of victory, and men who had feared to act before were now eager to take part in driving out the last vestiges of the overthrown régime. In a few months a decent government was established, and Minneapolis had an unforgetable lesson not only in the appalling possibilities of municipal corruption at the hands of a few public plunderers, but in the inspiring possibilities of municipal regeneration at the hands of a few determined men of dauntless public spirit.

Mr. Steffens's stirring story should be read everywhere, for it strikes at the very heart of both of the twin stupidities which dull the conscience of American municipalities—the optimism which says that all is so good that nothing need be done, and the pessimism which says that all is so bad that nothing can be done.

❀

The Practical Test

What shall a Christian believer say to one who apparently denies the very foundation of Christian faith by altogether denying the existence of spirit; who insists that only matter and force exist, that there is but one kind of force, that the difference between the force generated by an electric battery and that generated by the brain of a Shakespeare is a difference only in quality and result, not in essence, that as the electric power ceases when the battery decays, so the mental power ceases when the brain decays, that as there can be no music without an instrument, so there can be no spiritual life except as it is connected with and produced by the body? This question in various forms is often asked—has been often asked of The Outlook.

The reply to this question is to be found in the principle that the test of any theory, whether in philosophy or in science, is simply this: Can the theory be practically applied in the conduct of life? This test is thus stated by Professor James in "The Varieties of Religious Experience." After quoting at some length from Sir Henry Maudsley, one of the ablest representatives of materialistic philosophy, he adds: "In other words, not its origin, but *the way in which it works on the whole*, is Dr. Maudsley's final test of a belief. This is our own empirical criterion; and this criterion the stoutest insisters on supernatural origin have also been forced to use in the end." The italics are those of Professor James. Using this test, how does the theory that mental force and physical force are identical work when applied to the conduct of life?

There are in philosophy two contrasted skeptical theories: one, that there is no matter, all is mind; the other, that there is no mind, all is matter. It is not easy to refute either by pure reason; but neither works well in actual life. How do we know that matter exists? We see it and touch it? But this only means that certain sensations take place in us which we attribute to external causes. How do we know that they are due to external causes? How do we know that we are not dreaming, that matter is anything more than a phantasmagoria, a succession of mental images, a series of pure imaginings? How does the materialist know that there is an electric battery? How does he know that there is a brain? The answer is that we have to live as though matter existed. This is the practical answer, and it is all-sufficient. If I think I am cold, the coldness may be only a "mortal thought;" but I shall continue to think cold, until I can think coal and put it on what I think is a fire. The answer, and the only answer, so far as we can see, to pure idealism is that it does not work well; whether matter exists or not, we have to act as though it exists.

Similarly, How do we know that mind exists? We reason, feel, resolve; but how do we know that reasoning, feeling, resolving, are anything more than a phase of physical energy, a more subtle form of electricity, a material force generated by the brain? How do we know but that the statement of one of the older materialists is true, and that "the brain secretes thought as the liver secretes bile"? The

answer to this question is the same as the answer to the other. The theory of materialism does not work well. We cannot apply it to the conduct of life. As we have to act as though there were matter, so also we have to act as though there were mind. Physical forces are not subject to moral judgments; we do not condemn gravitation as guilty of wrong-doing. Spiritual forces are subject to moral judgments; we do condemn spiritual forces as guilty of wrong-doing. If a paper-weight falls off the desk and hits you on the knee, you do not think the desk, paper-weight, or gravitation deserving of condemnation; if a man throws a stone and hits you on the knee, you do think the man worthy of condemnation. Society could not go on except upon the assumption that man is a free moral agent; that his acts are not the necessary sequence of purely physical conditions; that he deserves praise for some actions and blame for others. Except on this assumption there could be neither government nor public opinion, neither good morals nor good manners. Civilization is based on the hypothesis that matter exists; it could not go on upon any other hypothesis. Society is based upon the hypothesis that mind exists; it could not go on upon any other hypothesis. So long as a man acts as though there were matter, and as though there were mind, society does not care what theories he broods in his study. But when a man acts as though matter had no real existence, we call him crazy. If he attempts to put his theories into practice, he is liable to be sent to the insane asylum. If he acts as though mind did not exist, and ignores all moral responsibility for his action, we call him immoral, and he is liable to be sent to the penitentiary. Neither pure idealism nor pure materialism works. Life repudiates them both.

We do not think there is much use in arguing with either the idealistic skeptic or the materialistic skeptic. We never knew of much progress made in such argument. It is best to let him play with his pet doll before the study fire as much as he likes. It is certainly not a living child, and cannot go out by itself and enter into the tussles of actual life. To the idealistic skeptic we should simply say, Whether there is matter or not, you would better act as though matter is real, or you will very soon come to grief. To the materialistic skeptic we should say, If it be true that the brain secretes thought as the liver secretes bile, you would better see to it that your brain secretes the right kind of thought if you wish to enjoy the esteem of your fellow-men. If what we call the life of the soul is inseparably bound up with the body, and ends when the body ends, still let us make that life high, pure, true, noble. Religion is *life;* and to all philosophical skepticism, whether of the pure idealist or the pure materialist, our reply would be, Let us *live* as though life were real, life were earnest. It is not by the theories which we brood in our studies that we are to be tested, but by the life we live in the world of men.

❀

The Gifts of Millionaires

The daily papers report simultaneously two addresses, one by John A. Hobson, the English economist, delivered in Philadelphia, the other by Professor John Bascom, of Williams College, delivered in Chicago. Both, if they are correctly reported, maintain as a principle that educational, philanthropic, and religious institutions should refuse to receive gifts from donors whose money, in the judgment of the trustees, or perhaps we should say in the judgment of the general public, has been obtained by unrighteous methods. We quote from the newspaper reports a few sentences to indicate the principle implied or affirmed. Thus, from the report of Mr. Hobson's address: "Is society to be saved by the millionaires? The fact that they give us great gifts should not keep us from tracing the origin of their wealth. . . . Is it safe to take money so gained [*i.e.*, by unrighteous methods] and spend it for public purposes at the wish of the millionaire?" The answer that Mr. Hobson evidently expects to this question Professor Bascom gives: "John D. Rockefeller's dollars have sealed the lips of every instructor at the University of Chicago. . . . In the East it is considered necessary to teach political economy and sociology in any large institution of learning. How are professors at the Chicago University to do this? They have accepted this man's

money, and in fairness to him and themselves they must not tell the young men and women who come to their school how their benefactor gained his dollars. . . . There are men at this university who are being prepared to fill pulpits and teach the law of God. They should know of the business immorality which exists. Can they be taught that at the University of Chicago? Dr. Harper can say nothing uncomplimentary about the manner in which Rockefeller gained his dollars. He would cease to be a gentleman if he did."

Whether these reports accurately represent Mr. Hobson and Professor Bascom it is not important for us to determine. They represent accurately enough for our purpose a principle which is specious but, we believe, thoroughly unsound: the principle enunciated in the report of Mr. Hobson's address, namely, that it is the duty of those to whom wealth is offered for use in public service to trace the origin of the wealth, and to decline it if, in their opinion, it has been acquired by unrighteous methods. In our judgment, the trustees of religious, philanthropic, and educational institutions have no such duty; and no such consequences result from a failure to perform this impracticable task as is more than intimated in the report of Professor Bascom's address.

Before such a principle is accepted it must be thought out to its logical consequences. If the trustees of a hospital or college or church are to trace to its origin wealth offered for the public service, and to refuse such wealth as in their judgment has been unrighteously acquired, they must first of all establish a standard of business morality by which to test the commercial transactions of the proposed benefactor. The prohibitionist trustee who holds that it is wrong to make money by selling beer will refuse Matthew Vassar's money for the founding of Vassar College. A more radical temperance companion will refuse money from the hop-grower, because hops are used chiefly for beer. The Sabbatarian will vote against receiving money from a railroad millionaire if the railroad has been operated on Sunday. The vegetarian will decline money from Mr. Armour, because it is wrong to destroy animal life for food. Mr. Hobson classed Mr. Carnegie and Mr. Rockefeller together; Professor Bascom is reported as saying that "it would be all right to accept Mr. Carnegie's money," but all wrong to accept Mr. Rockefeller's. Who shall decide? Are the board of trustees by a majority vote to settle a standard of ethics by which past business transactions are to be judged? And when they have decided upon a standard, how shall they decide as to the transactions? Are they to constitute themselves into a court to investigate the method by which Mr. Carnegie made the wealth offered to the library, and Mr. Rockefeller the money offered to the university, and Mr. Vanderbilt the money offered to the hospital, and Mr. Drexel the money offered to the institute? They cannot presume a man guilty because he is wealthy. Surely they cannot condemn him without investigation on common report. If they are to condemn him at all, they must give him a hearing in his own defense. This would be a curious result: that whenever money is offered to a board of trustees they must, before accepting it, put the donor on trial to see whether he acquired it righteously or not. And yet this is what they must do, if it is their duty to trace wealth to its origin before accepting it for public uses. And the inquisition must be a discriminating one. They must determine what proportion of the wealth has been acquired by righteous and what proportion by unrighteous methods. Does any unrighteousness vitiate the whole? Then there can be very few donations received. If not, what proportion of unrighteousness is required to make rejection of the donation a public duty?

It is quite impracticable for trustees to undertake any such inquisitorial function as this principle would lay upon them; but if they were able to perform it, and in the performance of it found that all the money was acquired by methods wholly immoral, this would of itself constitute no adequate reason for refusing to accept the money in trust for the public. Let us suppose the clearest of cases. A man has made his money as a professional gambler. Now that he has it, he desires to give it to the public. What better use can he put it to? He cannot ordinarily search out the men whose money he has won and return it to them. If he converts it into

government notes and bonds, and burns them up, he gives it to the Government. If he leaves it to his children, is it more moral for them to take it for personal uses than for a board of trustees to take it for public uses? Was Christ wrong when he suffered the woman that was a sinner to anoint his feet with ointment which it is quite certain she had bought with the wages of her sin? Ordinarily the best thing a sinner can do with his ill-earned wealth is to give it to the community; the fact that it is ill earned is no reason why it should not be devoted to the public service. It is rather an added reason why it should be so devoted. We are not here concerned with the question whether Mr. Rockfeller and Mr. Carnegie have earned their wealth by righteous or unrighteous methods, or part of it by righteous and part of it by unrighteous methods. We simply affirm that, first, it is not the business of boards of trustees to determine whether wealth offered for public use has been righteously or unrighteously earned; and, second, if it has been earned by unrighteous methods, the best thing that the owner can do with it is to give it to the public, save in the very rare cases in which it is practicable to return it to the original owners.

The supposed principle that trustees should trace to its source wealth which they receive for public uses rests on the false presumption that if wealth acquired by unrighteous means is accepted for public use it cannot be freely used for the public by those who have accepted it. The report before us does not indicate that Professor Bascom gave any reasons for believing as matter of fact that the lips of the professors in the Chicago University, or those of the graduates of its theological school, are sealed. Apparently this conclusion is based, not upon any evidence that the first do not teach and the second do not preach freely, but upon the assumption that they cannot honorably do so. In truth, they cannot honorably do anything else. It is not, indeed, the function of a professor of economics, whether in the Chicago University or in Williams College, to decide and teach whether Mr. Rockefeller personally made his money by ethical or unethical methods; that is a question for the courts of justice. But in so far as those methods are matters of public history, they are as proper subjects for economic and ethical teaching in Chicago University as in Williams College. The graduate of Chicago Theological Seminary is morally as free to condemn dishonest and despotic methods in business as the graduate of Union or of Princeton, and is as much under obligation to do so. There is no condition implied in the acceptance of an unconditioned gift for public uses except that it shall be used for the public by the institution to which it is given. If a liquor-dealer desires to take a high-priced pew in a church, shall the trustees refuse to rent it to him lest the minister be afraid to preach on temperance? This would be to insult the minister. If a railroad desires to advertise in a newspaper, shall the manager refuse to take the advertisement lest the editor fear to demand governmental regulation of railroads? This would be to insult the editor. A professor who should refuse to condemn the violation of economic and ethical laws because some patron of the university is publicly reported to have violated those laws would be grossly unfit for his chair. A preacher who should refuse to condemn dishonesties in business because some of his pewholders are reported to be guilty of such dishonesties ought to be drummed out of the pulpit to the tune of the rogue's march. We do not believe that there is any such cowardice in the pulpits and the professors' chairs as the report of Professor Bascom's address implies. But in so far as there is any such cowardice, the remedy is not to be found in laying upon boards of trustees the wholly impracticable task of tracing wealth to its source for the purpose of ascertaining how far it has been righteously accumulated, but in inspiring the hearts of teachers, preachers, and editors —and the editors need it quite as much as the teachers and preachers—with a loyalty to truth and a courage of conviction which will make them never consider the question where the money comes from which endows their chairs, furnishes their pew-rents, or supplies the pecuniary resources of their journals.

If property is offered to a board of trustees which does not belong to the donor and which can be returned to its lawful owner, they are not to accept it;

not because it was unlawfully acquired, but because it is unlawfully retained. If conditions are attached to the gift inconsistent with its free use in the sense to which it is nominally dedicated, it is to be promptly declined. If there is a reasonable suspicion that conditions exist in the mind of the donor which are not expressed, there may be occasions on which it would be legitimate for the board of trustees to avoid misunderstanding by some explicit statement. But it is not their function to trace proffered endowments to their source, nor to put the donor on trial, still less to condemn him on public report without a hearing. They will not raise the ethical standards in the community, nor in the institution under their charge, by imputing unworthy motives to a benefaction apparently worthy in itself, nor by attaching on suspicion dishonorable conditions to a gift which is in its terms free from conditions. On the contrary, they will best serve the highest ethical ends by assuming, in the absence of evidence to the contrary, that all gifts are intrusted to them to use for the public benefit in accordance with their trust and with no other obligations than that trust implies, and by taking it for granted, if they are the trustees of an educational institution, that the teachers will be loyal to their own consciences and to the truth, without regard to the sources, real or supposed, from which the endowment of the institution is derived.

The Impressions of a Careless Traveler

IV.

March 30.

THE event of to-day was going to church. The only Sunday service which the Prinzessin arranges for the passengers is an early matin; we are awakened on Sunday morning by the band playing "Eine Feste Burg." That ends the religious services for the day, which then goes on exactly as do other days, except that the passengers do not get out shuffleboard and ring-toss, nor do I see the cards out in the smoking-room on Sunday evening. The first Sunday out, a service was announced, but it had to be abandoned; the weather was prohibitive. The second Sunday there was a simple service in the Social Hall; but as half the passengers were German and could not understand English, and half were American and could not understand German, and there were neither prayer-books nor hymn-books on board, the service limped. I think the Hamburg-American line, which seems to spare no expense in providing comforts and even luxuries for its passengers, might well recognize the fact that there are a goodly number of ocean travelers who enjoy a Sunday service, and might provide service-books so that passengers could arrange for a service if they wished to do so. The Directors may not care for Sunday services themselves, but then I do not suppose they all play shuffleboard and ring-toss, yet the material is provided for those who do. We all drove over to Nice and then separated. B—— and H——started for the Roman Catholic Cathedral on account of the music of Easter Sunday, found it too crowded, and finally went to a Russo-Greek church. The Matron and I went to the English Church, where the service began with the Lord's Prayer—the Invitation to Prayer, the General Confession, and the Absolution being omitted. I wonder why. Is Absolution taken for granted on Easter Sunday? Being a Puritan, to me all Sundays are Easter Sundays. After service we met and took our luncheon at a café-confectionery-baker-restaurant combination, where a delicious meal was served to us at a cost, including the tip to the waiter, of $2.11—that is, fifty-three cents apiece. The French do understand the art of giving delicious meals at small prices—an art not yet acquired in America, where "cheap and nasty" are terms almost inseparably connected in restaurants.

Then we took a carriage and drove over the hills to Villefranche. By the shore road the distance is about five miles; by the Cornichi road, which we took, the drive was at least double that distance. We climbed a thousand or twelve hundred feet by one zigzag road to the top of a

hill, and drove down a thousand or twelve hundred feet by another zigzag to our landing-stage. B—— engaged in conversation with our driver, asking him all manner of questions, at our suggestion, as to places, trees, fruits, flowers, etc., and he stopped and gathered some olives that hung over the road and gave them to the ladies of our party. B——'s knowledge of French is but slight, and she laughed over her own linguistic blunders; but the driver was immensely pleased at being taken, as it were, into our party; he gave us a most cordial "Bon voyage" when we left him, and even when our rowboat was a considerable distance from the landing-stage we could see him standing up in his carriage and waving his hat in adieus to us. As I am making this entry I hear the Cook party coming on board after their excursion to Nice and Monte Carlo. In half an hour we weigh anchor and set sail—except that we have no sails—for Palermo.

April 1.

Palermo is the first natural harbor we have seen since we left New York, and Palermo would not be a very safe harbor were its natural protection not improved by great breakwaters. At Madeira, Gibraltar, and Villefranche we anchored in what were practically open roadsteads, and the harbor at Genoa was almost wholly artificial. We are attached by hawsers to a wharf at one side of the harbor, but five or ten feet from the shore, and are carried a mile or a mile and a half in small boats to a landing on the other side of the harbor—why, I do not know. I am told that on her first excursion the Prinzessin undertook to land her passengers in her own steam launch and lifeboats, but met with so much opposition from the local boatmen that she abandoned the attempt in the Mediterranean Sea, and left the local boatmen to carry the passengers to and from shore. I am glad of it. Their income must be poor and uncertain at the best; and it is worth the quarter of a dollar to be greeted by them with smiles and not with curses. Before leaving New York I had looked up Palermo and laid out a day's excursion. It perhaps confirms the practical wisdom of the selection for the day that I hit upon the same route which Cook's agent had laid out for his party; but the result was that we met them wherever we went. In our tour about the city we were half the time in the Cook procession; we came into the church or the palace to find them there, or they came in to find us there, as the case might be; in short, we were, in spite of ourselves, Cookies, as H—— irreverently calls them. On one or two occasions I had to explain to the doorkeepers as best I could—not knowing Italian—that I did not belong with them, and had my own separate fee to pay for our party. I may record here the fact that I have kept a careful cash account of the expenses of our shore excursions at Madeira, Gibraltar, Genoa, Nice, Monte Carlo, and Palermo, and find that we have had substantially what Cook has given to his parties, and have paid about ten per cent. less. Ten per cent. seems to me a small sum to pay Cook for taking off from one all the care and worry of a shore excursion—that is, from those to whom it is a care and worry.

I am sorry to have had only a day and a half at Palermo; I should like to stay here for a month. The busy harbor, full of small craft, the opportunities for boating, the environing hills—grass-covered to their summit where they are not absolutely precipitous; the curious life in the streets, with something at every turn to attract the eye—peasant costumes, pannier-laden donkeys, donkey-carts carrying six or eight passengers, with one small patient donkey tugging at the load, the attractive shops, the countrymen with their rural wares; the abundant flowers and fruits, especially the orange-trees laden with oranges rich in color, fragrant, appetizing; the soft climate, soft but not enervating; the warm, cool air (contradiction, but a harmony in reality) which caresses and at the same time invigorates; the excellent hotels, if I may judge from my experience last evening in one of them where we took dinner with a friend who is staying here; the many excursions in the vicinity from half a day to two or three days in extent, all combine to make Palermo seem like an ideal resting-place. The ride along the seashore, the public gardens, where the gardener was so taken with the Matron's interest in certain flowers that he made her up a bouquet and presented it to her; the Palazzo Reale, with its chapel, in beauty second only to

the Sainte Chapelle in Paris; the ruined cloisters overgrown with vines and wild flowers; the uninteresting cathedral—it is enough merely to catalogue these here; if I ever wish to recall them, Baedeker will do the rest. A funny experience at luncheon illustrated the disadvantage of not knowing the language of the country. When luncheon was over, I called for my bill. As the courteous waiter started off, B—— surmised from my extemporized French that he was really going for a glass of beer! But the waiter never smiled when the error was explained to him. I cannot say as much for the self-restraint of the others of our party.

The most interesting object in Palermo —was not in Palermo at all. It is the monastery and church at Monreale, a mountain or rather hill perhaps a thousand feet above the sea, and a few miles back from the harbor of Palermo. This monastery and church covers the summit of the hill, and round it clusters a poor little village, all of whose inhabitants, I should say, could be put into the church at any one service, and then twice as many more without overcrowding it. The most striking feature of this church is furnished by the mosaics, which afford a striking illustration of the incongruous literalism of Scripture interpretations which prevailed in the Middle Ages. These mosaics are intended to give to the worshipers scenes from both Old Testament and New Testament history. Here is Noah's carpenter sawing the boards for the ark with what is very like a modern saw; here Jacob's angels are seen descending a very short ladder—one wonders why they did not jump, they certainly would not have required their wings—while the Father looks down upon them and upon the sleeping Jacob through an open window. I suppose they are very beautiful; they are certainly very wonderful; but they are not at all credible. It is difficult for a radical Protestant like myself to get, and almost impossible for him to keep, the point of view of a mediæval Christian. Why was this church built here on this hill-top? Why did these monks gather in this monastery to do nothing all day long but say their prayers, walk in these cloisters, cultivate the fruits and flowers in this garden, which, I suppose, in those times few but themselves were permitted to see, and look off over those ramparts at the wonderful view—the ravine below inclosed by mountain walls tapestried with grass and flowers, the plain beyond rich with grass and fruits, still further the city, the murmur of whose ceaseless industry they could easily imagine if they could not hear, and yet beyond the city the sea with its boundless horizon and its treasures of infinite life—all these uniting to call them to come out from imprisonment and idleness to liberty and toil—the sea calling them to life and liberty, the city and the plain to profitable industry, the fruits and the flowers to the glad enjoyment of the good Father's gifts the mountains to the worship of God in the temple not made with hands. How could they look unmoved upon all this and go back to their bare cells and their vacant life and their routine of ritual? I suppose this is inexplicable to a Protestant, because Protestantism instinctively measures the instruments of religion by their capacity to benefit man, mediæval religion by their capacity to express reverence to God. The Puritans' church was a "meeting-house" constructed and employed for the instruction of an audience; the mediæval cathedral was a monument reared as a memorial to the Almighty. The motive of the former might have been *Ad beneficium humanitatis;* the motive of the latter was *Ad gloriam Dei.* The cathedral was no more built to benefit the worshipers who gathered under its roof than the monument in the cemetery is built for the benefit of the one whose body lies beneath it. This church was put on the hill where all might see the glorious monument which reverence had reared to God, and the monks offered their orisons as a tribute to their King. That the best way to render acceptable service to God is by rendering useful service to his children probably never entered their heads. Something such were the thoughts which came to me as I sat there in the church and afterward walked in the cloisters at Monreale. Perhaps we Puritans have reacted too far from the sacerdotalism of mediævalism and need to retrace our steps. Perhaps there is something in this monumental piety which we need to incorporate in our humanitarian religion. I must think more of this. L. A.

The Mosely Commission

A Study of American Workmen by British Workmen

By George Lynch

Special Correspondent of the London "Daily Express," Author of "The War of the Civilizations," "Impressions of a War Correspondent," etc.

THE tour of inquiry into industrial methods and conditions in the United States which has just been concluded by twenty-three of the members of Mr. Mosely's Commission has been very interesting. In England we had been feeling the effects of New World competition in many ways—tobacco and beef trust ways, tube ways, bridge-building ways, ocean ways; in every branch of commerce the competition of the United States was being felt. In the great world struggle for trade we are hard pressed, if we are not, as you say here, beaten back into second place, and a bad second at that. The facts were well worth ascertaining. The elephantine aid of a Parliamentary commission might be instinctively sought by Britishers, but the importance of the subject asked for something more practical, immediate, and businesslike. So thought Mr. Mosely as he paced the paths of his old-fashioned fruit and flower garden, one of the most beautiful in England, punctuating his walks by prodding with the point of his stick at his enemies the wasps, who were feeding on his luscious peaches and nectarines that embroidered with fruit-beads the sunny walls. He had made his money in diamond dealing in Kimberley—had made enough and had enough to spare for doing something in the world, when occasion should offer. He saw opportunity when war broke out in South Africa. He erected a hospital in Natal, equipped it, and presented it through Princess Christian to the British forces in the field. There are various opinions about these South African Uitlanders who have made their pile out of diamond or gold mines, but some of them, like Beit and Mosely, have commanded admiration by their philanthropic generosity. The Jews are not a fighting race; if they do not shed their blood, it is nice to see them shed their gold for the service of the country under whose flag they have made it. Mosely having made it under our flag, with the keen business instinct of his race, did his part in the commercial struggle as he did before in the blood-spilling struggle. He brought a hospital to the wounded in war—he now sends a commission to the strugglers in the commercial fight. There was a considerable amount of difficulty in deciding as to who would be the best to constitute the commission. He eventually settled on asking twenty-three secretaries of the leading trades-unions. There were many advantages about asking the secretaries of the unions. If a selection had to be made from among the ordinary members, there might have been a certain amount of invidious feeling among their fellows in the giving of them a free trip to America with all expenses paid for about three months. Then, on the return of the commission, the secretaries of the various unions are in a better position than any one else to impart the results, and communicate throughout their unions the conclusions they have arrived at.

I must say I was greatly struck, coming over on the steamer, with the broadmindedness of the members I traveled with. I was prepared to find them rather predisposed in favor of British methods and hidebound with insular prejudice, but, on the contrary, found them approaching the task before them with absolutely open minds. They seemed prepared to look at everything impartially, and prepared to learn all that was possible in the time. Mr. Mosely and the delegates made a circular tour, in which they were afforded every opportunity for visiting and inspecting some of the largest manufactories in the United States. Starting from New York, they visited the American Locomotive Works at Schenectady, the works of the General Electric Company, and the power-house at Niagara; they were the guests of the Industries Federation at Buffalo, saw the iron and steel works at Cleveland, the packing-houses in Chicago, the Carn-

Steel Works at Pittsburg, the Cramp Works and the Baldwin Locomotive Works at Philadelphia, the Patent Office and the President at Washington. It may be thought surprising that the owners of these various works were willing to show them to this body of inquisitive strangers, yet in only one instance was permission refused to inspect a factory. If a similar body of Americans had gone on a like quest through Great Britain or the Continent, I don't think everything would have been thrown open to them as it was done here. It speaks volumes for the supreme confidence of the Americans in themselves that they took the attitude expressed by one of them to me in the words, "See all you like and welcome, and beat us if you can."

Each delegate had been supplied by Mr. Mosely with a list of questions to be answered, which form an excellent guide for their investigations. The delegates showed great diligence and industry at their task; they worked hard and compiled voluminous note-books recording their observations, and so much were the note-books in evidence that at one factory—the Carnegie Steel Works, I think it was—those who were conducting them around "kicked," and the note-books had to be shut up. The questions the delegates had to study were divided into: (*a*) Early training of the workers; (*b*) General condition of workers outside the factory; (*c*) Relations between employers and employed; (*d*) General questions which relate mainly to the working of the Civic Federation of the United States, and the desirability of establishing such an organization in England. Many of the questions are beset with difficulty, while the answers to others stand out with obvious clearness, and a month in the country would give the answer as well as a year. This applies to many of the questions under section (*b*); for instance, take question 32: "Is the American workingman more sober than the British?" Without going into the question of actual sobriety, it is unquestionably clear that the American drinks less than the British workman. In some factories visited by delegates in the course of their circular tour, beer or spirits are absolutely forbidden up to the conclusion of working hours; where that rule is not put in force, men very seldom drink beer at their midday meal. Coffee is the usual beverage. Then I have spoken to numbers of employers on the subject of men being late at work on Monday mornings, as is so much the case in towns like Northampton, England, where there is practically no work done on Mondays, and even on Tuesday morning the men do not appear to have recovered from the effects of the holiday. Such a thing would not be tolerated in the States; the regulations appear everywhere the same—a strict record is kept, wages are docked if men are late, but that does not mean that they are allowed to make a practice of coming late. This is not tolerated. A repetition of these offenses and dismissal follows. "We won't keep men who drink or who come late as the result of it—that's all there is to it," were the words of one of them. When we come to look at statistics, we find that what has been impressed and borne in on us so forcibly by what must necessarily be rather cursory observation is borne out by figures. The British workman drinks just twice as much as the American. Per head of the population the consumption is as follows:

	United Kingdom. English Gallons.	United States. English Gallons.
Beer	30.60	12.60
Spirits	1.00	.93.
Wine	.39	.28
Absolute Alcohol	2.08	1.00

I have taken the alcoholic strength of wine at 15 for both countries, and the strength of beer at 4 for the United States and 5 for the United Kingdom. Represented in money, we spend annually more on drink than in the United States—£58,500,000 more on beer alone.

"I guess you put a brake on your progress with your beer," was a remark I heard the other day. Several large employers I spoke to were emphatic in their opinion that beer was bad to work on. They think that it is heavy and acts as a sedative; dulls rather than stimulates. One would think that to the bracing air of this country it would be even more suitable than in England. One often speculates whether a sedative would not be of advantage to some of these feverish workers, especially in New York, this "City of Unrest." Whatever difference of opinion there may be regarding answers to some of the other questions, there can be none to this, as to whether the American or

British workman drinks the most. We are not concerned here with what might be done with the sixty-six millions if we were to reduce our drink bill to that of the Americans, which would enable us, for instance, to establish a fund for old-age pensions, together with paying off the national debt in about eighteen years; but in the comparison of the working power of these two competitors we are concerned in considering whether the one, as the American put it, is not handicapping himself, or putting a brake on his progress, with this load of beer.

One of the points on which the delegates of the Mosely Commission are unanimous is as to the advisability of our having an organization established in England similar to the Civic Federation, and they will recommend the various unions they represent to take steps to carry out that object. There are few of the other forty-one questions set for them to answer on which they will all agree; there are some that it will be almost impossible to answer. "Is it true that the average life of the American workman is shorter than that of the English workman?" Connected with this question there are others, as to whether the American does a larger amount of work in early manhood, but deteriorates young, thus shortening his working years, and is thrown out of work at an early age. To get at the facts regarding the average life of the workman here, I consulted some of the actuaries of the leading life insurance offices, among others Mr. Emory McClintock, of the Mutual Life Insurance Company of New York. He very kindly placed all the available figures at my disposal, but admitted that there were none which would exactly answer my question. An investigation is now being made by a number of insurance offices acting together, in which the various trades and occupations are being classified, but the results will not be totaled up until next June. If this were published, it would be a help to answering the question accurately, but at present a final answer is not obtainable. The opinion of an authority such as Mr. McClintock should carry weight, however. He is clearly and emphatically of opinion that the average American workman lives longer than the English, and in this he was supported by the others I spoke to on the subject. Similarly accurate or conclusive answers can hardly be obtained on the other questions as to whether the American is thrown out of employment at an earlier age. There is perhaps even a still greater objection on the part of American employers to take on men advanced in years than there is in England.

At the same time observant visitors here, not excluding these Mosely delegates, fail to recognize the fact that many of the men engaged in arduous employments after a few years take up other employments less arduous. The puddlers of Pittsburg, for instance, never remain long at their very highly paid but extremely severe work. After from three to five years of it they go off with their savings to a more easy occupation, and thus the impression is given that the men get superannuated at an early period. From the lowest to the highest, men change their occupations with more facility here than in England. The workingmen who strain their vitality to the utmost at high pressure at highly paid employments frequently retire to the cultivation of a small farm, or to occupations in which their acquired skill is applied to making some labor-saving machine do the hard work for them. How often during this pilgrimage have I heard the delegates say that the men do not really work harder here than in England! Here they are often human attachments to machines; they press the button, the machine does the rest; they have just to see that the well-lubricated machine does the work smoothly, without stop or blunder or hitch. In many cases, instead of being the human handle of the machine, they would in England have been the working parts; the wear and tear would have come more directly on their muscles and nerves.

There was a considerable amount of difference of opinion among the delegates of the various unions as to the amount that was to be learned in America in their respective trades. The men connected with ship-building saw nothing to learn here, and went away satisfied with the superiority of the English ship-building yards. The representative of the bricklayers said that the American bricklayer laid more bricks in a given time, but that the American style of work would not be tolerated in England. The walls are so thin

that they would be condemned as unsafe in England, and the bricks are laid parallel to each other with mortar between instead of being locked together as in England. British architects insist that they must overlap in every layer. The flimsier work of the American naturally does not take as much time. English employers could not expect us, it was pointed out, to get an equal amount done when the work was much more complicated. The payment in the two countries worked out on the average to show that the American got as much for two and a half days' work as the British for a week. The representatives of several other trades, however, were greatly struck with what they saw, notably with the appliances here in the way of labor-saving machines. "We have no machine like that; we do that by hand," were remarks one often heard when going around with them. In this country, where so many factories are of recent erection, it is not surprising that they should be filled with new machinery, but there were interesting scrap-heaps to be shown in many that the delegates visited which proved how quick the American manufacturer is to throw out anything that has been improved upon. The English manufacturer is much slower to move in this respect, and he is inclined to hold on to an antiquated machine as long as he can get any work out of it. There were some conclusions arrived at incidentally by the delegates, on which they formed very definite opinions, although they did not exactly come within the scope of the Commission. The representative of the plasterers, who is a member of the London County Council, thinks that England has nothing to learn from the States in the way of civic government. They all thought the telephone service of the large cities admirable in comparison to that in England, but formed a different opinion of the postal service, one of them experimenting by timing the delivery of letters which he posted in New York to himself, with results that showed the service in London to be immensely superior.

Taking in the whole situation, seeing what one can of the workmen at work, talking to these visiting workmen who are experts in their various trades, just a few great conclusions force themselves home on the mind through a throng of conflicting detail. The workman is very much the same man on either side of the Atlantic. His environment is what alters, stimulates, or retards his potentiality. There was a strange story told me the other day to the effect that the Westinghouse Company brought over a large number of American workmen to the factory they had opened in England, and that, after a short time, they found that the work of their imported men could be beaten by men taken from the neighborhood of the works; that the Englishman on his own ground, in fact, beat the imported American. These facts, told me as they were by Americans, appear to me very significant, but fall in with some of the conclusions that strike home as the lessons of this Commission. We do not take sufficient account of many factors in this great problem. First of all, the climate. Look at the quickening effect of this bracing atmosphere on the more lethargic peoples. Jules Verne wrote a book, "Dr. Ox's Experiment," I think it was called, which describes the galvanizing effect on a lazy German town of supplying oxygen through pipes to the inhabitants. After passing the statue of Liberty and landing at the Battery, every immigrant must experience something of the sort. A great stimulating, vivifying, energizing quality is in the air of the country. One need not drink champagne here—one breathes it. Look at the effect on the Irish or Italian immigrant. The population of Ireland is exceeded here in the numbers of Irishmen, and Irishmen have accomplished immensely more here than on the other side, while the lazy Italian develops into a plodding, strenuous worker that Italy never knew. The essence of democracy he breathes also, and the workman of to-day may be the employer of to-morrow. The employers are more accessible to their employees—there is less of a dividing margin. Question 19 of the delegates' catechism is, "Are there greater opportunities for the workingman to rise in America than in England?" "Ten thousand times more," was the enthusiastic answer of one who in his progress from having been an immigrant workman to being a millionaire can speak from the personal knowledge of personal experience. When, in considering the environment of the workers, we

come to consider the standard of their comfort in either country, I unhesitatingly say it is higher here—higher because it is more civilized. The well-paid British workman probably has more good beef to eat, more good beer to drink, but there is a smaller percentage of baths in his house, and the American workman has a larger supply of literature in the form of cheap books, magazines, papers, etc., or, if it may be said that the English workman has an equal supply, the American is unquestionably the larger consumer of it. The various co-operative methods by which the American workmen get at their amusements are interesting; they club together for lectures, concerts, theaters, excursions, etc. Their versatility and quick-moving adaptability for going from one employment to another more easily than in old countries are remarkable, but have also their drawbacks. Their very independence has its penalty. It is too much to say that America has lost the idea of the family home as it is known in England, but is not the tendency in that direction?

This all seems drifting away from the Mosely Commission; but I think it is not. The great lessons of the quest will be found to be learned, not from any special panacea that touches the spot in a detail of piece-work or time-work, but in the great conditions naturally upspringing from, on the one side, men working on the surface of a virgin continent across whose breast "Fecundity" is writ large with fullest meaning. On the other, the progeny of generations of workers toil in a confined area under conditions that have become almost inherited. There is a good deal of brag and boast and surface-show of energy on the one side, on the other appearances of being hidebound by labor traditions and conditions. I doubt if the average workman works one bit harder in the new country than in the old. Expeditions like this commission cannot but work for good. Nations and continents cannot be brought too closely in conference, like the other day when representatives of the biggest industries of America and England debated all the afternoon about an eight-hour day. An eight-hour day for the workers of the world there is a flag-pole for the unions to rally to. The world has become too small a place for anything less effectual than world conferences. Ten hours in Germany, eight hours in Britain, is anomalous. The capitalists have here their Morgan. Who is to be the Pierpont Morgan of the Labor Trust of the world? The delegates will each bring back to his trade a number of detail suggestions and a mass of information; but the general verdict will not be in pointing out any great superiority in favor of America. They have been much impressed with the high pitch to which both capital and labor have been organized here. The lesson to be learned from this might naturally make for conflict in hard-fought strikes; but they have recognized in the Civic Federation an organization that could bring arbitration to bear on and to avert such conflicts.

If We but Knew

By Clarence Hawkes

If we but knew the secret of that power
That opes the bud in early days of spring,
If we but knew what makes the robin sing
His wondrous song just at the matin hour,
If we but knew the priceless boon and dower
Of human life when man is truly king,
If we but understood the little thing
That vexes us just at the present hour,
If we but knew—ah, well, 'tis vain to sigh
And speculate on things beyond our ken!
We know that earth is fair and life is sweet,
And something tells us that we cannot die,
And if we live and love the good, ah! then
We face to face with truth some day must meet.

James Bryce[1]

By Justin McCarthy

Author of "A History of Our Own Times," "The Story of Gladstone's Life," etc.

JAMES BRYCE is universally recognized as one of the intellectual forces in the British House of Commons. When he rises to make a speech, every one listens with the deepest interest, feeling sure that some ideas and some instruction are sure to come which no political party in the House can well afford to lose. Some men in the House of Commons have been orators and nothing else; some have been orators and instructors as well; some have been Parliamentary debaters more or less capable; and a good many have been bores. In every generation there have been a few who are especially regarded as illuminating forces. The House does not think of measuring their influence by any estimate of their greater or less capacity for mere eloquence of expression. It values them because of the lessons which they teach. To this small order of members James Bryce undoubtedly belongs. Now, I do not mean to convey the idea that such men as these are not usually endowed with the gift of eloquent utterance, or that they cannot deliver speeches which would entitle them to a high rank among Parliamentary debaters, no matter what the import of the speeches might be. My object is to describe a certain class of men whose Parliamentary deliverances are valued by members in general without any special regard for their form, but only with regard to their substance, for the thoughts which they utter and not for the manner of the utterance. James Bryce would be considered an effective and even a commanding speaker in any public assembly, but nevertheless, when the House of Commons and the public think of his speeches, these are thought of mainly for the truths they tell and the lessons they convey, and not for any quality of mere eloquence which adorns the exposition. In a certain sense James Bryce might be described as belonging to that Parliamentary order in the front of which John Morley stands just now; but of course John Morley has thus far had more administrative experience than James Bryce, and has taken a more distinct place as a Parliamentary and popular leader. Of both men, however, I should be inclined to say that their public speeches lose something of the praise fairly due to them as mere displays of eloquence, because of the importance we all attach to their intellectual and educational influence.

I may say also that James Bryce is not first and above all other things a public man and a politician. He does not seem to have thought of a Parliamentary career until after he had won for himself a high and commanding position as a writer of history. Bryce is by birth an Irishman and belongs to that northern province of Ireland which is peopled to a large extent by Scottish immigrants. We are all rather too apt to think of this Ulster province as essentially un-Irish, or even anti-Irish, in tone and feeling, although some of the most extreme among Irish Nationalists, men like John Mitchell for instance, were born and brought up in Ulster, and in more recent days some conspicuous Home Rulers have sat in the House of Commons as representatives of Ulster constituencies. James Bryce has always been an Irish Nationalist since he came into public life, and has shown himself, whether in or out of political office, a steady and consistent supporter of the demand for Irish Home Rule. Indeed, I should be well inclined to believe that a desire to render some personal service in promoting the just claims of Ireland for a better system of government must have had much influence over Bryce's decision to accept a seat in the House of Commons.

Bryce began his education in the University of Glasgow, from which he passed

[1] This forms the sixth of a series of articles on living British statesmen. The first, on Mr. Balfour, was printed in The Outlook for August 16; the second, on Lord Salisbury, in The Outlook for September 6; the third, on John Morley, in The Outlook for October 4; the fourth, on Henry Labouchere, in The Outlook for October 18; the fifth, on Lord Aberdeen, in The Outlook for November 1, 1902. Other subjects of articles will be Sir Henry Campbell-Bannerman, Sir Michael Hicks-Beach, Sir William Harcourt, John Redmond, John Burns.

on to Oxford, where he won many honors and has left the memory of a most successful career, not merely as student, but also as professor. He studied for a while at Heidelberg, where he cultivated to the full his previously acquired knowledge of German; and I have heard in later years on good authority that while Bryce was a member of Mr. Gladstone's Government he became a great favorite with Queen Victoria because of his capacity for fluent speech in the language which the late Queen loved especially to hear. Before he turned his attention to active political life Bryce studied for the bar, became a member of the profession, and actually practiced in the Law Courts for some years. Thus far, however, he had hardly given indication of the gifts which were destined to secure for him a high and enduring place in English literature. Thus far his life may be regarded as that of a student and a scholar; he had yet to give to the world the fruits of his scholarship. James Bryce is probably above all things a scholar. He is, I may venture to say, the most scholarly man in the House of Commons. I doubt whether there is in England so widely read a man in all departments of literature, art, and science as Bryce, now that Lord Acton has been removed from us by death. Long before his entrance into Parliamentary life Bryce had obtained the highest distinction as a writer of history. It is not too much to say that his great historical work, "The Holy Roman Empire," is destined to be an English classic and a book for all countries and all times. The author could hardly add to the reputation which he won by this masterpiece of historical study, insight, and labor, but it is only mere justice to say that every work of importance which he afterwards gave to the world has maintained his position in literature. His turn of mind has been always that which distinguishes the practical student—the student of realities, not the visionary or the dreamer, the man who, according to Goethe's phrase, is occupied more by the physical than by the metaphysical. In 1877 he published a narrative of his travels in Transcaucasia, with an account of his ascent of Mount Ararat. I believe no other traveler has ever accomplished such a practical study of Mount Ararat as that which was made by Mr. Bryce, and during a part of his explorings he was absolutely alone, as he could not prevail upon the guides belonging to that region to overcome their superstitious dread of an intrusion on certain parts of the mountain. He was always fond of travel and was able to bring some fresh ideas out of places long familiar to tourists, and he gave to the world in English periodicals the results of his experiences as a traveler. His descriptions of Icelandic scenery and of some rarely visited regions of Hungary and of Poland have a genuine literary as well as a genuine geographical value.

His most important work, after his great history of the Holy Roman Empire, is undoubtedly his book on "The American Commonwealth," published in 1888. This work has been read as generally and studied as closely on the one side of the Atlantic as on the other. I have heard it spoken of with as thorough appreciation in New York, Boston, and Washington as in London, Manchester, and Liverpool. Many years have passed since an eminent English public man, not now living, once expressed to me an earnest wish that some European writer would take up the story of the great American Commonwealth just where De Tocqueville left it in his "De la Démocratie en Amérique." I joined cordially in his ideas and his wishes, and we discussed the qualifications of certain Englishmen for the task if any of them could see his way to undertake it, but neither of us seemed to be quite satisfied that we had named the right man for the work. At the time it did not occur to either of us that the historian of "The Holy Roman Empire" would be likely to turn his attention to the story of the American Commonwealth. Indeed, the two studies seemed to me so entirely different and uncongenial that if the name of James Bryce had been suggested to me at the time I should probably have put it aside without much hesitation. One could hardly have looked for so much versatility even in Mr. Bryce as to favor the expectation that he could accomplish, with something like equal success, two historical works dealing with such totally different subjects and requiring such different methods of analysis and contemplation.

More lately still Mr. Bryce brought out

his "Impressions of South Africa." This book was published in 1897, and the time of its publication was most appropriate. It appeared when the prospects of a war with the Transvaal Republic were opening gloomily for the lovers of peace and fair dealing in England. If Mr. Bryce's impressions of South Africa could only have been appreciated, and allowed to have their just influence with the leaders of the Conservative party at that critical time, England might have been saved from a long and futile war, and from much serious discredit in the general opinion of the civilized world. But if Bryce had spoken with the tongue of an angel, he could not at such a time have prevailed against the rising passion of Jingoism and the overmastering influence of mining speculators. It is only right to say that the book was in no sense a mere distended political pamphlet. It was not meant as a counterblast to Jingoism, or as a glorification of the Boer Republic. It was a fair and temperate statement of the author's observations in South Africa, and of the general conclusions to which his experience and his study had brought him. Bryce pointed out with perfect frankness the defects and dangers which he saw in the Boer system of government, and even the most ferocious Jingo could hardly have felt justified in describing the author by that most terrible epithet, a "pro-Boer." The warning which Bryce gave, and gave in vain, to the English Government and the English majority, was a warning against the credulous acceptation of one-sided testimony, against the fond belief that the proclamation of Imperialism carried with it the right to intervene in the affairs of every foreign State, and against the theory that troops and gold-mines warrant any enterprise.

The Parliamentary career of James Bryce began in 1880, when he was elected as Liberal representative for a London constituency. He did great work in the cause of national education, and took an important part in two State commissions appointed to conduct inquiries into the working of the public schools. At a later period he was chosen to represent a Scottish constituency, and when Mr. Gladstone came into power as the head of a government he received the important office of Under-Secretary for Foreign Affairs. At that time his chief, the Secretary f Foreign Affairs, was a member of tl House of Lords, and therefore the who work of representing the department the House of Commons, where alone ar important debates on foreign questions a conducted, fell on Mr. Bryce, who had tl entire conduct of such discussions on beha of the administration. The department w one which gave an effective opportuni for the display of Bryce's intimate know edge of foreign countries, and he acquitte himself with all the success which migl have been expected from one of his inte lect, his experience, and his enlightene views. Later still he became Chancello of the Duchy of Lancaster, and for th first time had a seat in the Cabinet. Th Chancellorship of the Duchy of Lancaste is one of a small order of English admin istrative offices which have comparativel unimportant duties attached to their specia administration, and leave the man in pos session ample time to lend his assistance both in the Cabinet and in the House o Commons, to all the great public question which occupy the attention of the Govern ment. In 1894 he became President o the Board of Trade, one of the most im portant positions in any administration. Bryce's official career came to a close for the present when the Liberal party lost their majority in the representative chamber, and the Conservatives got into power and secured the administrative position which they are holding at the present day. Nothing can be more certain than that the first really Liberal administration which is again formed will assign to Mr. Bryce one of the highest places in its Cabinet and in its work. Since he has come to sit on the benches of opposition he has taken part in many great debates, and is always listened to with the most profound attention. He is one of the few leaders of the Liberal party who were manful and outspoken in their opposition to the policy which originated and carried on the late South African war. He has taken a conspicuous part in every debate upon subjects of foreign policy, of national education, and of political advancement. He has never acted as a mere partisan, and his intervention in debate is all the more influential as it is well understood that he advocates a policy because he believes it to be right and not because of

any effect it may have in bringing himself and his Liberal colleagues back again into power.

I have often noticed the effect which is produced in the libraries and committee-rooms, in the rooms assigned to those who dine and to those who smoke, when the news is passed round that Mr. Bryce is on his feet. A member who is reading up some subject in the library, or writing his letters in one of the lobbies, or enjoying himself in a dining-hall or a smoking-room, is not likely to hurry away from his occupation or his enjoyment in order to rush into the debating chamber merely because he is told that some leading member of the Government or the Opposition has just begun to address the House. The man who is addressing an audience in the debating chamber may hold an important office in the Government or may have an important place on the Front Bench of Opposition, but then he may be a personage who feels bound to take part in a debate merely because of the position which he holds, and every one knows in advance what views he is certain to advocate and what line of argument he is likely to adopt, and our reading or dining or smoking friend may not think that there is any pressing necessity for his presence as a listener in the House. But there are some leading men on both sides of Mr. Speaker who are always sure to have something to say which everybody wants to hear, and Mr. Bryce is unquestionably one of that happily endowed order. When the word goes round that Bryce is up, everybody knows that something will be said on which he cannot exactly calculate beforehand, something which it is important that he should listen to, and there is forthwith a rush of members into the debating chamber. There can hardly be a higher tribute to a man's importance as a debater than the fact that his rising to address the House creates such an effect, and I have seen it created again and again whenever the news went round that "Bryce is on his legs." I have many a time heard Conservative members murmur, in tones not altogether expressing absolute satisfaction at the disturbing information, "Bryce is up—I must go in and hear what he has to say." The tribute is all the higher in this case because Bryce is not one of the showy and fascinating debaters whom everybody wants to listen to for the mere eloquence and fascination of their oratorical displays. Everybody knows that when he speaks it is because he has something to say which ought to be spoken and therefore ought to be heard. It is known that Bryce will not make a speech merely because he thinks the time has come when some leader of Opposition ought to take part in the debate, if only to show that the Opposition is attending to its business.

This command over the House Bryce has always held since he became one of its members, and no man can hold a more desirable and a more honorable position. It is all the more to his credit because he does not aim at mere originality and never makes it a part of his ambition to say something astonishing and thus to excite and delight the mere curiosity of his audience. There have been and still are many members of the House who have made a reputation of this kind and are therefore always sure to command a full attendance merely because everybody expects that when they rise to their feet they are sure to make the House "sit up," if I may use this somewhat colloquial, not to say vulgar, phrase. Take such a man, for instance, as the late John Arthur Roebuck, a man of great intellect, master of a peculiar style of eloquence, who made himself only too often a splendid specimen of what might be called in American phraseology "a crank." All that could be said with certainty beforehand of Roebuck was that whenever he rose to speak he would say something calculated to startle or to puzzle the House. There are men of the same order, if not perhaps of quite the same debating qualifications, in the House at present—men who always draw a rush of members when they rise to speak because nobody can tell in advance what side they are likely to advocate or what sort of bewildering paradox they may set up and make up interesting if not convincing by the force of their peculiar style of eloquence. Bryce is emphatically not a man of this order. He is no lover of paradox; he has no desire to create a sensation; he merely wants to impress the House with what he believes to be the truth, and his great quality is that of

beacon and not of a flashlight. His arguments appeal to the intellect and the reasoning power; he speaks of what he knows; he has large resources of thought, experience, and observation to draw upon, and the listeners feel convinced beforehand that he will tell them something which they did not know already, or will put his case in some new and striking light.

The House of Commons well knows that it would lose one of its most valuable instructors if Bryce were no longer to occupy a place on its benches or were to condemn himself to habitual inactivity and silence. When the Conservative Government under Lord Salisbury came into power, and more especially after the late general election which brought them back with added strength, many of the Liberal leaders seemed to have grown weary of the political struggle. Something worse than mere apathy appeared to have set in, something more than mere despondency and disheartenment. Men on whom the Liberals of England had long been wont to rely suddenly showed an apparent loss of faith in all the proclaimed principles of the party, and either relapsed into utter silence or spoke in language which suggested an inclination to cross over to the enemy's camp. The two principal impulses to this mood of mind were the South African war and the Irish Home Rule question. The majority in the constituencies had become inflamed with the spirit of Jingoism, and could think of nothing but the war and the Imperial glory of annexing new territory. Feeble-hearted and weak-kneed Liberals began to think that the party could never hope for a return to power unless it too could blow the Imperial trumpet. Other Liberals made it manifest that they were becoming alarmed by the unpopularity of the Home Rule question, and were repenting the enthusiasm which had carried them too far along the path marked out by the genius and the patriotic resolve of Gladstone. A species of dry-rot appeared to have broken out in Liberalism. Before long a new section of Liberalism was formed, the principle of which appeared to be that its members should call themselves Imperial Liberals, and at the same time should support the Tories on the only important questions then under discussion—the policy of the South African campaign and the Irish National clai for Home Rule. Some of the men wl had held high office when Gladstone w in power, who had made themselves co spicuous by the ardor and the eloquen with which they supported his policy peace abroad and justice to Ireland, no openly avowed their renunciation of h great principles. There were others amor the foremost Liberals in the House Commons who, if they did not thus open take the renegade part, kept themselv quietly out of the active political field an allowed the movement of reaction to g on without a word of protest. Three least among the Liberal leaders took very different course. Three of them, least, not merely nailed their colors to th mast, but stood resolutely in fighting att tude beneath the colors and proved them selves determined to maintain the struggl These three men were Sir Henry Camp bell-Bannerman, John Morley, and Jame Bryce. There were others, too, it mus be said, who stood up manfully with thes three in defense of that losing cause o Liberalism which they could never b brought to regard as a lost cause. Bu the dauntless three whom I have jus mentioned were the most prominent an the most influential who went forth agains that great array of Toryism and Jingoism Bryce was in his place as regularly a ever during the whole of that depressing time, and he never failed to raise his voice when the occasion demanded his intervention on behalf of the true princi ples and practices of Liberalism. During that long, dreary, and disheartening sea son when despondent men were often disposed to ask whether there was any longer a Liberal party, Bryce made some of the ablest speeches he has ever delivered in arraignment of the Jingo policy, of the War Office maladministration, and the rule of renewed coercion in Ireland. The Liberal cause in England owes a debt that never can be forgotten to the three men whom I have named, for their un-flinching resolve and activity in the House of Commons; and of the three none did better service than that which was rendered by James Bryce.

Bryce has, in face and form, the characteristics of a stalwart fighter. His forehead is high and broad, with strongly marked eyebrows, straightly drawn over

deep and penetrating eyes. The features are all finely modeled, the nose is straight and statuesque, the hair is becoming somewhat thinner and more gray than it was when I first knew Mr. Bryce, but the mustache and beard, although they too show some fading of color, are still thick and strong as in that past day. The face does not look Irish; its expression is perhaps somewhat too sedate and resolute; but, on the other hand, it does not seem quite Scotch, for there is at moments a suggestion of dreaminess about it which we do not usually associate with the shrewd North Briton. Bryce is a man of the most genial temperament, thoroughly companionable, and capable of enjoying every influence that helps to brighten existence. Always a student of books and of men, he is never a recluse, and I do not know of any one who seems to get more out of life than does this philosophic historian. Bryce's London home is noted for its hospitality, and his dinner parties and evening parties give much delight to his large circle of friends. Mr. and Mrs. Bryce are not lion-hunters, and do not rate their friends according to the degree of celebrity which each may have obtained. But they have no need to engage in a hunt after lions, for the celebrities seek them out as a matter of course, and I know of no London house where one is more certain to meet distinguished men and women from all parts of the civilized world. Bryce's travels have made him acquainted with interesting and eminent persons everywhere, and an admission to his circle is naturally sought by strangers who visit London. Representatives of literature, science, and art, of scholarly research, of political movement, and of traveled experience are sure to be met with in the home of the Bryces. I had the good fortune to meet there, for the first time, many distinguished men and women whose acquaintance it was a high and memorable privilege to make. Among Bryce's especial recreations is mountain-climbing, and he was at one time President of the Alpine Club. He can converse upon all subjects, can give to every topic some illustration from his own ideas and his own experiences, and the intelligent listener always finds that he carries away something new and worthy of remembrance from any talk with him. Although his strong opinions and his earnest desire to maintain what he believes to be the right side of every great controversy have naturally brought him into frequent antagonism with the representatives of many an important cause, I do not know of any public man who has made fewer enemies or is more generally spoken of with respect and admiration. A man must have very high conceit indeed of his own knowledge and his own judgment who does not feel that he has a great deal to learn from conversation with a master of so many subjects. Yet Bryce never oppresses a listener, as some intellectual leaders are apt to do, with a sense of the listener's inferiority, and the least gifted among us is encouraged to express himself with frankness and freedom while discoursing with Bryce on any question which happens to come up. I think that among his many remarkable qualities is that sincere belief which was characteristic of Mr. Gladstone, and for which Gladstone did not always get due credit—the belief that every man, however moderate his intellectual qualifications, has something to tell which the wisest would be the better for knowing. We must all of us have met scholars and thinkers and political leaders whose inborn sense of their own capacity had an overbearing and even oppressive effect on the ordinary mortal, and made him shy of expressing himself fully lest he should only be displaying his ineptitude or his ignorance in such a presence. But there is nothing of this to be observed in the genial ways of James Bryce, and the listener finds himself unconsciously brought for the time to the level of the master and emboldened to give free utterance to his own ideas and opinions.

Bryce has been made a member of most of the great intellectual and educational institutions of the world, has held degrees and honors of various kinds from the universities of Europe and the United States, and could hardly travel anywhere abroad or at home without finding himself in recognized association with some school of learning in every place where he makes a stay. The freemasonry of intellect and education all over the world gives him rank among its members, and receives him with a welcome recognition wherever he goes. I presume that in the political sphere of action he is henceforward likely

to find his congenial career, but he must always have the knowledge that, if for any reason he should give up his political occupation, he can at any moment return to some pursuit in which he has already won an established fame. There are not many political leaders of our time about whom the same could fairly be said. For myself I may frankly say that I hope James Bryce will henceforward devote himself especially to that political career in which he has accomplished such great things. English public life cannot well afford to lose his services just now and for some time to come. A man who can bring to political work such resources of thought and of experience, who can look beneath the surface and above the mere phrases and catchwords of political parties, who can see that Liberalism in its true sense must mean progress, and who can at the same time see clearly for himself what progress really means, and in what direction and by what methods it is to be made—such a man could ill be spared by the Liberalism of our generation. The historical work he has already done is, in its way, complete and imperishable. But the Liberal party has yet to recover its place and to regain the leadership of England's political life. Every effort which the Conservatives in office have lately been making to hold their full mastery over the country has only shown more and more clearly that they have not kept up with the movements of thought and are not able to understand the true requirements of the time. On the other hand, the limp and shattered condition of the existing Liberal party only shows the absolute necessity for the recognized leadership of men who understand the difference between the work of guiding the country and the ignoble function of competing for power by imitation and by compromise. In the new effort now so sorely needed to create once more a true Liberal party, the country requires, above all things else, the constant service of such men as James Bryce.

The Young Finlander and the National Spirit

By H. Montague Donner

EVENTS have moved with a swift pace indeed since the writing of my article published in The Outlook of September 20, 1902, and the last gleam of hope that feebly irradiated the murky skies of oppression hanging over Finland has now faded away, leaving the inhabitants of that unhappy land gazing in consternation at the dark horizon where national obliteration begins.

Now that the mask has been definitely dropped from the Russian designs and active persecution ushered in with the issue of the famous—and infamous—ukases of October 2, the paramount care of the Finnish people is no longer to appeal, but to act; no longer to entreat, but to resist; and from the generation but recently out of its teens must the larger works of salvation come.

Hence it becomes incumbent upon us to understand something of the status of parties and the workings of public opinion in Finland, and more particularly to familiarize ourselves, if possible, with the plan of action of the generation of young Finlanders on whom the problem of the future weighs most immediately and heavily.

From the time when the Swedish Helsings first established themselves through right of conquest on Finnish soil, and more markedly since the beginning of Muscovite domination, there has existed in Finland a dual racial problem, which, at all times difficult of solution, has not infrequently been marked by an access of bitterness on the part of the factions concerned that has invariably proved a source of weakness by which the wily Russian has seldom failed to profit when occasion invited. The language question it was that long divided Finland, to its undoubted injury, into the rival camps of the Svekomans and Fennomans.

As the names indicate, the Svekomans

comprised the inhabitants of Swedish extraction, inhabiting the western, southwestern, and part of the southern coast line to a distance of about eighteen miles inland, and speaking as their mother tongue the language of their neighbors across the Gulf of Bothnia, and imbued with the traditions of Swedish social, political, and literary supremacy; while under the banners of the Fennoman faction were gathered the people of pure Finnic stock, whose aim was the triumph of the Finnish idiom, not merely as the dominant factor in the domains of society and government, but also as the proper expression of the national spirit.

It was but natural that the majority of the governmental body and the official class as a whole should belong to the Svekoman party, and just as natural that the guns of the Fennomans should be trained upon them with most pertinacity and determination. It was also only in the order of things—according to decree of nature, let us even admit—that the Fennomanic ideal, especially since the discovery of the Kalevala, of a young and vigorous people, distinctively Finnish in character and tongue, ready to take its place in the ranks of nations by the side of the recently emancipated Rumania, Servia, and Bulgaria, should have steadily continued to gain adherents among the rising generation, irrespective of party affiliations. Thanks largely to the more or less active interference of Russian diplomacy—whose peculiar forte it has always been, constantly is, and ever will be to foment discord and create disunion in the ranks of its present or prospective victims, and which saw in the weakening of the hitherto superior political power the most favorable opportunity for hastening the accomplishment of its own nefarious designs on the autonomy of Finland itself—the Fennomans succeeded, as the struggle went on, in gaining material advantages over their Svekoman rivals. The Finnish language came to be recognized as on an equal footing with Swedish as the official tongue, and an ever-increasing proportion of important government posts fell to the share of the party.

The present crisis, affecting as it does the very life of the Finnish nation, has, however, revolutionized the old standing of parties, and we hear little nowadays of Svekoman and Fennoman hostility. In the face of the threatened extinction of the national life, the Svekomans, guided by the wise counsels of Van Born, Wrede, Schybergson, Axel Lille, former editor of the suppressed "Nya Pressen," and V. Söderhjelm, have abandoned their uncompromising attitude on the questions of language and franchise reform, to devote all their energies to the defense of the common fatherland, while the Fennoman party has split into two irreconcilable halves, the Old Finns and the Young Finns. The last-named faction, under the leadership of ex-Consul Wolff (whose speech at St. Petersburg on behalf of Finland on the occasion of the first monster petition to the Czar in 1899 made such a profound impression in Europe), Castrèn, the writer Aho, the poet Erkko, and Professor Otto Donner, have thrown to the winds the old differences with their Swedish-speaking fellow-countrymen, with the result that the two have coalesced under the title of the Constitutional party, which proclaims as its one great object the retention of the autonomous government of Finland, and has come to represent the sentiment of the nation at large, with whom the Senate and the Old Finns have fallen into complete disfavor.

The policy of this latter party, sacrificing everything, from the time of the first manifesto of February, 1899, to the fetich of party aggrandizement, has been one of consistent abandonment of all opposition to the autocratic will of the Russian Government, of abject surrender at each successive attack of the cohorts of bureaucracy; and in this attitude of self-effacement, ardently advocated in its semi-official organ "Uusi Suometar," it has had the guidance of three men of signal ability and far-reaching influence, Archbishop Johansson of Abo, and former Senators Yrjö-Koskinen and J. R. Danielson, the latter an eminent jurist and political writer, and in earlier days one of the stanchest upholders of Finnish autonomy and opponents of Russian aggression. Yrjö-Koskinen is in some respects the foremost figure in the Grand Duchy—a man of great mental alertness, abounding energy, and a personal influence that once seemed little short of hypnotic. But that this strange power of his is at last deserting him in some measure is shown by the

fact that many of his former adherents have lately left him, among them Tudéer, formerly Vice-President of the Senate, and hitherto one of the most faithful dancers to Koskinen's piping, while A. Meurman, a communal councilor and one of the most influential of the faction, shows signs of kicking over the traces and transferring his allegiance to the Constitutional party.

The specious plea of the Old Fennoman party has been that, by due and "loyal" submission to the will of their monarch, the Finnish people would retain the Czar's good will and at the same time build a bridge over the present chasm of misunderstanding upon which the autocrat and his Finnish subjects may meet at some future day of enlightenment and perfect a compact whereby an equal measure of justice to both Finland and Russia shall be insured. Surely it is small matter for wonder, in view of the latest manifestations of the Russian Government's hatred of Finnish institutions, its indifference to past promises and pledges, and its contemptuous flouting of its servile instrument, the "reorganized" Finnish Senate, and the reduction of that body to an innocuous "advisory" capacity, that the more self-respecting among Yrjö-Koskinen's followers should have commenced to blush for their weakness, and that the Old Fennoman faction should now show, in spite of frantic efforts to disguise its real condition, unmistakable signs of approaching disintegration.

Among a people so imbued with the spirit of liberty as the Finns, the doctrine of blind obedience to the behests of a despot can find acceptance no more readily than it did among the English under Charles I. and James II., or the Dutch under Philip of Spain. Against the granite-bound steadfastness of the elemental Finn it is in vain that the storm breaks and rages.

For of what is compounded the elemental Finn? That we may comprehend the might of his bloodless resistance, we ask: "Who and what is this stern son of the North, to the full stature of whom the Russian autocrat, by the very nature of a tyrant's limitations, must ever fail to grow?" Verily, he is the child of the rock-ribbed land that gave him birth—tenacious of purpose as the rock-clasping roots of his native pine; slow in the form ing of opinion as the growth of his prime val forests, but unendingly stubborn in th maintenance of it when formed; slow t wrath, but, if once aroused, silent and im placable in the nursing of his resentment From his childhood at war with nature t wring from her a scant livelihood, he feel that when he has learned to conquer he she is, verily, his mother; that, mother like, she is tender with him, eager out o her penury to lavish upon him of her best She sets on his brow the triple crown o fortitude, patience, and resignation, whis pering to him that, rooted in her, flesh o her flesh and bone of her bone, he must be both tender and indomitable, unyield ingly true to her and her ideals, and ready to defend them to his last gasp.

Out of this close daily communion with the soul of Nature, and the contemplation of her orderly processes, the Finn has drawn a fundamental faith in God and a belief in ultimate divine justice that is nowhere excelled, if anywhere equaled, on the face of the earth; and, concomitantly with this spiritual conviction, he is imbued with a regard for law and order that amounts almost to veneration. When, therefore, he sees these overturned with complacency, if not positive derision, by a hand that he had for a century been accustomed to look upon as that of, in the main, a guardian and well-wisher, what wonder that he undergoes a gradual revulsion of feeling, culminating in silent wrath and hatred of the alien tyrant who, robbing him of one cherished birthright after another, would reduce him to the debased level of the ignorant, spiritless Russian *mujik!*

In view of the fact that the last faint hope of ultimate justice has been dispelled by the retention of Bobrikoff as Governor-General, followed by the placing of supreme power in his hands, at the cost of the independence, not only of the Senate (which, considering the present "reorganization" of that body, is of little consequence), but even of the judiciary, hitherto the final bulwark of Finnish liberties, the present generation of Finland finds itself compelled to adopt a definite plan of action to avert the destruction, not merely of its autonomous form of government, but of the national existence itself.

And what is this plan of action? As

far as it has been definitely evolved, it consists, first and foremost, of a silent movement, practically universal in Finland, to carry out to the limit the doctrine of passive resistance to each and every step of Russian aggression. In the matter of the problem most pressingly confronting the Finnish people, the enlistment in Russian regiments of the youth of the country, who, after much pressure, were induced or frightened last summer into finally responding to the illegal ukase (which the clergy throughout the country refused to read from their pulpits), and presenting themselves for military inspection and enrollment (to the number of only 14,642 out of a total of 25,080 summoned), this resistance takes the form of a refusal to appear at the impending mustering-in. This action has been deliberately determined on, despite a printed appeal issued by certain of the Old Fennoman faction as the result of a meeting called by its leaders and held in Helsingfors last October, under the presidency of Professor Danielson, to consider the best means of meeting the threatened widespread "rebellion against authority"—which meeting disclosed a pitiful attendance of some fifty-odd members, and furnished indubitable proof of the general disrepute into which the Senate and the Russophile faction have fallen.

This, however, represents but a phase of the activity of young Finland. A work of incalculable importance has also been for some time in operation—that of instilling in the minds of Finnish children of all classes an adequate sense of the sacredness of Finnish constitutional liberties and law; an intimate knowledge of the traditions and history of the race; an abiding love for its literature, as enshrined in Kalevala and the poems of Runeberg, Topelius, and others; and a vital conception of Finland's standing and mission among the nations. In this labor of love no hamlet is too remote for the step of the teacher to penetrate or the voice of the Finnish patriot to reach. Officials who, trembling for their means of livelihood, give way to Russian pressure, are, cruel though it may seem, at once made to feel the public resentment and scorn, while a widespread movement has been set afoot, in which the women of the stricken land play an important part, to practice a rigid economy in household matters, especially by abandoning luxuries of every description and limiting the scope of family and social festivities, so as to provide a gigantic national fund for the assistance of conscientious and fearless officials who have been arbitrarily deposed by the Governor-General to make way for Russian interlopers.

But the most formidable project of all the plans mooted, the most aggressive and threatening toward the Muscovite oppressor, and most pregnant with possibilities of his discomfiture, is one that has been lately put forward in all seriousness, and in the present hopelessness of the Finns has found wide acceptance where it would have been scouted even a twelvemonth ago as too radical a departure from Finnish traditions. This is nothing less than to place Finland at the head of all the dissatisfied factions and nationalities tributary to Russia and systematically ground down by her ruthless bureaucratic machinery: the Poles, Lithuanians, Esthonians, Courlanders, Little Russians, Caucasians, and Jews, and the constantly growing revolutionary party in the body of the Empire itself, thus supplying the indispensable cohesion so far lacking among these various elements.

Never has dissatisfaction with the ruling class been so widespread among all classes in Russia itself as it is now, when even those parts of the social organism that have hitherto been most devoted to the doctrine of blind submission are becoming permeated with the ideals of social and political regeneration, and when even the military arm of the State has begun to show signs of disaffection most alarming to the bureaucratic class. Therefore, having nothing more to lose, these young Finlanders argue, it becomes Finland's highest duty to proclaim herself the champion of the struggling cause of liberty and enlightenment throughout the Muscovite Empire. Then, by inculcating among all the dissatisfied factions the doctrines of constitutional law and liberty, as she has herself practiced and perfected them, she will crystallize the purpose of the hitherto disunited and ill-organized bodies, furnish them with a perfectly definite programme which they shall unitedly strive their utmost to bring to triumphant adoption, and direct their ca[illegible]he

invaluable aid of Finnish enlightenment and practical experience in sound, progressive social and political organization. Violence will be discredited as out of keeping with the fundamental Finnish reverence for orderly development, and this very fact will, it is confidently expected, be the means of greatly strengthening the movement and securing for it the practical adhesion of the more stable and responsible elements of the social structure, which are none the less determined on a change in the principles of government because they discountenance the "propaganda of the deed." Though the present generation may not live to see it, the triumph of the great liberating movement will undoubtedly be greatly hastened by the active participation in it of the people of Finland, armed with the wisdom and knowledge garnered during centuries of gradual political development and its accompanying moral and intellectual achievement. Then will Finland once more come by her own, and the vision of Tolstoï be fulfilled, when Russia shall achieve her real unity through the peaceful process of being Fennicized, instead of through the incredibly blind and fatuous policy of the attempted Russification of Finland by the strong arm.

And what then remains for such of Finland's sons as have taken up their abode without the gates and watch their country's pain and peril from afar in sheltered peace? Have they no duty, too? Can they not take part in the battle for justice and restitution? Of a surety they did not flee from present oppression and suffering in their native land with the desire to evade all responsibility in the tremendous task that confronts the Finnish youth and manhood of to-day. They may say, "We must contribute of our means to swell the patriotic funds at home." Well and good, but does their responsibility end with this immediate material aim? No; theirs is the further duty of spreading a fuller knowledge of Finland, its institutions and its people, among the nations of the earth, so that no portion of the civilized world may remain in ignorance of the part which that far northern land, humble and forgotten though it have lain these centuries past, has played and continues to play in the world drama of political, social, and intellectual progress. By the slow but unfailing force of example, by word and deed, they must show what splendid training Finland has given her sons in citizenship and culture, and thus bring to the various lands of their adoption the well-defined conviction that the whole world is concerned, in a very real and vital sense, in the final defeat, not merely of Russia's intended annihilation of Finland's national life and thought, but *of each and every attempt of an inferior civilization to destroy a higher one*, under whatsoever pretext or by whatsoever means such attempt be made. So shall the time assuredly be hastened—though we live not to see it—when the triumph of broad, enlightened international opinion over the narrow dictates of national prejudices shall have ceased to be a mere dream of Utopia!

The Boer Side of the Boer War[1]

IF Sir Conan Doyle's description of the Boer War is regarded as a British apologia, General De Wet's book may with equal justice be regarded as a Boer defense. Coming only a fortnight after the appearance of ex-President Kruger's memoirs, it challenges attention because, like Oom Paul's story, it is written with simplicity, directness, vividness; and it challenges comparison with Oom Paul's work because it seems to be animated by a greater regard for exactness of statement, because of the absence of archaic notions, of deep-rooted prejudices, which disfigure the pages written by the venerable exile in Holland.

General De Wet's book is one which should be read both by pro-Britons and pro-Boers, because of its reasonableness; the author seems to be aware of this quality, and dedicates the volume "To my fellow-subjects in the British Empire." Such a striking dedication, together with

[1] *Three Years' War.* By Christiaan Rudolf De Wet. Frontispiece by John S. Sargent, R.A. Charles Scribner's Sons, New York.

the author's closing words of loyalty to his adopted country, have called out two criticisms. Some, to whom Christiaan Rudolf De Wet has been not only an ideal cavalry leader and strategist, but also in unbending Boer loyalty an ideal hero, declare that he must have somehow sold himself, that the book with its dedication represents the first step in his preferment by Great Britain, and hint that by such means the British Government may finally have ended a war which was draining the best blood and treasure of England and her colonies. Others, however, pro-Boer as well as pro-British, feel, in our author's words, that "loyalty pays best in the end, and loyalty alone is worthy of a nation which has shed its blood for Freedom."

Before considering General De Wet's treatment of the war it is well to consider General De Wet himself. His portrait by Mr. Sargent, the frontispiece of the volume, tells us at a glance much about the man. No better delineator of the human face could have been chosen for this purpose than our foremost American portrait-painter; in his work we see the "slim" Boer—that shrewd, alert, clever, calculating, indomitable something which has distinguished the best as well as the worst Boers, which was as evident in a Joubert as in a Kruger. The portrait is one which remains impressed on the mind; long after we have closed the pages of this volume we see the man's face before us at every turn; and his face gives a double impact to his words.

Those words are both descriptive and critical. As to description, they do not narrate what the author himself has not seen. In this respect the "Three Years' War" is a soldier's story, first-hand and unpadded, in many respects worthy to stand alongside two accounts by great soldiers of their own experiences—General Grant's "Autobiography" and Lord Roberts's "Forty-one Years in India." While there is not a page of the description which is not readable, perhaps the most interesting are those pages which give us a new realization of the staggering blow to Boer enthusiasm dealt by Lord Roberts's victory at Paardeberg—the turning-point of the war—involving the defeat and capture of General Cronje. That Boer officer, by his obstinacy in maintaining a hopeless position, General De Wet thinks, really brought the defeat upon himself, whereas he might have sought to make good his escape in a night attack upon the beleaguering forces. "If I presume to criticise his conduct on this occasion," says our author, "it is only because I believe that he ought to have sacrificed his own ideas for the good of the nation, and that he should not have been courageous at the expense of his country's independence, to which he was as fiercely attached as I." Intrepid soldier that he was, General Cronje evidently thought that to abandon his laager was quite too much for De Wet or any one else to ask; at all events, the latter says that, while Cronje's view was either to stand or fall with the laager, he did not consider the certain consequence of a possible fall, namely, an "indescribable panic throughout not only all the laagers on the veldt, but even those of Colesberg, Stormberg, and Ladysmith." For "if Cronje were captured, how could any ordinary burgher be expected to continue his resistance?" To the contention of the Cronje party that, had the attempt been made which De Wet urged, the Boers would have been pursued and overtaken by Lord Roberts's forces, our author replies:

> The English at that time did not employ as scouts Kaffirs and Hottentots, who could lead them by night as well as by day; moreover, with the reinforcements I had received, I had about sixteen hundred men under me, and they would have been very useful in holding back the enemy until Cronje had made his escape. No words can describe my feelings when I saw that Cronje had surrendered and noticed the result which this had on the burghers. Depression and discouragement were written on every face. The effects of this blow, it is not too much to say, made themselves apparent to the very end of the war.

After this surrender De Wet immediately set about doing what he could to allay the panic which had seized upon the Boers. Feeling that Lord Roberts's troops must remain for some time at Bloemfontein in order to obtain needed rest, De Wet decided to take advantage of the expected circumstance; for, in his opinion, there was but one way to restore Boer prestige—to let his soldiers go home, and there to weed out all of the incapables, or discouraged, or traitors; then, with those who were willing to fight to the end, to make another stand. De Wet felt sure

that the best fighters would return in full number. His confidence was ultimately well justified. General Joubert, who had come from the Transvaal into the Free State hoping to be able there to discover some method for checking Lord Roberts's advance, was anything but pleased to hear of the De Wet plan, and exclaimed:

"Do you mean to tell me that you are going to give the English a free hand, whilst your men take their holiday?"

"I cannot catch a hare, General, with unwilling dogs," I made reply. But this did not satisfy the old warrior at all. At last I said: "You know the Afrikanders as well as I do, General. It is not our fault that they don't know what discipline means. Whatever I might have said or done, the burghers would have gone home; but I'll give you my word that those who come back will fight with renewed courage." I knew very well that there were some who would not return, but I preferred to command ten men who were willing to fight rather than a hundred who shirked their duties.

Among British Generals, General Knox occupies most space in the book. Lords Roberts and Kitchener seem to have comparatively scant consideration. The author's most interesting reference, however, is to General Buller. He says that "whatever his own people have to say to his discredit, Sir Redvers had to operate against stronger positions than any other British General." Concerning his own achievements, the best of the war, the most brilliant leader that any recent war has produced is, as we should expect, modest, and extremely concise in language, especially in describing the battle at Sanna's Post, where the hitherto little-known burgher administered such a crushing defeat to Colonel Broadwood that no less than 350 Englishmen were killed or wounded, and 480 prisoners, 7 cannon, and 117 wagons captured. A few days later, with only 800 men, near Reddersburg, facing three times that number of English, De Wet inflicted a similar defeat—a defeat, however, characterized, according to our author, by treachery on the part of the British. They had hoisted the white flag, and De Wet with his men galloped towards them, but before they reached them the British again began to shoot, killing a Boer officer.

This treacherous act enraged our burghers, who at once commenced to fire with deadly effect. Soon the white flag appeared above almost every stone behind which an Englishman lay, but our men did not at once cease firing. Indeed, I had the greatest difficulty in calming them and in inducing them to stop, for they were, as may well be imagined, furious at the misuse of the white flag. Strewn everywhere about on the ground lay the English killed and wounded. According to the official statement, they had a hundred casualties, the commanding officer himself being among the killed. We took four hundred and seventy prisoners of war.

While there are undoubtedly two sides to this story (the misuse of the white flag is said to have characterized the Boers more than the British), there is one feature of the Boer conflict—the horrors of the war as affecting women and children—which justifies vigorous language. Before Lord Roberts left South Africa he had issued proclamations prescribing that any building within ten miles of the railway where the Boers had broken up the railway line should be burnt down.

This was also carried out, not only within the specified radius, but also everywhere throughout the State. Everywhere houses were burnt down, or destroyed with dynamite; and, worse still, the furniture itself and the grain were burned, and the sheep, cattle, and horses carried off. Nor was it long before horses were shot down in heaps and the sheep killed by thousands by the Kaffirs and the national scouts, or run through by the troops with the bayonets. The devastation became worse and worse from day to day. And the Boer women—did they lose courage, with this before their eyes? By no means. As when the capturing of women (or rather the war against them and against the possessions of the Boers) commenced, they took to bitter flight, to remain at least out of the hands of the enemy. In order to keep something for themselves and their children, they loaded the carriages with grain and with the most indispensable furniture. When then a column approached a farm, even at night, in all sorts of weather, many a young daughter had to take hold of the leading-rope of the team of oxen and the mother the whip, or *vice versa*. Many a smart, well-bred daughter rode on horseback and urged the cattle on, in order to keep out of the hands of the pursuers as long as at all possible, and not to be carried away to the concentration camps, which the British called refugee camps (camps of refuge). How incorrect indeed! Could any one ever have thought before the war that the twentieth century could show such barbarities? No. Any one knows that in war cruelties more horrible than murder can take place, but that such direct and indirect murder should have been committed against defenseless women and children is a thing which I should have staked my head could never have happened in a war waged by the civilized British nation. And yet it happened. Laagers containing no one but women and children and decrepit old men were fired upon with cannon and

rifles. . . . I could append now hundreds of declarations in proof of what I say.

It is, however, when General De Wet comes to speak of something to him still more incredible, the treachery of his own men, under the work of national (Boer) scouts used by the British, that his language becomes more forceful:

England's great power was pitted against two little Republics which, in comparison with European countries, were nearly uninhabited. The mighty empire employed against us, besides its own English, Scotch, and Irish soldiers, volunteers from the Australian, New Zealand, Canadian, and South African colonies, hired against us both black and white nations, and, what is worst of all, national scouts from our own nation, sent out against us. . . . If there had been no national scouts and no Kaffirs, in all human probability matters would have taken another turn. . . . The English only learned the art of scouting during the latter period of the war, when they made use of Boer deserters. . . . The English, we admitted, had a perfect right to have such sweepings and to use them against us, but we utterly despised them (the deserters) for allowing themselves to be hired. We felt that their motive was not to obtain the franchise of the Uitlanders, but—five shillings a day! And if it should by any chance happen that any one of them should find his grave there—well, the generation to come would not be very proud of that grave. No! it would be regarded with horror as the grave of an Afrikander who had helped to bring his brother Afrikanders to their downfall. . . . Such men, alas! there have always been, since in the first days of the human race Cain killed his brother Abel. . . . It was far easier to fight against the great English army than against treachery among my own people, and an iron will was required to fight against both. If only our orders had been carried out a little more strictly, and if only the most elementary rules of strategy had been observed in our efforts to break the British lines of communication, Lord Roberts and his thousands of troops would have found themselves shut up in Pretoria, where they would have perished of hunger. . . . Had not so many of our burghers proved false to their own colors, England, as the great Bismarck foretold, would have found her grave in South Africa.

Many an excerpt might be taken from this interesting volume, full of description—perhaps not always exact enough—and equally full of criticism which spares neither friend nor foe. His foe triumphed in the end. It was an expected triumph, but a quarter-million men were finally required to bring down such "embattled farmers" as De Wet, Delarey, and Botha. Finally these were brought low. Resistance was no longer possible. They did the manly, the courageous, and what to many seems the impossible thing, they not only submitted to the conqueror, they pledged allegiance to the only Government which thenceforth could rule in South Africa. They had fought for independence and freedom; in losing independence who shall say that they have not gained a greater freedom than any they had yet enjoyed or could enjoy under a Boer oligarchy? It is to be hoped that the magnanimous spirit of General De Wet animates the majority of his countrymen. In impressive words he thus sums up his own position: "There was nothing left for us now but to hope that the Power which had conquered us, a Power to which we were compelled to submit, though it cut us to the heart to do so, and which, by the surrender of our arms, we had accepted as our ruler, would draw us nearer and ever nearer by the strong cords of love."

Bishop Potter on Industrial Duties[1]

BISHOP POTTER'S Yale lectures consist of two very distinct parts: first, the personal observations of the author regarding the moral side of the industrial relationships of our modern life; and, second, the statistical generalizations which his reading upon the subject has led him to accept. The first of these portions is fortunately much the larger, for it is incomparably the better. Bishop Potter's incursions into the field of economic statistics seem to have been chiefly confined to the study of such popularizers as Mr. Mallock and Mr. Willey, and his uncritical citation of their views gives this part of the work a capitalistic trend quite at variance with most of Bishop Potter's personal observations. Nothing could seem more capitalistic, for example, than Bishop Potter's apparent approval of Mr. Mallock's citation of

[1] *The Citizen in his Relation to the Industrial Situation.* Yale Lectures by Henry Codman Potter, D.D., LL.D. Charles Scribner's Sons, New York.

Leoni Levi's assertion that the entire rental "of all the land in England, if divided equally among the adult population, would give each man about two pence a day and each woman about three halfpence." Were the statement true, it would be but a hackneyed method of belittling the concentration of wealth; and it has not even the merit of being true. The income of English landlords, as returned by themselves for taxation, is $250,000,000 a year from agricultural land alone, $900,000,000 from city land and houses, and $50,000,000 from mines and quarries—a total of twelve hundred millions, or an average of $150 a year for every family in the nation. If this estimate be cut in two because the tax returns include the rental of houses as well as land, the figure is still treble that indicated by Mr. Mallock. The American figures cited upon the same question of the distribution of wealth are better grounded, but also stand in need of more critical treatment. The money wages of city workmen, it is stated on good authority, rose about 50 per cent. between 1860 and the early seventies, and, on the whole, kept this gain during the twenty years of falling prices which followed, so that the purchasing power of wages in 1891 was from 60 to 70 per cent. greater than in 1860. The rate of interest, it is next stated upon no authority, fell from seven per cent. twenty years ago to four or five per cent to-day. Then from these two statements there is deduced the startling conclusion that "the last quarter of a century—to speak in general terms—has brought to the workingman an increase in his earnings of from 60 to 70 per cent., while the same period has cost the capitalist the loss of from 20 to 30 per cent. upon his." This conclusion rests upon a perfect network of unwarranted assumptions. In the first place, it is assumed that the earnings of workmen rose from 60 to 70 per cent. during "the last quarter of a century," whereas the figures cited showed no advance since 1873, except such as came from the fall in prices. If this fall in prices increased the purchasing power of the wages of workmen—who had to meet advancing rents—it also increased the purchasing power of the interest of the capitalist, who generally profited by the advance in rents. Yet no such correction is made in reckoning the change in the capitalist's income, and the rate of interest he receives is reckoned to have decreased two or three times as rapidly as the census figures show. It is to be regretted that a book which ought to be read so widely as this of Bishop Potter's should contain such one-sided statements regarding the important subject of the economic separation of classes.

Fortunately, these statements do not indicate the spirit of the book. No recent writer has brought out more sharply than does Bishop Potter the separation of classes which the spirit of Christianity is bound to combat. "It is in vain," he says, "that we endeavor by amiable sophisms . . . to obscure to ourselves or to others that tremendous cleavage which in our time has come to pass between the rest of human society and those who make up what we call the working classes. . . . Almost the worst enemy to the progress of human society is the spirit of caste; and the tragic element in the constitution of our modern social structure is that, under forms of government that profess long ago to have renounced and abandoned it, it still rears its head in forms more insolent and more mischievous than any that in any age of human history it has assumed."

This citation indicates the moral temper with which Bishop Potter regards the growing power of the capitalist class. Its dominant spirit of commercialism is a thing utterly hateful to him, and its arrogant attitude toward the men who do the work of manual laborers is even more repellent than the same attitude when assumed by the heirs of a long line of feudal ancestry. There are many practical suggestions as to the methods by which the public can curb aggression on the part of organized wealth, and there are still more practical suggestions as to how it may lift up the manhood of the poor by shortening the hours of labor and granting wages and conditions which permit wholesome living.

The observations made to the well-to-do classes regarding their industrial duties are by no means confined to the direct employers of labor. Every one who purchases goods, Bishop Potter strongly urges, is indirectly an employer of labor, and is morally bound to give his or her trade to factories and stores which treat

their employees honorably and well. Nor do our industrial duties end with our treatment of those who serve us. We all have another and most vital duty in the matter of moderating our demands for service from others. One of the most dangerous foes of the higher life of our modern communities is the temptation to luxury. It corrupts, says Bishop Potter, not only the rich who yield to it, but the poor who witness it. "As enervating character, as debauching morals, as threatening—nay, destroying—the purity of the family and the integrity of the individual, there is no other single influence that can surpass it, if there is any that can equal it. Ask any experienced worker among low and outcast women what in the case of young girls has been most productive in inducing those awful lapses that consist in the prostitution of the human body, and they will tell you what madness seizes upon the young when the lust of personal display is appealed to by a gold brooch or a pair of diamond earrings. . . . The question must needs come home to every man and woman among us: 'If I have wealth, how far am I warranted in indulging this craze, in feeding this passion, whether in myself or others, or in using great expenditure in whatever form to promote the creation of a standard by which no good end is served and every bad and base passion inflamed and stimulated?'" If we would have the community free from materialism, our own lives must not be ruled by its standards.

Books of the Week

This report of current literature is supplemented by fuller reviews of such books as in the judgment of the editors are of special importance to our readers. Any of these books will be sent by the publishers of The Outlook, postpaid, to any address on receipt of the published price, with postage added when the price is marked "net."

Americans in Process: A Settlement Study. By Residents and Associates of the South End House. Edited by Robert A. Woods. Houghton, Mifflin & Co., Boston. 5×7½ in. 389 pages. $1.50, net.

Reserved for later notice.

Birds of God: Angels and Sundry Imaginative Figures from the Pictures of the Masters of the Renaissance. Selected for Children by J. B. Radcliffe-Whitehead. R. H. Russell, New York. 11×14 in.

An elaborately prepared portfolio of monotint reproductions of many famous pictures, intended to serve as an introduction to art-appreciation by children. The title given to the book is singular and not very apt.

Book of Meditations (A). By Edward Howard Griggs. B. W. Huebsch, 150 Nassau Street, New York. 5×7¾ in. 226 pages. $1.50. (Postage, 10c.)

Under this modest title is found high worth—the observations and reflections of a cultured mind at home and abroad, at home everywhere that art and books are found, in sympathy with human life in all its experiences, and Nature in all her moods. Professor Griggs's "Meditations" are as many-sided as the world that suggests them, and stimulating to all that is best in thought and conduct. It is a good book to have on the table, convenient for intellectual and moral refreshment in the chance moment of leisure.

Corot and Millet: With Critical Essays by Gustave Geffroy and Arsène Alexandre. Edited by Charles Holme. John Lane, New York. 8½×11½ in. $2 net.

There are no more inspiring names in the history of modern French painting than those of Camille Corot and Jean François Millet. We have recently seen in Sir Walter Armstrong's "Turner" the influence of certain regrettable qualities of personality on the work of a great artist; in this appreciation by MM. Geffroy and Alexandre we have a more encouraging and optimistic impression. As to landscape-painting, not even Turner himself so energized and broadened it as did the more admirable Corot, according to some enthusiasts perhaps the only worthy successor of Claude Lorraine: while as to genre work, what name may be put alongside Millet's? Why these things are so may be appreciated first of all, it must be owned, from such a comprehensive and acutely appreciative biography as Julia Cartwright's "Millet" (a new edition of which has just appeared); such a volume as the present, however, should also be in the hands of every lover of French painting. If the work cannot be read in the original, the American or English reader can take advantage of this sympathetic translation by Mr. Edgar Preston. The text is lavishly illustrated with reproductions of Corot's oil paintings, decorative paintings, charcoal drawings, and etchings, and with reproductions of Millet's crayon studies, pen drawings, drypoints, heliographs, woodcuts, oil paintings, and water-colors.

Correggio. By Leader Scott. (Bell's Miniature Series of Painters.) The Macmillan Co., New York. 4×6 in. 68 pages. $1.

Reserved for later notice.

Country Without Strikes (A). By Henry Demarest Lloyd. Doubleday, Page & Co., New York. 4½×7¼ in. 183 pages.

A timely cheap edition of the one important book on compulsory arbitration.

Economic Interpretation of History (The). By Edwin R. A. Seligman. The Macmillan Co., New York. 5×7¾ in. 166 pages. $1.50.

Reserved for later notice.

Economics of Forestry. By Bernhard E. Fernow, LL.D. Thomas Y. Crowell & Co., New York. 5×7½ in. 520 pages. $1.50, net.

Reserved for later notice.

Ethics: Civil and Political. By David Allyn Gorton, M.D. G. P. Putnam's Sons, New York. 5¼×8 in. 237 pages. $1.50, net.

Familiar Studies of Men and Books. By Robert Louis Stevenson. 2 vols. Illustrated. Herbert B. Turner & Co., Boston. 4¼×6½ in. 226 pages.

An extremely attractive edition of some of Mr. Stevenson's most characteristic papers; the two small volumes, printed from an unusually clear and effective type, on good paper, with illustrations, form one of the most convenient and altogether satisfactory editions of the essays, sketches, and studies which has yet appeared.

First Book of Forestry. By Filbert Roth. Illustrated. Ginn & Co., Boston. 5½×7½ in. 291 pages. 75c. (Postage, 10c.)

The early association of the author of this volume with the well-kept forests of Germany, his subsequent observations in the widely differing forest districts of our own country, and his years of experience in teaching the science, are all evidenced in a book which is not only elementary, but practical to every forester or student of forestry. The work is at once valuable as a text-book for schools, as a manual to be kept in country homes, and as a comprehensive work for any one's reading. Fortunately for the layman, the author expresses himself in non-technical and conversational language. The illustrations, while interesting, hardly match the value of the text.

Flowers of Song from Many Lands: Being Short Poems and Detached Verses Gathered from Various Languages. Rendered into English by Frederic Rowland Marvin. The Pafraets Book Co., New York. 7×10½ in. 138 pages.

The list of poetic fragments in this collection includes couplets, quotations, and somewhat longer selections from the German, French, Italian, Dutch, Spanish, Scandinavian, Greenlandic, Persian, Turkish, Arabic, Sanscrit, Phœnician, Assyrian, Latin, Greek, Chinese, Japanese, Ashanti, South Sea Islands, and Osage Indian literatures. Each specimen, says the collector, who in many cases is translator also, is characteristic of the soil and climate whence it was taken.

Fordwell Graham. By W. June Arlington. Allen, Lane & Scott, Philadelphia. 5½×8 in. 414 pages. $1.25.

His Excellency's English Governess. By Sydney C. Grier. L. C. Page & Co., Boston. 5×7¾ in. 367 pages. $1.25.

In vivid presentation of life in the Orient lies the fascinating quality of Mr. Grier's novels. The heroine, a young lady of beauty, culture, and high social standing, becomes the feminine guardian of Azim Bey, the ten-year-old son of Ahmed Khemi Pasha, and takes up her residence in that gentleman's harem. She is not welcomed by the Pasha's mother, that lady having a mind to poison the poor little Bey, who is by all odds the most entertaining person in the book. There is interesting exposition of zenana etiquette, gossip, bickerings, and jealousies, and an unusual view is given of its tyrannical hold over its lord and master, who had been commonly considered as the oppressor and never the oppressed. The relation of Turks, Armenians, and Kurds is pictured in not quite the ordinary way.

Historical Introductions to the Rolls Series. By William Stubbs, D.D. Collected and Edited by Arthur Hassall, M.A. Longmans, Green & Co. New York. 6×9 in. 534 pages. $5.

Reserved for later notice.

History of Over Sea (The). Done into English by William Morris. With Decorations by Louis Rhead. R. W. Russell, New York. 8×10½ in. 2[illegible] pages.

It is unfortunate that this very attractively made thin quarto was not published earlier. In its text, its illustration, and its binding it is emphatically a high-class holiday book, written in delightful English and sumptuously dressed. Of the class of prose writings to which "The History of Over Sea" belongs it is only necessary to say that they are written in that archaic English which Morris could use as well, probably, as any man of his generation, and that they represent the romantic side of his mind, his love of the mystical. The decorations for this volume are furnished by Mr. Louis Rhead, and the cover design is strongly suggestive of Persian book decoration.

How to Sing (Meine Gesangskunst). By Lilli Lehmann. Translated from the German by Richard Aldrich. Illustrated. The Macmillan Co., New York. 5½×7¾ in. 281 pages. $1.50, net.

To most readers the fact that this book was written by Mme. Lehmann, whose identification with a number of Wagner rôles has made her known almost personally to thousands, will give to it a real interest in spite of its technical character. A large part of the volume is taken up with careful and minute instructions, illustrated with diagrams. The reviewer cannot help thinking that Mme. Lehmann has attempted to do through the medium of the printed page what can be done only by oral instruction. Nevertheless, the general sanity that is apparent in her fundamental principles is worth the attention of those who cannot find the details in her work very illuminating. She has little respect for the singer who yields to "indisposition." "If you wish to sing only when you are in good form," she remarks, "you must excuse yourself ninety-nine times out of a hundred." Some of her advice she would probably modify, if not reverse, in dealing with pupils of certain temperament. On one point her views are worth quoting. She is roundly—and, in our view, soundly—opposed to the artificial division of the voice into three registers. "It will be much more correct," she suggests, "to call every tone of every voice by the name of a new additional register, for in the end every tone will and *must* be taken in a different position of the organs, although the difference may be imperceptible, if it is to have its proper place in the whole." A few anecdotes and reminiscences give a readable quality to

the earlier pages. Behind the entire book is the authority of one whose mastery of the art of singing in the song recital as well as upon the operatic stage places her among the foremost singers of our time.

Hudson River (The): From Ocean to Source. By Edgar Mayhew Bacon. Illustrated. G. P. Putnam's Sons, New York. 6½×10 in. 590 pages. $4.50, net.

Mr. Bacon, the author of this handsomely made volume, has long been a devout student of the scenery, history, and legends of the region through which the Hudson River flows. His "Chronicles of Tarrytown," published some time ago, was the first fruit of his investigations, and bore evidence of his qualification, by reason not only of familiarity with the material with which he dealt but of vital interest in it, to become the recorder and historian of the Hudson River country. For his book is both a record and an impression. He describes, in effect, nearly the whole course of the river; but he does it in connection with its chief historical points and its personal associations. He conveys the physiognomy of the country, so to speak; he tells its early history in an informal and engaging fashion, and he associates it with the men who have lived near it, and with the events which have taken place at its different points. Beginning with the exploration of the river by the Englishman Hudson, in the Dutch ship Half Moon, under the authority of the Dutch East India Company, he traces the gradual ascent of the river and its slow settlement along either bank from New York to Troy. Disclaiming any attempt to make the historical narrative continuous, Mr. Bacon has so woven together the different chapters in the settlement of the river country and the incidents connecting it with different localities as to make a story which has unity if not continuity. He writes not only of the oldest New York, but of the newest New York; and the interest of his sketch proves that he has an eye for the many artistic effects about the metropolis which are often overlooked. He gives a very interesting account of the festivals and pageants which have taken place in New York. He describes the early settlers in the Hudson Valley; the early navigation, with the great changes which were introduced with the appearances of steam upon the river. He groups the incidents and history of the Revolution; he has two delightful chapters on "The Land of Irving" and the literary associations of the Hudson; he writes of West Point, of the old Dutch towns, and of many other aspects of his subject, not too heavily, and with a strong infusion of tradition and anecdote, much of which will be new to most readers; for Mr. Bacon has evidently put behind the work thorough examination of the sources of local history. The value of this handsome quarto does not depend solely on the attractiveness with which Mr. Bacon has invested the whole subject; it is a kind of foot-note to the more conventional histories, because it throws light upon the life and habits of the earliest settlers. It is a study in Dutch civilization in the New World, severe enough in intention to be accurate, but easy enough in temper to take in a great deal of humor, and to comment upon those characteristic customs and habits which, while they escape the attention of the formal historian, are full of significance. The book contains more than a hundred illustrations—reproductions of photographs, engravings, and drawings by Mr. Bacon, and with some very interesting reproductions of paintings by Boynton, Weir, Casilear, and Seavey. Each volume is accompanied by sectional maps of the river in a slip which will be of value to those readers who like to follow with the eye the country about which they are reading. The book is eminently readable in style. Its only serious defect is its uncomfortable weight in the hand.

Introduction to the Talmud. By M. Mielziner, Ph.D., D.D. Funk & Wagnalls Co., New York. 5¼×8 in. 297 pages. $2, net.

As Christianity in its formal aspect has rested more on the great doctors of the Church than on the New Testament, so has Judaism rested on the great doctors of the Synagogue more than on the Old Testament. This is still true of Judaism, though there have been earnest pleas lately for that return to the ancient Scriptures which is so significant of the reforming Christianity of to-day. But to understand Judaism as it is, and why it is what it is, one must know something of the Talmud, just as one who would understand certain aspects of Christianity must know something of the early Church fathers and of the fathers of Protestantism. The large attention now given to Biblical study has drawn increased attention to the Talmud for its value in questions of Biblical exegesis and criticism. It is, indeed, a vast mine of learning and of speculation, much of it antiquated, but also with much precious metal embedded in unserviceable material. Professor Mielziner has facilitated the comprehension of an intricate subject by producing the first comprehensive work of its kind in our language. It is enriched by a copious bibliography of works in special departments of Talmudic lore. Readers who have some knowledge of Hebrew will find it more valuable than others.

Letters to Washington and Accompanying Papers. Vol. V., 1774-1775. Published by the Society of the Colonial Dames of America. Edited by Stanislaus Murray Hamilton. Houghton, Mifflin & Co., Boston. 6×9 in. 288 pages. $5, net.

Life and Repentaunce of Marie Magdalene (The). By Lewis Wager. (The Decennial Publications, Second Series. Vol. I.) The University of Chicago Press, Chicago. 6×9 in. 91 pages.

Manual of Zoölogy (A). By Richard Hertwig. Translated and Edited by J. S. Kingsley. From the Fifth German Edition. Henry Holt & Co., New York. 5⅞×8½ in. 704 pages.

In a scientific aspect this is a splendid work. Professor Kingsley has edited, with modifications permitted by the author and with added illustrations, the treatise which holds in German schools the foremost place in its field, and has thus adapted it to the requirements of American students beginning the subject. Professor Hertwig is more admirable as a scientist than as a philosopher; perhaps it is well that he very seldom philosophizes in the

present work. He confesses frankly enough that the secret of life is inscrutable, the goal sought by science in the physical basis of life is "indiscernibly distant," yet he does not hesitate to approve "the attempt to explain life as the summation of extremely complicated chemico-physical processes." These processes are doubtless essential to the manifestation of life, but it is quite a jump to infer from this that their summation is essential to the existence of life. These processes go on destructively in a dead organism. What is it that sets them going constructively in a living organism?

Memorable Places Among the Holy Hills. By Robert Laird Stewart, D.D. The Fleming H. Revell Co., New York. 5×8 in. 250 pages. $1, net.

Availing himself of the explorations of recent travelers and discoverers as well as of his own, Dr. Stewart has made a book of real interest to readers of the Bible.

Perseus and Andromeda. Retold by Richard Le Gallienne. Illustrated. R. H. Russell, New York. 5½×8½ in. 54 pages.

A free translation from Ovid, but amplified and treated in a poetic spirit. Reproductions of the Vatican Perseus, of Cellini's Perseus, of Burne-Jones's Medusa, and of the Vatican Minerva make interesting illustration.

Reminiscences, Musical and Other. By Fanny Reed. Illustrated. Knight & Millet, Boston. 5×8 in. 158 pages. $2.50.

The persons, eminent mainly in artistic circles, who are the subjects of the various chapters, are widely various, as may be indicated by the names of Liszt, the Marquise de Bloqueville, Coquelin, and Munkacsy. It is not easy to understand why so much that is merely biographical and appreciative should be included under the title Reminiscences. Scattered through the volume are a number of interesting and characteristic anecdotes.

Sinless Christ (The). By George Tybout Purves, D.D., LL.D. (The Presbyterian Pulpit, No. I.) **For Whom Christ Died.** By William R. Richards, D.D. (The Presbyterian Pulpit, No. II.) The Presbyterian Board of Publication, Philadelphia. 5×7½ in. Per vol., 75c., net.

Presbyterians have begun to do what Unitarians have long been doing, but with this difference: instead of frequently publishing single sermons of representative preachers, they are to issue from time to time small volumes, each containing eight sermons by the same author. The present volumes begin the series. Of their authors, Dr. Richards, recently succeeding Dr. Babcock in the Brick Church, New York, is less widely known; but for freshness and power it would be hard to find better sermons than he has presented here.

Socialism and Labor, and Other Arguments Social, Political, and Patriotic. By Rt. Rev. J. L. Spalding. A. C. McClurg & Co., Chicago. 4⅛×7 in. 225 pages. 80c., net.

Son of Destiny (A): The Story of Andrew Jackson. By Mary C. Francis. The Federal Book Co., New York. 5¼×8 in. 450 pages.

A badly written historical novel.

Spain and Her People. By Jeremiah Zimmerman, LL.D. Illustrated. George W. Jacobs & Co., Philadelphia. 5½×8½ in. 350 pages. $2, net.

Dr. Zimmerman can hardly congratulate himself on possessing a particularly good literary style, but he can feel well satisfied at having given to the world much interesting and valuable information concerning Spanish history politics, and society. Actual conditions in Spain from the actual traveler's standpoint may be obtained with greater color and vividness from such works as Miss Bates's "Spanish Highways and Byways," Mr. Jacacci's "On the Trail of Don Quixote," above all from Baron Davillier's "L'Espagne." The chief merit of the present volume is in its explanation of recent conditions: such as the appallingly phlegmatic national spirit in the face of the loss of a hundred thousand men who fell during the recent insurrections and during the more recent Spanish-American war; and such as the loss of Spain's great colonial possessions, involving the abandonment by a hundred thousand colonials of their former homes and their return to the mother country. Yet there is much valor, probity, and generosity in the individual Spaniard, and these qualities as indicated by our author are as admirable as ever. The illustrations are interesting and would well illustrate the text had they been better placed. The picture of the Cordova mosque looks belated, twenty-five pages after the author had finished his description of Cordova and was claiming his reader's attention with Madrid and the Escorial; in like manner, an illustration of a Madrid square finds its space in the chapter on Segovia, while not until we are in the midst of the chapter on Saragossa are we favored with a view of the Escorial.

Text-Book of Nursing (A): For the Use of Training Schools, Families, and Private Students. By Clara Weeks-Shaw. (Third Edition. Thoroughly Revised and Enlarged.) Illustrated. D. Appleton & Co., New York. 5×7½ in. 397 pages. $1.75

This book has stood the test of actual use, and has been found clear, complete, and admirably adapted for precisely the uses indicated in the sub-title.

Theism *et als.* By the Rev. Charles Caverno, A.M., LL.D. The Abbey Press, New York. 5×8 in. 246 pages.

Dr. Caverno writes clearly and incisively. Those who have met with his occasional articles on theism and other topics related to it, for which his present title employs the abbreviation used by lawyers, will welcome their collection in this volume. To him intelligence, ethics, and æsthetics are inseparable from theism. The scientist, the moralist, the artist, if whole-minded, must be theists. His chapter on "The Unity of Moral Dynamism" is a most desirable broadening of the popular conception of the agency of the Holy Spirit, which Dr. Caverno recognizes in the primary movings of untutored conscience as really as in the aspirations of the saint.

Under the Pine-Tree Flag. By Willis Boyd Allen. Illustrated. The Pilgrim Press, Boston. 5×7½ in. 274 pages.

With Washington at Valley Forge. By W. Bert Foster. Illustrated. The Penn Publishing Co., Philadelphia. 5×7½ in. 369 pages. 90c., net.

The young hero is with the Revolutionary army at Brandywine and Valley Forge. His adventures are told in a way that will probably interest boys.

A Variety of Soups

on your pantry shelf will meet perplexing emergencies.

LIBBY'S CONCENTRATED SOUPS

are the best that can be made from the best stock, and better than can be made at home.

Simply add boiling water and they are ready to serve. Saves trouble, expense, and waste of trying to make good soups in small quantities.

Try them once and you will always use them.

Ten cents a can, enough for six portions, at your grocer's. Our little book "How to Make Good Things to Eat," is given away; tells how to serve all of

A Fight for the City

The Story of the part borne by District Attorney Jerome and his associates in the great contest which overthrew Tammany in New York City. Written for The Outlook by Alfred Hodder, Private Secretary to Mr. Jerome

PART ONE

The Hunting of John Doe

STOP! I SAY, STOP!

YOUR GOAL IS REACHED

You need not go another step to make thousands on a sma investment of $10 down and $6 a month.

Cease your hunt for opportunities. *You have found the greatest them all* ***RIGHT HERE!***

The Millionaire's Security—*Real Estate in Greater New York*—Shall be YOUR securit

---

Ten dollars down and $6 per month until you've paid us $510 will buy a choice lot within 35 minute of New York's famous sky-scrapers, in the wondrously fast-growing Brooklyn section—the district which RUSSELL SAGE said (these are his exact words as published in the *New York World* September 28th last): "BROOKLYN IS GROWING AT THE RATE OF 75,000 PEOPLE YEAR." Then he advised as follows: "*Young man, buy Real Estate, especially in the outlyin boroughs, and then work hard at your usual avocation. Your Real Estate purchases will mak your old age comfortable.*" Wise words, based on personal experience, for Russell Sage is witho doubt one of the world's greatest investors and financiers, and his reputed wealth is $100,000,000.

Your money is absolutely safe with us, as twenty National Banks, Bradstreet's and Dun' Commercial Agencies, and over 30,000 customers who have dealt with us during the last fifteen year will tell you. Investments aggregating $3,461,000 during the past year represent the endorsement o our proposition by over 4,000 individual investors.

Remember, our offer also carries a free deed in case of death, a non-forfeiture agreement, a guar anteed increase of **25 per cent.** within one year from November 1, 1902, **a Free Round Trip t New York** (East of Chicago or like distance), the highest class of park-like improvements free, **you money back with 6 per cent.** interest if not found as represented.

Let us at least tell you the whole grand story in detail—then

COME TO NEW YORK AT OUR EXPENSE TO PERSONALLY VERIFY EVERY WORD WE'VE SAID

You simply cannot afford to ignore our offer. We know what we have, and the thousand who have invested with us know. You **should** know, and **can** know by filling out the subjoined coupo and mailing it to us. It costs 2 cents and a minute's time. **Isn't it worth while?**

WOOD, HARMON & CO., Dept. D14, 257 Broadway, New York

"There is no doubt the property offered by Wood, Harmon & Co., in the 29th and 31st Wards, represents one of the best investments a man of limited income can possibly make within the corporate limits of Greater New York. It can be said without hesitancy that Wood, Harmon & Co. are perfectly reliable, and are worthy the fullest confidence of the investor, whether he resides in ... York or any other ... d States."

The Outlook is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The first issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

Price.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

Postage is Prepaid by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila Samoa, Canada, and Mexico. For all other countries in the Postal Union add $1.56 for postage.

Change of Address.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

Discontinuances.—If a subscriber wishes his copy of the paper discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

How to Remit.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of THE OUTLOOK COMPANY. Cash should be sent in Registered Letter.

Letters should be addressed:

THE OUTLOOK COMPANY

287 Fourth Avenue, New York

Copyright, 1903, by The Outlook Company. Entered as second-class matter in the New York Post-Office.

MENNEN'S

BORATED TALCUM TOILET POWDER

Delightful After Bathing, A Luxury After Shaving

A positive relief for **Chapped Hands, Chafing,** and all afflictions of the skin. Removes all odor of perspiration. Get **Mennen's** (the original), *a little higher in price, perhaps, than worthless substitutes, but here is a reason for it.* Sold everywhere, or mailed for **25** cents.

Sample free. GERRARD MENNEN CO., Newark, N. J.

A thick suds of Ivory Soap in lukewarm water and a soft cloth will restore the polish to parlor furniture with very little effort and not the least chance of harm.

The vegetable oils of which Ivory Soap is made fit it for many special uses for which other soaps are unsafe or unsatisfactory.

The Anti-Trust Programme

Apart from the action of the House in passing the General Staff Bill, which we have so often warmly commended, by a vote of 153 to 52, and the debate in the Senate on party responsibility for the tariff on coal, the interest of both houses last week was practically absorbed in the new legislation proposed for the regulation of trusts. At the very beginning of the week, Senator Hoar, the Chairman of the Judiciary Committee of the upper house, introduced his well-considered and unexpectedly radical bill, and the day following Attorney-General Knox, acting upon the requests he had received from the Senate and House Judiciary Committees, outlined the legislation he believed essential to cope with the evil of industrial monopoly. Were it not for the overshadowing importance of Mr. Knox's letter setting forth the programme of the Administration, we should describe in detail Senator Hoar's bill and outline his elaborate speech in support of it. At present, however, we shall only note that the bill applies to all corporations selling their products in other States than those in which they are chartered, establishes publicity for all their operations, and forbids attempts to break down competitors by lowering prices in specific localities or by binding purchasers not to buy of competitors. The programme of Attorney-General Knox is more limited in its scope, but proceeds strongly along the line of dealing with the worst evils first and establishing in the courts the right of Congress to go further as occasion demands. The Attorney-General starts out with the declaration that the end sought is not the destruction of combinations, but their regulation and the correction of "the tendency toward monopolization of the industrial business of the country." In his judgment, he says, monopoly would be impossible in this country, where abundant capital is within the reach of capable and enterprising men, if competition were assured a fair and open field. The advantages of production on a colossal scale, he points out, are often more than counterbalanced by "the close economies possible through direct, personal, interested management." "If the law will guarantee to the smaller producer protection against piratical methods in competition, and keep the highways to the market open and available to him for the same tolls charged to his powerful competitor, he will manage to live and thrive to an astonishing degree." With this view of the situation, he would restrict anti-trust legislation to the securing of equal freight rates and the prevention of what he aptly calls "predatory competition."

To Secure Equal Freight Rates

In order to secure equal freight rates the Attorney-General recommends that legislation be directed against those who receive as well as those who give the advantages of discrimination, and that the legislation against the recipients "take the form of penalizing the transportation of goods produced by the guilty parties, and the Federal Courts be given power to restrain such transportation at the suit of the Government." The Attorney-General points out that, "whatever Congress may have designed" in the Inter-State Commerce Act, that act "as construed by the courts" cannot easily be employed to punish shippers for participating in unjust discriminations. "The courts have held," he says, "that to constitute an unjust discrimination it is necessary to prove that at the time the unlawful lower rate was being granted to the favored shipper the higher lawful rate was imposed against another shipper on like commodities be-

tween the same points." In many cases the person unlawfully favored has become the only shipper between the two points, and the whole provision is rendered hopelessly ineffective. Similarly, the penalties imposed by the act against the carriers granting the discriminating rates "have been held by the courts not to be applicable to any carrier that is an incorporated company." Only the agent who makes the unlawful concession can be punished, and he "is usually the only person by whom it can be ascertained that the rebate has been paid, and when he has testified in relation to the matter he has thereby obtained amnesty from prosecution." Attorney-General Knox would have the law changed so that the incorporated companies and the beneficiaries could both be punished, and the right of the courts to enjoin such practices be made certain. He would also have the law provide that the published rates of railroads must in all cases be adhered to, and that where traffic is transported at less than those rates all the participants should be punished.

❀

To Prevent "Predatory" Competition

Thus far the Attorney-General's recommendations relate only to the discriminations practiced by the railroads through which the industrial trusts have been favored. He proposes an additional provision directed against the discriminations which the industrial trusts themselves practice when they "sell below the general price of a commodity in particular localities, or otherwise in particular localities wantonly seek to destroy competition." The products of such combinations he would exclude from crossing State lines. In order to get all the information necessary to correct trust abuses, he recommends the creation of a new commission charged with the duty of investigating the operations of corporations "engaged in inter-State commerce," and armed with the power to require witnesses to testify and to produce the books, papers, contracts, and documents bearing upon the points investigated. Finally, in order to secure prompt decisions from the Supreme Court upon cases arising under the anti-trust laws, the Attorney-General asks that his department be given the same authority to advance such cases to their final hearing that the department already has to advance certain other classes of cases of less public moment. What the Attorney-General particularly desires, of course, is a final decision from the Supreme Court upon the constitutionality of an act of Congress debarring from inter-State commerce the products of corporations attempting to monopolize trade by plainly unreasonable acts. If the Supreme Court decides that Congress has this power, the way will be open to develop anti-trust legislation so as to require the same publicity from oil, steel, and other manufacturing trusts that this act requires from the railroads that are engaged in inter-State transportation. The present programme does not claim to be complete. It is distinctively a plan for protecting producers against unfair competition from the trusts, rather than for protecting consumers against unfair prices; yet, as the Attorney-General says in conclusion, the adoption of the legislation proposed "will make a long first stride in advance."

❀

The President and Negro Office-Holders

The action of President Roosevelt in sending to the Senate the nomination of Dr. Crum, a colored physician of Charleston, as Collector for that port, and the closing of the post-office at Indianola, Miss., because the postmistress, a colored woman, was threatened with violence, have called forth wide discussion throughout the South, and some violent expressions of opinion. In December, in answer to the protests of several citizens of Charleston against the appointment of Dr. Crum, President Roosevelt stated his position in a few words:

> I do not intend to appoint any unfit man to office. So far as I legitimately can, I shall always endeavor to pay regard to the wishes and feelings of the people of each locality, but I cannot consent to take the position that the door of hope—the door of opportunity—is to be shut upon any man, no matter how worthy, purely upon the grounds of race or color. Such an attitude would, according to my convictions, be fundamentally wrong. If, as you hold, the great bulk of the colored people are not yet fit in point of character and influence to hold such positions, it seems to me that it is worth while putting a premium upon the effort among them to achieve the character and standing which will fit them.

The Outlook sees no reason to change its opinion that the President's attitude on

the general question was right, and one which will commend itself in the long run to the best people of the South. The reaction of the South against the injustice and misery of the reconstruction period was inevitable; and it is not surprising that it has gone so far as to affirm that under no circumstances shall any colored man be elected to hold any office. It is clearly impossible for the President of the United States to accept such a principle as this; to discriminate against the negro simply because he is a negro would be inconsistent, not only with the fundamental principles of the Republican party, but with the fundamental conceptions of a republican government. Mr. Roosevelt, although a man of fortunate conditions as regards social and educational opportunities, is pre-eminently an exponent of the American doctrine that a man shall be treated as a man, no matter what his position, his religion, or his color. To bar a whole race from holding any position under the United States Government is so plainly a flat contradiction of the spirit and principles of that Government that to state the proposition is to refute it.

❀

The Race Question The race question in the South involves such great difficulties, and demands for its solution so much patience, knowledge of actual conditions, and such far-seeing statesmanship, that it ought to be the policy of the United States Government, as it is certainly now the sentiment of the North, to aid the thoughtful men of the South in their endeavor to put the relations of the two races on grounds of justice, mutual respect, and law. The Outlook is in pronounced sympathy with the best men of the South, who are dealing at first hand with as appalling a problem as any man ever had to face. It believes that these men ought to be aided in every possible way; it recognizes the existence of the inflammable material in many parts of the South which occasionally breaks forth in acts of violence and in incendiary sentiments; and it believes that the Government ought, so far as possible, to co-operate with those men, who are growing in numbers in every State, who are endeavoring to help the negro to better educational and to larger industrial opportunities, leaving to the future the settlement of his political position when he shall have secured a foothold as a citizen. As a rule, a Federal officer ought to be *persona grata* in the community in which he holds office, and there are very few communities in the South in which it would be wise, either for the whites or for the blacks, that a negro should be appointed to a Federal position. There is no inconsistency between the conviction that the United States Government cannot exclude from official position a negro because he is a negro and the conviction that, at present at least, negro appointments in the South ought to be few and made with great good judgment. In the Indianola matter it is difficult to see how the President could have taken any other action; that seems to have been simply a recrudescence of race prejudice in its worst form. Nothing has been urged against the postmistress except the fact that she was a negro. She had held office for some time, and, as far as can be learned, had discharged her duties to the satisfaction of the community; she does not appear to have been in any sense an offensive person. Under these circumstances, the endeavor to drive her out of her position by threats of violence was cowardly and ought to have been met by the President as it has been met; and this, we believe, will be the sentiment of the best people of the South.

❀

Reciprocity Legislation by the "Third House" One of the most important legislative events in Washington last week took place, not in Congress, but in the parlors rented by the American Beet Sugar Association, where, by a vote of 3 to 2 (or 12 to 2, counting the proxies held by Mr. Oxnard), resolutions were adopted withdrawing opposition to Cuban reciprocity, provided the proposed twenty per cent. reduction in the tariff on Cuban goods is strictly limited to a five-year period. If this limitation is securely pledged them, the Association advises its constituents that they have less to lose from the twenty per cent. reduction than from the continuance of the agitation in favor of helping Cuba. At the same time, however, the Association declares its

inflexible opposition toward the proposed tariff concession to the Philippines granting the products of the islands a reduction of seventy-five per cent. instead of twenty-five per cent. of the Dingley rates on imports from foreign countries. Although this concession has been sanctioned unanimously by the House, it is feared that the beet-sugar opposition may defeat it in the Senate. The chief obstacle to the adoption of the Cuban reciprocity treaty now lies in the opposition of the cane-sugar Senators from Louisiana. Although more than two-thirds of the Senate are ready to vote for the treaty, a few bitter opponents may keep the vote from being reached at this short session.

❀

The Duty on Coal

The scarcity of coal still continues to be the cause of a great deal of public suffering and inconvenience. Not only are factories being in some cases shut down and in some cases run upon half-time, but it is reported that in some communities coal is being sold to those consumers only who have a physician's prescription—that is to say, those who can prove that the coal is absolutely necessary to preserve health. Some of the transatlantic steamers which sail from the port of New York have been delayed in their departure from lack of coal. There is every indication of a widespread and rapidly increasing demand for the abolition or suspension of all duty on coal for a long enough time at least to relieve the present crisis. The Legislature of Rhode Island has passed a resolution demanding such suspension from Congress. Senator Lodge has introduced a resolution into the Senate, and Representative McCall a bill into the House, providing for the suspension for ninety days of all duty on coal, and for the suspension of duty on Canadian coal beyond that time, provided the Dominion Government shall enter into reciprocity in this respect. The action of the Rhode Island Legislature and of the Massachusetts Senator and Representative makes the question now a non-partisan one; no protectionist, with Rhode Island and Massachusetts earnestly working for the abolition of coal duty, can say that the demand comes simply from those who wish to attack the protective system. Senator Lodge has, we are glad to say, apparently changed his opinion since last autumn, when he opposed free coal on the ground that it would endanger the unity and logic of protection of American industries. The absurdity of saying that a man is protecting himself when he freezes to death because he will not use the coal offered to him by his neighbor would be amusing if it were not exasperating at such a time of public suffering.

❀

Crimes Against Non-Union Workers

Day after day last week the Coal Commission heard the testimony of a score of non-union workmen who had been the victims of cruelties of every description because they remained at work or went to work after the strike had been declared. The boycotting and assaults testified to before the Commission were in some respects less revolting than the petty persecutions and terrorism from which no physical injury resulted. Take, for instance, the case of Thomas Washaiski, of Hazleton, a clerk for Pardee & Co., who was married on September 16, and whose experiences of that day, as told to the Commission, were summarized in the press despatches as follows:

> On the night of the wedding a small crowd gathered at the Catholic Church, and as the bridal party entered the edifice Washaiski and his bride were called "scabs." Coming out after the ceremony, he was assaulted by the waiting crowd, which had greatly increased. The driver of the carriage was not permitted to take the couple home, and the witness sought refuge in the parochial residence, and the bride was escorted home in a trolley-car by friends. While in the parochial residence the crowd remained in the vicinity, calling the bridegroom vile names and yelling "scab" at the rector of the church because he had performed the ceremony. Later on, the witness said, he managed to get away from the house, and spent the night in the colliery, being afraid to go to his home. The bride spent an anxious night, as some unknown persons came to the house and threw stones at the place.

In one case of assault testified to before the Commission the victim stated that his assailants were two union men, who had been tried and convicted for the crime. Commissioner Parker inquired whether they had been expelled from the union, and the head of the local union, on being brought upon the stand, testified that he did not know whether they had

been or not, but that the unions and individual strikers had done all in their power to disperse crowds and help keep the peace. Chairman Gray sharply reprimanded the witness for his apparent readiness to wait for convictions by the civil authorities before disciplining his men. "Do you think," he exclaimed, "that you can have effective discipline unless you make investigations yourself and bring the men up and punish them in some way? I ask you, as a member of the order and as a man who would be glad to see your order come up out of the mire and the clouds that are around the baser parts of it into the sunlight and into the air of free government and a free country." This remark of the Chairman stirred Mr. Mitchell, who came to the defense of his union by declaring that the union had no right to expel men for crimes of which they had not been convicted, and protesting against the assumption that the union organization was responsible for the acts it had been unable to restrain. He contended, as had his attorneys, that if the union was on trial for the outrages, there should be some evidence connecting the union with them. Mr. Mitchell at one time took part in the cross-examination of a witness—the Sheriff of Lackawanna County—who testified that the union in several instances had rendered him material help in preserving order. General Wilson, of the Commission, in cross-examining the same witness, brought out the fact that the deputy sheriffs employed were not paid by the county, but by the coal companies. This explanation surprised Chairman Gray, who said most justly: "I am not familiar with such an un-American law. When the county or State relinquishes the duty of maintaining and protecting life and property and keeping the peace, then they are open to criticism." The result of the week's testimony, however, was extremely hurtful to the prestige of the union, which had plainly failed to instill into great numbers of its followers the conviction that it as well as they were discredited by outrages against its opponents. The Outlook believes that the greatest enemy that the trades-unions have to face to-day is not the criminal aggressions of capital, but the criminal acts of their own members.

The Erie Canal In his annual message Governor Odell, of New York, expresses for the first time since his re-election his views regarding the improvement of the Erie Canal. He explicitly reaffirms his "belief in the thousand-ton barge plan." He acknowledges, however, that the plan for the lake route (described in The Outlook for December 20), which he has heretofore favored, is, in the judgment of those who have given the matter study, impracticable. He therefore concludes in favor of the enlargement of the present route, with some variation. Though he thus simplifies the question by putting the weight of his influence on the side of the route which is most generally favored, he introduces a new complication by making an estimate of the cost far in excess of former estimates. He declares that the improvement will involve the expenditure of $255,000,000. If Governor Odell were opposed to all canal improvement, he could have taken no more effectual means to discourage the people of the State from undertaking it than by suggesting the possibility of such enormous expense. It makes the project appear to require a vaster outlay than the Panama Canal. The fact is that this estimate includes interest for fifty years and a twenty per cent. margin for error, and allows also for the deepening of the Champlain Canal to twelve feet. Inasmuch as estimates upon which Governor Odell bases his figures already include a ten per cent. margin for contingencies, and interest for eighteen years, and as the deepening of the Champlain Canal is no essential part of the project, State Engineer Bond's estimate of $123,200,000 seems much nearer the probability than Governor Odell's. At any rate, there is no such reason for dismay at the bigness of the undertaking as the message of Governor Odell would seem to imply.

❀

The Franchise Tax Assailed Apart from his recommendation of a costly canal and his argument against it, the most striking feature of Governor Odell's message is his plan for the abandonment of the franchise tax law adopted under Governor Roosevelt's administration. This law, it will be recalled, simply provided that the value of

municipal franchises should be assessed like real estate. Governor Odell reports that "some corporations can bear this burden without serious results following. But, as is well known, the continued increase of street railroad traffic and the demands for lighting, water, telephone, and other public utility facilities have perhaps brought into existence many corporations which cannot bear the excessive burden which is now imposed under the present law." In our view, this is as bad reasoning as has often appeared in a Governor's message. The franchise tax imposes no burden upon corporations which merely earn a fair rate of interest on the capital actually invested. In such cases the franchise has given no additional value to their property, and the tax upon it amounts to nothing. It is only where the franchise gives to the securities of a corporation a market value far in excess of the capital invested that the franchise tax becomes important. To say that any corporation cannot afford to pay taxes upon the surplus value given to its property by public privilege is preposterous. The argument, furthermore, is made worse by the lines calling attention to the recent great increase in the demand of the public for the services of municipal monopolies. Had there been a decrease in these demands, there would have been an argument for tax reduction, but the increase is an argument for increased taxation. The Governor's argument that the franchise tax will yield less than anticipated does not affect the justice of the law, and only further weakens the force of his protest against the burdensomeness of the new law. The Governor's argument that the State, and not the municipality, ought to receive the tax on the value from municipal franchises only needs to be stated to expose its weakness. His final contention, however, that taxes on the earnings of municipal monopolies would be fairer than the tax on the value of their property does demand a word of comment. Taxes on earnings cripple corporations not yet paying their running expenses, and place unjust burdens upon new enterprises. Taxes on market values fall but lightly upon corporations making small profits, and rest chiefly upon those holding monopoly privileges. Furthermore, and finally, the assessment of market values is the method applied in the taxation of the property of individuals, and all who care for equal taxation wish the same method applied to the taxation of corporations. It is greatly to be regretted that Governor Odell's disappointing recommendations upon canals and taxation have practically withdrawn public attention from his excellent recommendation of legislation against combinations to prevent enlistments in the National Guard. Such combinations are clearly against public policy, and combinations against public policy, whether of labor or capital, should be prohibited by the public.

❁

"Catering to the Better Element"

The municipal situations in the several important cities of Pennsylvania present, as usual, some extraordinary features. In Philadelphia the Republican machine, after four years of almost uninterrupted victories, has made an important and unexpected concession to public opinion in the proposed nomination of District Attorney John Weaver for Mayor, who has more than met reasonable expectation in the discharge of his duties and has earned the commendation of the independents. It seems strange, but it is none the less true, that the Republican party organization in Philadelphia should be able to make a nomination for Mayor which the Municipal League would support; and yet this is just what has happened. The League has decided to recommend that if District Attorney Weaver shall be made the Republican candidate for the Mayoralty, he should be supported by the Municipal League. In making this recommendation it was declared that the League was not unmindful of the fact that Mr. Weaver's nomination will be due to methods and influences which are radically wrong. It is manifest, however, that under existing conditions in Philadelphia an attempt to oppose the candidate on this ground alone would be unwise. Mr. Weaver has made an admirable record as an honest and energetic District Attorney, and this is certainly a reason for believing that as Mayor of Philadelphia he will appreciate his splendid opportunities to redeem the character of the city government by securing the enforcement of the laws and protecting the interests of

the citizens. In Pittsburg the defeat last fall of the reformers and honest Democrats has led to the revival of the old Municipal League, which will make a strong effort to redeem the city from the hands of both groups of spoilsmen. In Harrisburg, where so great an advance was scored a year ago, the Municipal League proposes to make an active fight for the election of decent men, as it finds that many of the regular party men who sailed into office in the reform tide have lost their keen interest in the Municipal League end of it and are more concerned in playing politics. In the meantime, against rather heavy odds, Mayor Vance McCormick is making commendable progress, rooting out old abuses and establishing the city's affairs on what may be called a business basis.

❀

Praxedes Mateo Sagasta Last week Spain suffered the loss of one who, since the death of Cánovas del Castillo, has, not without justice, been called the one great Spanish statesman. Praxedes Mateo Sagasta was a Castilian; he was born seventy-five years ago, and was educated as an engineer, but he early turned to politics as a life-work. In 1854 he was elected to the Cortes, or Parliament, but, on account of his part in the insurrection two years later, was obliged to take refuge in France. When he was allowed to go back to Spain, he returned temporarily to his old profession and became Professor in the Madrid School of Engineering, at the same time editing the radical-progressive "Iberia." In this latter capacity he continued his bold proclamation of Liberal principles, thereby bringing himself into disfavor with the Ministers of Isabella II. During the insurrection of 1866 he was again obliged to flee to France, but, on the overthrow of the despotic Queen (1868), returned to Spain, and, the constitutional guarantees being suspended, when General Prim formed a provisional government, Sagasta, as Prim's "familiar spirit," was appointed Minister of Public Works, subsequently becoming Minister of the Interior, and finally Minister of Foreign Affairs, acting in the last-named capacity throughout the critical year of 1870. Colonel John Hay, now Secretary of State at Washington, was then an attaché of our Legation at Madrid, and thus describes Sagasta:

> He has a dark, wrinkled face, small, bright eyes, the smile and scowl of Mephistopheles. He is a most vigorous and energetic speaker, but so aggressive and pungent in his style that he rarely fails to raise a tempest in the languid House when he speaks at any length. He has a hearty contempt for the people and a firm reliance in himself—two important elements of success for a Latin statesman.

On the accession of Amadeus of Aosta, in 1871, Sagasta entered the new Cabinet, an indication that by this time his radicalism had become cooled. He certainly became the antagonist of Ruiz Zorilla, that radical of radicals; the latter's election to the presidency of the Cortes was a bitter pill to Sagasta, forcing his resignation from the recently assumed Premiership. Amadeus refused to accept the resignation, however, and the Cortes was dissolved. In the subsequent elections the Ministry obtained a large majority, it is true, but Zorilla succeeded so well in showing that the elections were secured by corrupt practices that, after a few months, the Premier was again driven from power. When, in 1873, Spain found herself again a republic, Sagasta was once more Minister of Foreign Affairs and Prime Minister, and remained so until the accession of Alfonso XII., a year later. The Premier who had served Marshal Serrano would not give his adhesion to the new régime until the King, who was destined to reign eleven years, had been six months on the throne. In 1881 Sagasta and Martinos Campos organized the present Liberal party, which overthrew the Conservatives and came into power. From this time forward Spain knew many vacillations between Conservative and Liberal Cabinets, which were invariably headed now by Cánovas, now by Sagasta.

❀

Sagasta and America The Spanish Cabinet change of 1897 seemed the most important of all; it proclaimed Spain's last effort to retain (and now by a broad policy which might have been successful earlier) her hold upon her colonies in general, and upon Cuba in particular. Sagasta assumed the Premiership on the distinct policy of the pacific[illegible] through autonor

only by all the Spanish Conservatives, but even by many Spanish Liberals. The Premier's first act was to recall General Weyler, the infamous "butcher" Captain-General of Cuba, and to appoint as his successor the humaner and high-minded General Blanco; but in everything Sagasta left no opportunity unexhausted to avert the coming war. Even he was powerless in the matter; and when the Manila disaster capped the climax, he was forced to resign. The sympathies of the courageous Queen Regent, however, were firmly enlisted upon his side; and, largely through her aid, Sagasta was successful in forming a new Cabinet. He now abandoned his former temporizing tactics and declared that the war should be fought to the bitter end, though he knew better than any one that from the start Spain's cause was hopeless. When the war was over, perhaps the most difficult problems ever faced by any statesman had to be met by the Spanish Premier. It is true that he was helped by the surprisingly phlegmatic national spirit in the face of the loss of tens of thousands of men and of vast colonial possessions. But he met each new perplexity with such calmness, courage, and straightforwardness that his Cabinet actually lasted for months after the close of the war. In 1901 a threatened Carlist insurrection led to the downfall of the Conservatives, and Sagasta was again called to power as the one man under whose influence the army would remain loyal to the Alfonsist monarchy. In this task Sagasta's success was brilliant; and he himself had the satisfaction of completing his long and devoted service to the Queen Regent by insuring the peaceful accession to the throne of her young son, the present King. Sagasta remained as Premier during most of the first year of the new reign, everywhere consolidating the power of the actual monarchy. It is believed that the admirable Queen Regent herself could not have preserved the succession to her son during his minority if it had not been for the unswerving loyalty of the great Liberal statesman. Personally Sagasta was rather un-Spanish; he was unarrogant, uneloquent, ungraceful. If his apparently Mephistophelian subtlety was everywhere acknowledged, so also was his personal honesty, no matter how he may have winked at official corruption. He lived simply and died poor—a striking comment upon the integrity which had distinguished a long record of opportunities for private gain irresistibly tempting to men of weaker fiber.

❀

The Irish Land Question The vexed Irish land question has apparently advanced a long step towards solution through the report of the Land Conference which was recently arranged by the Earl of Dunraven and other landlords on the one hand, and, on the other, by Messrs. Russell (Independent), and Redmond, O'Brien, and Harrington (Nationalists), on behalf of the tenants. The Conference received encouragement from Mr. Wyndham, Chief Secretary for Ireland, and, it is understood, from King Edward himself. It would seem as if the Committee represented irreconcilable views; but, according to its just published report, it has made a *unanimous* declaration concerning future governmental aid in Ireland. The unanimity of this recommendation, rather than the terms of the recommendation itself, gives hope, such as has not been cherished before, for future peace and good will in what has often seemed to us an unnecessarily unhappy isle. Indeed, it is safe to say that the unanimous agreement on the land question by representatives of landlords and tenants is the most notable event that has occurred in Ireland for generations. The report even meets the approval of extreme Tory landlords in Ireland—the Duke of Abercorn, the Marquis of Londonderry, Lords Clonbrock and Barrymore, for instance, who at the outset apparently discountenanced the Committee, undoubtedly because they thought that no permanent settlement could be reached, as they considered their estates worth more than the tenants could afford to pay. The rental to be dealt with is no less than $25,000,000. According to the report, the proposed settlement would be on lines of voluntary purchase rather than compulsory sale, and would substitute a reduced installment of purchase-money for rent. In order to accomplish the aims of the Committee, the amount which the Imperial Government would have to pay would be about $3,000,000 a year. The question, there

fore, is: Will the British Treasury officials continue their rather haggling policy as regards Irish matters, or will they institute a broader-gauge system? To insure loyalty the Irish demand generous treatment, if for no other reason than that they are a generous, if hitherto improvident, people. Statistics, however, show that they have been less improvident during the years which have elapsed since the passing of the Gladstone Land Act of 1881. It is believed that public sentiment in the United Kingdom, once convinced that permanency of settlement might be reached by legislation following the encouraging agreement just noted, might force the Treasury's unwilling hand. The unanimous recommendation, therefore, will at least enable the Chief Secretary for Ireland to introduce an Irish land bill into Parliament at its next session. It should be the chief Government measure of that session.

The Dardanelles

Last week the British Government protested to the Turkish Government against the permission recently granted to four unarmed Russian torpedo-boat destroyers to pass through the Dardanelles to the Black Sea under the Russian commercial flag. The British note declares that such a passage of the Dardanelles was a violation of existing international treaties, and adds that if Russia is allowed to send war-ships into the Mediterranean Great Britain will reserve the right to demand that British battle-ships may be sent into the Black Sea. The treaties of 1856 and 1871 provide for the closing of the Dardanelles to war vessels of all countries. The present is not the first violation. Russia has more than once smuggled war-craft through the straits under the guise of harmless merchantmen or transports carrying home time-expired troops. The Russian Government can hardly seriously maintain that a vessel of war entirely changes its character by merely dropping its armament and raising a commercial flag. As, under treaty, England would be allowed to send war-ships to the Black Sea if Russia is permitted to despatch her vessels into the Mediterranean, the protest from the British Government caused considerable irritation in Russian circles, and also some concern on the part of the Turkish authorities, who feared that other Powers might follow the example of Great Britain. The other Power most feared by Turkey would be Germany, and hence there was considerable relief at Constantinople at a non-official announcement later in the week at Berlin that Germany does not propose to associate herself with Great Britain's protest, on the ground that the Berlin Government "considered the Dardanelles equally with the whole of the Mediterranean as outside its sphere of politics." This statement may be only a temporary expedient on the part of William II. He is aware as well as any one that he is not only German Emperor but King of Prussia, which, as a member of the North German Federation, was a signatory of the Treaty of Paris in 1856. While the recent passage of the Dardanelles may not amount to any more than previous evasions of the law, under present conditions it has been an event of sufficient import to compel a decline in English consols, financiers fearing the phantom of possible international complications. The incident, they think, may not be wholly unconnected with Balkan complications, especially with the expected insurrection in Macedonia next spring.

The New German Tariff

By a summary use of closure, the German Government has forced its tariff bill through Parliament, or rather it has forced a tariff measure upon the German people, more drastic and unworkable than was the measure originally proposed. That bill was due to the insistence of the Junkers or Agrarians in Parliament, and the Government's support was popularly supposed to be paid for by a return support from all agriculturists concerning certain governmental undertakings. If the original bill was unwelcome to the entire manufacturing element in Germany, the measure just passed is still more unwelcome. The coalition which has rallied to its support and defeated the Liberals by a vote of two to one has provoked sharp criticisms. Perhaps the most noticeable has come from the venerable Theodor Mommsen, who for many years has commanded world-wide respect, no

account of his History—now a classic—of Rome, but also because he has been regarded as an authority on the history of constitutional development. Professor Mommsen differs from some German scholars in being as fearless in expressing his opinions as he is erudite in forming them. Germans have not forgotten the day when Bismarck caused him and the lamented Georg von Bunsen to be excluded from the Reichstag on account of their courageous strictures upon the Iron Chancellor's autocratic policy. Professor Mommsen calls attention to the peril of continuing any alliance between the Agrarians and the Roman Catholic party of the Center, as under this alliance Germany stands in danger of a renewal of the old feudal régime. The country may again be dominated by the great landowners and nobles acting in harmony with the ecclesiastics. In this event the Constitution itself would be endangered; "its overthrow is rapidly progressing," says Professor Mommsen. In these very modern and progressive times it seems almost impossible that a Junker domination—in other words, an aristocratic absolutism—could long obtain in Germany. Already the new tariff measure has exercised a depressing effect on German commerce and industry. Far from being discouraged by the passage of the bill, the Socialists in Parliament, who were its chief opponents, feel that the measure can endure only for a short time. It would seem improbable that any reactionary agrarian coalition could stand for many years in the path of the progress of manufacturing Germany, importing every year $300,000,000 worth of manufactured products, nearly $500,000,000 worth of foodstuffs, and about $700,000,000 worth of raw material for factory use. A tariff war is not a pleasant thing to contemplate anywhere, but of all protection countries Germany can thus least afford to provoke it.

The New Archbishop of Canterbury

Last week the Rt. Rev. Randall Thomas Davidson, D.D., Bishop of Winchester, was appointed Archbishop of Canterbury to succeed the late Most Rev. Frederick Temple, D.D., who died in December. The new Archbishop is a comparatively young man, but has served a capital apprenticeship for the exalted office to which he has been called; he was born in 1848, and is a son of Henry Davidson, of Edinburgh. He was graduated at Trinity College, Oxford, and for some years served as curate at Dartford, Kent. For the five years following he was chaplain and private secretary to Archbishop Tait, of Canterbury, whose daughter he married. He made the principal arrangements for the great Lambeth Conference of one hundred bishops in 1878, and is consequently well known to the prelates of the Protestant Episcopal Church in this country. He was also chaplain and private secretary to Archbishop Benson. This was followed by his appointment as Examining Chaplain to Bishop Lightfoot, of Durham. During these years he was also one of the six preachers of Canterbury Cathedral; and in 1883 became Dean of Windsor and Domestic Chaplain to the Queen. He was Secretary of the Lambeth Conference of 1888, and afterwards published a history of the Lambeth Conferences. In 1891 he was appointed Bishop of Rochester and Clerk of the Closet in Ordinary to the Queen (in this capacity he ministered to the venerable monarch in her last moments), and in 1895, on Dr. Thorold's death, Bishop of Winchester. During and since his years at Windsor Dr. Davidson has been intimately connected with the Court; he was a close friend of the late Queen, and is one of the recognized advisers of the present King. On the death of Dr. Benson the Archbishopric was offered to Dr. Davidson, but his health at that time was precarious, and he was obliged to decline it. Personally courtly and urbane, the new Archbishop is popular, not only with the Court, but with the people. Unlike Dr. Temple's, his experience has been gained wholly within the Church; like Dr. Temple, he is an ardent temperance reformer as well as a great administrator. His quality of mind is well shown in the admirable biography of Archbishop Tait, his father-in-law, published in 1891. Although Dr. Davidson has been classed as "Broad-Church Evangelical," English Churchmen of whatever party feel sincere satisfaction with his appointment—by far the most important ecclesiastical preferment which Mr. Balfour, the new Premier, has been called upon to recommend.

A Beecher Memorial It is proposed by Plymouth Church of Brooklyn to erect a building which shall stand as a memorial to Henry Ward Beecher. The idea of this memorial originated with Dr. Newell Dwight Hillis, the present pastor of the church, who is working with energy and enthusiasm for its development. Dr. Hillis proposes a Memorial Building that shall be a mausoleum, where objects associated with Mr. Beecher, such as his manuscripts and works of art illustrating his life, shall be kept and displayed. A fund has already been started to provide for this memorial, and a committee of the church has been selected to carry on the work of raising funds and creating public interest. Contributions should be sent to Theodore Miller, President of the Brooklyn Trust Company, Brooklyn, N. Y., who is treasurer of the fund. This suggestion to erect a building which shall stand at once as a mausoleum to contain the body of Henry Ward Beecher, and as a shrine in which all the objects associated with his life shall be preserved, springs out of a natural desire to commemorate one of the most important men in the history of the country; a man whose influence in the support of the idea of nationality and freedom was a large factor in the crisis of the Civil War, and whose eloquent exposition of faith in a God of love was far-reaching in breaking the bondage of the fear of a God of wrath. With the animating purpose of this memorial of Mr. Beecher The Outlook is in profound sympathy, but the matter is too important to let the question of details go by without consideration and perhaps discussion. Memorials ought in all cases to harmonize with the genius and spirit of the man whom they commemorate, and the question as to what is the best form which a memorial to Mr. Beecher could take is one not merely of interest to his church and his personal friends, but to the public at large. It is worth while asking at this stage whether a memorial of Mr. Beecher's great services to the country should not take what might be called a vital form, should not be given the shape of perpetual beneficence to the unfortunate, the struggling, those who have to fight against adverse conditions. Mr. Beecher was pre-eminently an apostle of freedom in religion, in public life, in the individual character. We hope the memorial fund will be raised generously and quickly. But when it is raised, we believe it should be so expended as to express, in the most permanent and concrete form, the spirit which actuated Mr. Beecher in his service to his church, to his country, and to his race.

❀

The Methodist Twentieth-Century Fund With the close of the year 1902 the Twentieth-Century Thank-Offering Movement of the Methodist Episcopal Church came to a termination. In various parts of the country meetings were held on the evening of December 31 commemorative of the movement, and partaking largely of the aspect of a jubilee over the successful accomplishment of the work as outlined by the Board of Bishops of that Church in their first announcement of the Twentieth-Century Movement four years ago. Dr. Edmund M. Mills, the Corresponding Secretary of the Commission having the movement in charge, has made a report covering several of the principal causes for which the funds were contributed. The gifts to universities and colleges amount to $6,932,783; to theological seminaries, $85,730; to institutions for secondary education, $1,132,100; making a total for education of $8,150,613. Dr. Mills reports as the amount subscribed toward debts on church property, $9,003,596; toward philanthropies and charities, $2,519,761; toward a permanent fund for the superannuated ministers of the Church, $604,000; toward churches in destitute communities, $379,000. This makes a grand total of $20,656,970. It should be stated that this vast sum does not represent the whole amount raised under the terms of the movement. Several large gifts in addition to those recorded by Dr. Mills have been made, but are not in his tabulation because not officially reported; but it is quite within bounds to say that the final total will exceed the required amount by a million and a half dollars. Among the educational institutions which received large contributions are Syracuse University, $1,203,800; Ohio Wesleyan University, $1,092,806; American University, $525,000; Cornell College, $405,000; Allegheny College, $310,000; Wes-

leyan University, $287,000; Boston University, $260,000; Hamline University, $250,000; Woman's College of Baltimore, $244,000; University of Southern California, $240,000; University of Denver, $205,000. The fund for the benefit of the superannuated ministers, which, according to Dr. Mills's report, amounts to $604,000, will be greatly increased when all the returns have been collated; indeed, it is quite likely that a special effort will be made to increase this fund to $5,000,000. Although the Methodist Episcopal Church has contributed over $20,000,000 during the last four years on the basis of the Twentieth-Century Thank-Offering Movement, it has also increased its contributions to its various benevolent enterprises and maintained its financial standing in every respect. It was one of the conditions of the Twentieth-Century Movement that the contributions to this fund should be over and above the contributions to all the general causes of the denomination.

❀

A Congregational Encyclical

The National Council of the Congregational Churches of the United States is not a legislative assembly, but simply a voluntary organization composed of representatives from local churches. It holds a triennial meeting, collects and publishes statistics, and performs other services that require united action. The Moderator of the Council has no authority over the churches. He is nevertheless in some respects for the time being the most eminent of Congregationalists, because he is peculiarly "the servant of all." As no other man, he can speak as the representative of the churches of his order. The present Moderator, Dr. Amory H. Bradford, pastor of the First Congregational Church of Montclair, N. J., is especially fitted for his position by his deep-set belief in Congregational principles. He is temperamentally, as well as officially, a representative of Congregationalism. He has just sent out his annual letter to the churches. Coming from one who has double reason for sturdily upholding the independence of the local church, this letter is significant for the stress it lays upon the need of co-operation and unity. Even in matters which are of interest chiefly to Congregationalists, this letter gives emphatic place to recommendations of increased consolidation: specifically, plans of developing fellowship among the churches, of unifying the administration of the missionary societies, and of centralizing, at least in State associations, the system for supplying churches with pastors and the undertaking to pension aged or invalided ministers. In matters of wider import Dr. Bradford's suggestions are of the same import. Looking to the far-off unification of Christendom, he sees it being brought nearer by means of federation. This method of organization he commends because it insures liberty, exalts the essentials in religion, is simple in operation, and it centers attention upon social righteousness. In keeping with this plan for Christian unity is his urgent exhortation to the churches to give heed to the task of bringing about a healthful social order. In doing this he bids them exalt the faith in human brotherhood. "The greatest contribution which the Church can make toward the solution of the social problem is to exhibit a society in which the rich and strong actually do seek to serve the weak and not to please themselves, and in which the poor love those for whom they labor with the very love which was in Christ." He sees "prophecies of spiritual renewal" in the fact that science is bringing nearer "unseen realities," that men are feeling the closeness of human relationships more than ever, and that there is "a growing passion for reality" which, though occasionally leading to temporary defections from the Church, "far more frequently leads to a hitherto unknown appreciation of its spiritual mission." This suggests the type of the coming revival, which will be a more vivid realization of the fatherhood of God on which the brotherhood of men depends. To promote the realization of God, he suggests special meditation and meetings during the coming Lenten season. From the man who more than any one else in America has the right to represent those churches which have insisted, and still insist, upon the independence of the local church and upon the sufficiency of simple forms of worship, these recommendations towards unity and an observance of the church year indicate in a peculiarly striking way the fact that church bodies are becoming less than ever

content with one-sided conceptions of religious life.

❀

The Trust Problem
Natural Laws

There is one objection made to any anti-trust legislation which, if sound, would call for the repeal of all existing statutes on that subject and a cessation of all attempts at legislative control, regulation, or influence. It is expressed by the sentence, "Business should be left to the operation of natural laws." We suppose the proposition is specious or it would not be used. But it is to us a matter for surprise that it deceives any one.

No doubt there is always a danger of unwise interference with natural laws; of such an attempt to regulate as will be injurious, not beneficial, to the community; of a control that may become despotic and so both unjust and disastrous. No doubt great wisdom and great care should be exercised in regulating trade and commerce; no doubt individual liberty should be maintained as far as it can be made consistent with the public welfare; no doubt the more we can make the private conscience, enforced by public opinion, efficacious, and the less we have to resort to governmental authority, the better. All this may be and is true. But the notion that remedy for industrial ills can be found by a do-nothing policy, in the faith that natural law will bring about universal justice and will promote the common welfare, appears to us to ignore the self-evident facts of modern industrial life.

A man on a higher level builds a dam across the stream which irrigates his neighbor's grounds, and diverts the water to his own uses. His neighbor complains of the water famine which destroys the fertility of his land. The dam-builder replies, "Law must not interfere. You must leave natural law to take its course." The reply is not far to seek. The dam-builder does not leave natural law to take its course. By building the dam he has himself interfered with the course of natural law. What he really means, whether he is conscious of it or not, is this: "I must have a right to interfere with natural law, and you, my neighbor, must not. You must not interfere with my interference." And this is exactly what is meant by the plea that natural law must be left to take its course without legislative interference, when that plea is put forth by the advocates of trusts, monopolies, and combines.

When natural law ruled in this continent, the North American Indians blazed pathways through the forests, and when any one of them wished to travel, he put his goods upon his back, or upon his wife's back, and took what path he pleased, when he pleased, and traveled at what rate he pleased. When civilization took possession of the continent, one of the things it did was to create by law an artificial person called a railroad corporation; to this artificial person it gave the right to take the real estate of A and B and C, through the whole alphabet many times repeated, whether A and B and C wished to sell or not, and to pay them, not what price they asked, but whatever price a disinterested tribunal put upon the land. And so, by a most direct and positive interference with natural law, a public highway was constructed by which individuals and goods could be more conveniently carried than in packs upon the back of the traveler along a blazed pathway through the forest. Society created this artificial person, and conferred upon this person this artificial power, because it rightly believed that thus the public interests would be promoted and the public welfare advanced. Now that it finds this power unjustly used, not for the equal service of all, but for enriching one and impoverishing another, and it proposes to require this artificial person to use this artificial power for the benefit of the public and not for its injury, what sense is there in crying out against the requirement on the ground that government should leave transportation to the operation of natural law. It is not left to the operation of natural law. It is carried on by artificial organizations created by law and equipped with artificial power by law. And it is eminently right that society, which has created and empowered the corporations to serve the community, should require them to render the service for which they were created. Otherwise the corporation becomes the iron despot of the Frankenstein who has created it.

There are stored up in the hills of Pennsylvania great masses of coal. Under the operation of natural law any man might go to these hills, put in his pick, and dig out what coal he needed for his fuel, as the North American Indian cut down in the forest whatever wood he needed for his fuel. But civilization cannot go on under the operation of natural law. So, by a complicated artificial system, we have given the ownership of these lands to individuals; we have given the ownership of the top of the soil to one set of individuals, and ownership of the underground mines to another set of individuals. Their right to the soil depends wholly upon the artificial arrangements which society has made. Society determines what they may own, how far down they may own, for how long a time they may own, under what conditions they may own. In England the owner may control the land for an indefinite period after his death. In America he can control it for only two lives. In France he must divide it in a certain fixed proportion among his children. This individual proprietary right in land is wholly an artificial right, created by statute, controlled and regulated by statute. And it has been so created and regulated because society thinks this is the best method for the promotion of the general interests of society. And now, when the owners of these coal lands combine and charge extortionate prices for the fuel which they did not create, and their right to control which is wholly an artificial right created by society, to aver that society's power to regulate and control has been exhausted, and that it cannot go on and compel the owners whose right in the coal it has created to use these rights in subordination to the public right to fuel, is to affirm that society may create rights which it is powerless to regulate after it has created them, that it may interfere with natural laws just far enough to give to a dozen operators a monopoly in a fuel necessary to human well-being, if not to human life, but may not interfere when interference becomes necessary to prevent individual greed from inflicting untold disaster on the general public. As we are writing this article the daily press is reporting the Congressional investigation into the cause of the extortionate prices charged for coal, which have produced untold suffering and in one or two cases, as reported, death. From one account of this investigation we quote the following sentence:

> There was considerable feeling manifested between the dealers who were members of the local association and those who were not. One who would not join the association declared emphatically that the Reading company was holding up its supply of coal, and furnishing transportation facilities to the independent operators for the purpose of allowing them to charge exorbitant prices for their product, and then divide the swag with the Reading.

We do not affirm that this is true; but we do affirm that the people have a right to ascertain whether it is true or not; and, if it is true, they have a right promptly to put an end to such a despotic use by a corporation of powers which have been conferred upon it by the people.

Civilization is not the product of natural laws operating without human intervention. It is the product of natural laws employed by man for man's benefit. Natural law does not make a locomotive or a dynamo. Man, understanding natural law, and using it for his purposes, makes the locomotive and the dynamo, and by means of them causes steam and electricity to do what he wishes them to do. He possesses power to use natural forces to accomplish predetermined ends. He possesses the same power to use intellectual and moral forces to predetermined ends. By this capacity he has built the locomotive, the dynamo, the stationary engine. By this capacity he has built up the State, the Church, the school, the various industrial organizations. This capacity distinguishes him from the beasts. To forego this capacity and leave natural law to work out its results unmodified by human volition would be to go back to barbarism, nay, to the pre-human conditions of the field and the forest. To stop in the use of this intelligence when it has gone far enough to serve the few who are well and strong, and not far enough to serve the many, would be simply to perpetuate in a new form that aristocracy against which democracy in government, education, and religion is a revolt. In attempting to make natural law serve, not the favored few, but all the people, democracy will make mistakes; it will attempt unsuccessful experiments; it will meet with failures;

and it will be obstructed by some who think that nothing can be but what has been, and by others who, having the larger share of the world's wealth and power, object to any further distribution of either. But we greatly mistake the temper of the American people if this movement so to use natural laws, so to administer natural forces—both physical and moral—as to serve the welfare of the entire people, can be permanently either halted or diverted by the unspecious plea that natural law is not to be directed to wise and profitable ends by human intelligence and human wills.

❀

Southern Education

The meeting held in Carnegie Hall, in this city, on Friday evening of last week, in behalf of the General and the Southern Education Boards, was attended by a very influential and deeply interested audience; for the work of these two Boards is being rapidly recognized in all parts of the country as being not only educational in the technical sense, but as having the most fruitful relations to the public life of the United States. Dr. Adler used a very happy phrase when he described the work of the two Boards as "unofficial statesmanship." Speeches were made by President Dabney, of the University of Tennessee, who made a careful and extremely lucid statement of the school situation in the South; by President Alderman, of Tulane University; by Dr. C. D. McIver, President of the North Carolina State Normal and Industrial School; by Mr. William H. Baldwin, Jr., and by Mr. Morris K. Jesup. The three Southern men among the speakers are among the foremost educational leaders of the South; and it is not invidious to rank them among the foremost statesmen of the South to-day. The phrase "educational statesmen," which has been applied to Governor Aycock, of North Carolina, and to Governor Montague, of Virginia, indicates the place which the educational question has come to have in many parts of the South, and is suggestive of that broader conception of public life to which events in this country are fast educating men of all sections. So important in its fundamental bearings upon the public life of the country is the educational movement in the South that Mr. Michael Sadler, an Englishman who speaks with authority on educational matters, was justified in saying, a few months ago, "It is a work which is not merely national, but international, in character."

The General Education Board, which has its central office in this city, is devoting itself to the rural schools of the South, acting as an agency for the beneficence of private individuals, selecting schools which need aid, co-operating with local generosity, and making a thorough survey of the rural school system throughout all parts of the South. The Southern Board, on the other hand, is carrying on a vigorous educational propaganda, striving everywhere to create throughout the South a general interest in education, and to persuade people to acquiesce in a heavier taxation to build up educational systems. The campaign has been thoroughly planned, for both Boards are under the management of men who are not only enthusiastic in their devotion to the cause they have at heart, but eminently practical, and who know at first hand the field in which they are working. Under the direction of the General Board three State conferences have already been held in North Carolina, Louisiana, and Georgia; similar conferences have been arranged for in Florida, Alabama, and Virginia. In these conferences the most progressive men in the different States are brought together, the work and purpose of the Board explained, and the problems connected with educational work, such as taxation, consolidation of school districts, the beautifying of school-houses, negro education, and all matters relating to rural schools, presented by men who have thorough command of the subject. A model school for negroes has been established near Athens, and summer schools for negro teachers at Hampton and Tuskegee. The Board has co-operated with three summer schools for white teachers, and has given aid in different amounts to normal schools in various parts of the South. Never, perhaps, in the history of the country has so large a movement been so thoroughly organized, so well directed, and accomplished so much in so brief a period. A vast amount of information relating to educational conditions in

parts of the South has been collected; and the Board is in a position to do its work with increasing intelligence and efficiency.

The work is a National one, although its field is in the Southern States. The generosity and sacrifice of the South for education, taking into account the limited resources of the Southern people during the last twenty years, are just beginning to be understood at the North, and wherever understood are evoking a response which is a practical recognition of what is due to a people who have put forth heroic efforts to rebuild their social structure, and who are struggling with problems of appalling magnitude. Those who know the history of the South since the war are filled with admiration for the quiet courage, the undaunted energy, and the heroic patience with which that section has been working out its industrial and social reorganization. In no other movement has the enthusiasm, what may be called the gallantry, of the Southern character been more strikingly indicated than in the educational movement. A story of that movement is already a record of individual self-denial and heroic self-sacrifice; if it could be told in terms of personal experience, it would awaken the admiration of the whole Nation. Among the men who are leading the South to-day in this new era of its development, there are none better deserving the confidence and admiration of the Nation than men like President Alderman, President Dabney, and Dr. McIver. The million dollars given by Mr. Rockefeller for the work of the General Education Board makes it possible for that Board to spend a hundred thousand dollars each year for the next decade; but, as Mr. Baldwin declared at the meeting, this "is but a drop in the bucket. The trustees of this fund believe that every dollar expended in education in the South is a good investment, and they are going to ask the people of this whole country to make such an investment. We have provided a business organization composed of men every one of whose names is a household word—men whom you can trust—who are to manage this money in the best possible way, and it is to this board that we are going to ask the public to intrust funds for this great purpose."

A Significant Novel

Those who keep in touch with the life not of a section, but of the country as a whole, and are sensitive to the stirrings of the spirit over the length and breadth of the continent, have felt for several years past that we are approaching another and more comprehensive expression of American life in books. One of the results of the journalistic treatment of literature, now so prevalent, is the attempt to take account of stock every week and to measure accurately the rise and fall of the tide of creative power from year to year. In the nature of things this is impossible; but the fact that it is impossible does not deter a great many people from pronouncing final judgments on literary conditions and prospects. When the tide recedes, these critics are sure that the artistic impulse in America has spent itself, or that the country has ceased to produce the material of which art is made. They are confident that commercialism, or the practical spirit, or the decay of the love of the beautiful, or absorption in material activities, has drained the springs of inspiration, and that nothing can be hoped from America in the future except a civilization which is content to work with its hands and leave other civilizations to work with the soul.

Nothing could be more short-sighted or lacking in the historical spirit than these predictions. Again and again in literary history the rise and the fall of the tide of creative power have left their marks; again and again, when the vital force which blossoms in every art has receded and left the earth bare and bleak, it has come back with a rush and sweep unknown before, while the elegists were chanting its funeral dirges. No one can feel deeply the tremendous forces which are at work in the life of this country to-day without being confident that, sooner or later, those forces will find their expression in literature. Such a tide of energy as that which has been steadily mounting since the Civil War cannot find utterance for itself in material activities. Sooner or later, it reaches the higher levels of the soul, and intensity of action is translated by men of genius into intensity of aspiration.

At the very time when the pres

finds it difficult to keep the record of the material growth of the country, so rapid and so vast is it, there has come and gone a man with the original insight, the profound sympathy, the touch with his kind, which are the prime elements of power in a great man of letters. It is easy to overestimate the significance of a writer, like Frank Norris, who dies at the very beginning of his career; and it is too soon to pass final judgment upon the work which he has left; but it must be quite clear, even to those who differ widely from the young novelist in his methods and his point of view, that the author of "The Octopus" and "The Pit" brought to the study of American life that power of looking beneath the surface, of touching the great realities, of seeing the dramatic and ethical aspects of contemporary movements, which constitute original force in literature. While other men were saying that there can be no poetry or romance in a country so engrossed in business affairs, so absorbed in gigantic practical enterprises, Frank Norris fastened upon one of the most engrossing, colossal, and in a sense tyrannical of these activities, saw how every great outgoing of energy relates itself to many forms of life, and how impossible it is for men to work lavishly and with sublime forgetfulness with their hands without engaging their souls; and, equipped with this insight, guided by this sympathy, Norris was artist enough to seize the dramatic aspects of the raising of wheat, its transportation, and its final distribution. It was an immense theme, demanding the energy of a Zola and the genius of a Tolstoi.

It is not surprising that a man who died at thirty-two should not have shown a complete mastery of his material, and should have failed perfectly to coördinate all the parts of his great design. What is significant is the fact that he saw under the surface of American life the deep and inexhaustible human interest; and that he had the genius to recognize the epical quality, not of life in Russia or in France, but on the wheat-fields of the Far West and in the exchange in Chicago.

That he had the faults of a young writer is clear enough. "McTeague" was the book of a very young man, who could not discriminate clearly between what was essential and what was non-essential, and, in his attempt to tell the truth as he saw it, was willing to drag in incidents which were not only disagreeable but absurdly out of place in any formal study of character. The book was significant, not as a finished piece of art, nor as a faultless piece of workmanship, but as disclosing a determination to see things as they are, and to deal with them, not only from first-hand knowledge, but with first-hand directness and power. When "The Octopus" appeared, it registered an immense advance on all its predecessors. It was far from being a finished piece of work. The influence of Zola was evident on almost every chapter; it lacked concentration; there were departures from good taste in it, and there was lack of restraint; but, on the other hand, there were the tread and swing of a powerful man, exploring, with open mind and heart, a great new field.

The second story in the trilogy which Norris planned shows a still greater advance on the work which preceded it. There are signs of immaturity in "The Pit." The lighter phases of life with which it deals are not always touched with a light hand; Norris had still much to learn in the delicate art of social portraiture. But in the handling of his main theme "The Pit" shows the touch of a master. There is a current in the story which is almost irresistible, and which mounts at times to the height of a flood. Such power is not common anywhere in the literature of the world, and it has very rarely appeared in this country. No such searching study of the absorbing, tyrannical, destructive fascination of speculation has ever before appeared. In its vivid description of relentless energy, made up of a thousand details, each one of which contributes to the impressiveness of the general effect, one is no longer reminded of Zola, from whose influence Norris had evidently broken away, but of Balzac. There is no imitation of the method of the older writer on the part of the younger writer; but there is the same thoroughgoing, searching study of all the phenomena contributing to a tremendous impressiveness in the total result.

"The Pit," which bears the
Messrs. Doubleday, Page &

widely read for its human interest; it ought to be widely read for its searching exposure of one of the perils which menace American growth and manhood in the country. It would be premature to hail "The Pit" as the great American novel. It has evident faults; but its insight, its power of imagination, and its tremendous energy ought to silence those who have been ready to declare that the material of great art does not exist on this continent; and it will confirm the hopes of those who believe that there is to be another literary development in America in the near future not less characteristic of the hope of the New World than was the fine, aspiring, noble-minded literature of a past generation.

The Impressions of a Careless Traveler

V.

April 5.

IT is idle to attempt to recall and record the suppressed excitement which we all shared when we found ourselves yesterday in the Ægean Sea, and to describe the various scenes in the ever-changing panorama as we sailed among the islands of the Grecian Archipelago. At one point we saw a ruined temple to Athene on one bold promontory overlooking the sea, and watched it for an hour; then it was that I first realized that I was really in Grecian waters. Once we saw a village, partly modern, partly remains apparently of an older time; what it was I could not make out; some of our fellow-passengers were wiser and knew or thought they knew; but I did not take their information very seriously, and have already forgotten what it was. For some time Mount Olympus, snow-capped, was clearly discernible in the distance; that it was Mount Olympus we were certain, both from the direction in which it lay and from the fact that there is no other snow-capped mountain in the vicinity. I almost repented my resolve to bring no temptations to study with me. I wished that I had a history of Greece, or Mahaffy's "Survey of Greek Civilization," or at least Bulfinch's "Age of Fable"—anything to enable me to revive the little knowledge I once possessed of this land of romance and of tragedy. I envied the two or three collegians on board whose knowledge was more recent, and who could therefore reclothe these shores with some resemblance to the ancient life. I think, too, I would have been willing to take for twenty-four hours the responsibility of command, just to direct the steamer to land us at the Plains of Troy, and lie off shore there for the day, that we might get at least a tantalizing glimpse of the excavation at Mycenæ. I went to bed early and asked the steward to call me as we approached the Dardanelles, and was on deck at half-past five this morning as we entered them. We stopped opposite the formidable batteries which the Turkish Government has erected to command this entrance, while some Turkish official rowed out in a boat to examine our papers and give us permission to enter. The batteries were formidable; but not so the three Turkish men-of-war in the harbor. I do not know much about shipping; but if their boilers and engines were in no better condition than their hulls, which were covered with barnacles to an extent I never saw before even on a stranded hulk, combined they would be no match for one American gunboat. The Turkish officer, in his uniform and his red fez, looked like a gentleman; but a more villainous set of countenances I never saw than those of three or four boatmen who attended him. The Armenian massacres are no longer an enigma to me. All day has been spent in the sail up the Dardanelles, past the narrow strait across which Byron swam in emulation of the Greek Leander, and through the inland Sea of Marmora. Not until well on in the afternoon did we come in sight of Constantinople and watch the domes and minarets of the city emerge from the haze, while we looked on wondering and questioning of one another which was the Mosque of St. Sophia, and where was the palace in which the brother of the Sultan was supposed to

be confined for life for no other crime than that of being the Sultan's brother, and which was Scutari and which Stamboul, and where was the Golden Horn and where the famous bridge of boats.

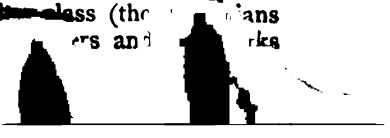
Hardly had we come to anchor near the mouth of the Golden Horn before a tugboat appeared maneuvering about us, but whether to get at us or out of our path it was at first difficult to guess. The Matron was the first to spy some familiar faces on the boat. Yes, there were our friends. Now they are on board our steamer with their greetings, and which is the happier, they or we, who can tell? Now we are all of us on the tug with our hand luggage. Now we are at the custom-house. Now we are walking along the famous bridge of boats, across the Golden Horn, our baggage examined and our passports viséed.

April 8.

We are back on the Prinzessin again, and though I should have liked more time to study Constantinople and more time to spend with my friends, and time to accept an invitation which I received to go a day's journey into the country and see a rural Turkish community and what Christian missionaries are doing in the interior, I am not unthankful, to be out of what is the worst-governed city I ever saw in my life—worse in all of its aspects than anything I ever dreamed of. I shall not attempt to preserve here the pictorial and dramatic aspects of our experiences, though I hope never wholly to forget them: the beauty of the Bosphorus; the splendid site of Robert College, which occupies the best situation between the Golden Horn and the Black Sea; the queer steamers which ply up and down, with a harem for the women which no man may enter if there is a Turkish woman in it, but may if there are only Frank women; the ostentatious but flimsy-looking palaces along the shore; the mosques, especially the splendid mosque of St. Sophia, with its aerial dome resting on nothing, like the dome of the heavens; the cosmopolitan markets; the shops, big and little; the famous bridge of boats, with the constant procession passing and repassing upon it; the overloaded porters, bent nearly double under their burdens; the veiled women looking at you with great eyes through the openings in their veils; the disreputable graveyards, unkempt and uncared for, which constitute apparently the sole pleasure-grounds of Constantinople; the evening call to prayer as we heard it in the gloaming, repeated from minaret to minaret along the banks of the Bosphorus—these hints, aided by such snap-shots as I was able to get with my camera, must serve to keep alive the outward aspects of life in Constantinople. For more detailed impressions I can always go to the pages of Charles Dudley Warner and D'Amicis. But I have my own impressions of the civic and political life. Our visit was very brief, it was true—too brief for any adequate study of conditions. But some of the conditions were too apparent to require study, and I had the advantage of information from permanent residents in the city.

Midway between the Black Sea on the north and the Ægean Sea leading into the Mediterranean on the south is the little Sea of Marmora, at a guess twenty-five or thirty miles in length, for we were two hours or a little over traversing it. The Hellespont connects it with the Ægean Sea, the Bosphorus with the Black Sea—two narrow straits the bold rocky shores of which are easily fortified. The Sea of Marmora is thus a landlocked and easily protected harbor, within which the fleets of the world could not only ride at anchor but could conduct naval maneuvers. Judging from the absence of lighthouses and buoys, the water is everywhere relatively safe. Where the Bosphorus enters the Sea of Marmora, and at right angles to it, there enters from the west a broad but comparatively short river, which at the point of juncture is rather an arm of the sea. This is the Golden Horn. Where these two streams enter the Sea of Marmora three cities of considerable size are clustered: on the eastern or Asiatic shore, Scutari; on the western or European shore, south of the Golden Horn, Stamboul, north of the Golden Horn, Galata and Pera, which are as indistinguishable from each other as Williamsburg and Brooklyn, the name of Galata being given to the portion lying along the water's edge, the name of Pera to the portion rising above it on the side of one of the steep hills which, leaving but a narrow

margin, wall in the Bosphorus on both shores. Galata and Pera are the modern city; contain the good hotels, the banking houses, the commercial offices, etc.; are supposedly relatively decent but uninteresting. We did not visit this section. Scutari is the oldest and the most squalid portion, as we saw it in our brief and incidental visit on Sunday. Stamboul is the ancient city; the city of the Turks and the city for sightseers. Here are the great mosques, the famous bazaars, the museum, the extraordinarily Oriental and cosmopolitan market; here the strange costumes and the strange faces. These four cities, Stamboul, Galata, Pera, and Scutari, constitute the city of Constantinople. A city so situated ought to be one of the chief commercial and manufacturing centers of Europe. Its harbor ought to be full of the fleets of commerce; it should collect the products of European manufactures needed in the East and Eastern products demanded in Europe; it should be a manufacturing center of raw material brought from both communities; it should at least be the connecting link between Eastern Europe and Western Asia, and a distributing reservoir for both; it should have great piers, commodious warehouses, large and active manufacturing establishments, broad avenues, well-paved and well-lighted streets, a busy and large population. It has none of them, and the reason it has none of them is because it has nothing worthy to be called a government.



One day not long since a lady in the environs of Constantinople was sitting in the library of her house when she heard the report of a gun, and then shot fell in the hall and in the room at her feet. Half a dozen panes of glass had been broken by the shot. She rushed out to find a Turkish neighbor—a shepherd—of an unenviable reputation near by, shotgun in hand. She called him to account, and he replied that he was shooting at a dog which had been killing his sheep. But dogs have not wings, she said, and to have shot thus into my windows you must have shot up into the air. She got no satisfactory reply, proposed to report the case to the police, but was dissuaded by her friends. The police will do nothing, they said; the police are afraid of him. And if you make him any more your enemy than he is now, you will find some memb of your family murdered some night his way up from the boat, and no one w know by whom, and no one will troub to inquire. This little incident is fair illustrative of the Turkish Government, c to speak more accurately, of the Turki no-government. No one is really safe- no one, from the Sultan to the lowe peasant. The Sultan lives in daily drea for his life, and rarely stirs outside h palace grounds. He is universally hate by Turk as well as by Christian. Fro rapacity and greed in a favorite of th Sultan no person is really safe. Th widow of a once prominent Pasha owne house and land in the vicinity of Constar tinople which had been a long time in th family. An unscrupulous favorite of th Sultan, a scheming and influential poli tician, laid covetous eyes on it, and offere her an absurdly small price for it—per haps half its market value. Her friend advised her to sell, and she did so, rathe than risk the peril to herself and he children of arousing his enmity by refusal. Robert College wished to adc seven acres to its grounds. The bargair was made, the price agreed upon, every thing was settled but the delivery of the deed and the money for the deed. Bu a year elapsed before the transfer could be finally effected, and the matter had to be kept a profound secret lest political influences should be brought to bear to prevent the sale. The owner planted trees in the lot to conceal his purpose to sell, and on the day when the exchange was made would not come up to the College for the transfer lest the secret should be suspected, but sent for its President to meet him elsewhere.

Such is the Turkish Government on its executive side. On its administrative side it is quite as bad. Constantinople is probably the worst-administered city in the world. Its dirt and its dogs defy description. The latter divide the task of scavenger with beggars; both prowl the streets at night, and our fellow-passengers affirm that the yelping of the dogs, even in Pera, the modern city, made sleep at night well-nigh impossible. The roads in the immediate suburbs of Constantinople are, many of them, impassable for carriages. I did not learn as to the sewer system, though I think there is practically none, and

apparently nothing that could be called a water system. There is no local post-office. If one wishes to send a letter from one part of Constantinople to another part, he must send it by a porter. Corruption pervades all branches of administration; indeed, all departments of the Empire. The Government is bankrupt; the Empire is reported to be some years in arrears to its soldiers, though, as there is no popular assembly, no responsibility to the people, no free press, and, so far as I can learn, no public reports, it is difficult to get at the facts with any approximation to accuracy. But the Sultan personally is enormously rich. When an English Duke, a few weeks ago, visiting Constantinople in his yacht, called on the Sultan, and the Sultan wished to return the visit and did not wish to risk his person in so public a manner as would be required by a visit to the yacht, he put a palace on shore, royally fitted up and with a retinue of servants, at the Duke's disposal, that the visit might be made there. To put the whole situation in a sentence, "Constantinople is thoroughly Crokerized." It is carried on by the Sultan and his favorites on the principle avowed by Mr. Croker, "I am in politics for what I can make out of it."

Appeal to the courts appears, from all that I can learn, to be quite useless. Justice is sold by the court to the highest bidder; payment of the suitors to the judge is regarded as quite legitimate; and he only is looked upon as an unjust judge who receives money from a suitor and then renders decision against him. Even when justice is not corrupt, it is not, I judge, very intelligent, from this Turkish popular story illustrative of Turkish justice. Once upon a time—so the story runs—a thief climbing over the fence of his neighbor to break into his house fell, caught his eye on a hook to which the clothes-line was attached, and destroyed his eye. He brought complaint against the owner of the house which he was planning to rob. The judge decided that the owner must lose his eye, because the law says, An eye for an eye. In vain the innocent house-owner pleaded his right to have a hook in his yard for his clothes-line and the no-right of the intruding burglar to be there at all. The law was explicit: an eye for an eye. At last a happy thought struck the defendant. "I am a tailor," he said to the judge, "and I need both my eyes. If one of them is put out, I can no longer support my family and they will become objects of charity. But my neighbor is a hunter. When he goes shooting, he closes one eye to take aim. Take his eye out. It will be an accommodation to him; I shall still be able to support my family, and the law will be maintained." "Excellent suggestion!" cried the judge; and it was so decreed. Such a story is not to be taken too seriously; but the fact that it is found in the folk-lore of the Turkish people indicates at least what is the popular conception of justice as practically obtainable in Turkey.

I naturally made some inquiries of residents as to the Armenian massacres. The result fully confirmed my previous impressions. Turkey had solemnly promised the Powers certain political reforms. Turkey never fulfills her promises unless she is compelled to do so, and the Powers were too jealous of one another to unite in bringing any pressure to bear on Turkey to initiate the reforms. The Christians in the Empire universally desired them; so did a small but growing party of Turks known as Young or Reforming Turks. There were a few fanatical Armenians—neither considerable in numbers nor in influence with their own countrymen—who were too impatient to await the development of events and who constituted a Revolutionary Committee. This fact furnished at once a provocation and an excuse to the Turkish Government. The universal belief among the foreigners in Turkey appears to be that the orders for the massacres came from the Porte. It is certain that the first massacres, those at Trebizond, were commenced without the knowledge of the local Governor, who used all the power he possessed, at no inconsiderable hazard to himself, to stop the massacre in his own city; of course he was powerless to arrest it elsewhere. The fire, once lighted, easily and rapidly spread. The massacres which followed were due partly to race and religious prejudices, partly to Turkish envy of the most prosperous people in the Empire, partly to the hostility of a debtor to a creditor class (the Armenians being the money-lenders and

the money-borrowers in most Turkish communities), partly to a desire for plunder by the unprincipled, partly to the inability of a feeble Government to put any check on fanatical violence when once it had commenced its remorseless work, partly to deliberate incitements by the Government, which was only too willing to have its subjects butchered if so the reforming party in Turkey, and especially the Young or Reforming Turks, could be curbed into silence and submission. The impression which some of us in America had entertained, that the English Government could have stopped the massacres if it had acted promptly and courageously, was confirmed by a report, certainly believed in high quarters and apparently well founded. It is to the effect that the English Minister in Constantinople, after the Trebizond massacre, had given orders to the British fleet to pass the Dardanelles and come up to Constantinople, that the forts were not in condition to resist, and there were Turks ready in Constantinople to co-operate and put the Sultan on board the British fleet and put another and better man in his place. But Lord Salisbury, with characteristic caution, was afraid to act, and ordered delay; the forts were put in readiness; and later, when the continuing massacres had aroused the English public, it was too late to force the Dardanelles. England has paid for this pusillanimity. The Turk understands a threat, but understands nothing else. English influence, which was formerly dominant at Constantinople, is so no longer. It is now the Germans who control both politically and commercially in the Turkish Empire. I was told also, and on what seemed to me good authority, that while every European Power was jealous of every other European Power, and no one of them was willing that Constantinople should come under the dominating influence of any of the others, least of all that it should become a Russian port, they would all be glad if the United States would take it under her wing and make it a free city under an American protectorate, and that even some hopes were expressed that this would be the result of our claims for damages against Turkey. Possibly rumors of this desire reached the ears of the Sublime Porte and led it to pay those claims. This might be a satisfacto solution of the Eastern question to Eu pean Powers, it would not be serious entertained, I imagine, by Americans, least at present; but that it is even se ously discussed at European dinner-tabl may serve to illustrate the complexity the Turkish problem. As to its solutio I have to confess to myself that my bri visit has given me no light; it has on enabled me to see more clearly than have ever done before the intolerabl condition of the present situation, an the apparent hopelessness of any of th proposed remedies. I suspect the remed will come in a totally unexpected manne and by some form of revolution. An yet it is difficult to see how revolutio could have any prospect of success. Th various elements which make up th Turkish community—Turks, Greeks, Ar menians, Bulgarians, etc.—are jealous o one another, and as yet their commor detestation of a detestable government has not sufficed to unite them in making a common cause for reform of any sort. The Turkish army is an effective fighting machine, and though it is not very intelligent, it is, to a considerable extent, officered by Germans, who are perhaps the most intelligent in the art of war of any Europeans. There are practically no arms in the private possession of any of the people in Turkey, and the Government does not mean that there shall be. How much on its guard it is against the importation of arms is illustrated by a single incident. A benevolent friend sent a tennis set from America to the American College for Girls. It was stopped at the custom-house, and only with considerable difficulty were the custom-house authorities persuaded that tennis-balls sent to a college of girls were not intended as ammunition for a revolutionary uprising. There is, however, a public-school system, recently organized and somewhat efficient in the towns. The existence of mission schools has created a demand for education which could not be wholly resisted. Perhaps through these schools the Young or Reforming Turkish party may in time be increased so as to become a political power. I wish so; I can almost say I hope so. In no other direction do I see present ground for hope for unhappy Turkey. L. A.

A FIGHT FOR THE CITY

THE STORY OF A CAMPAIGN OF AMATEURS

BY ALFRED HODDER

Private Secretary to District Attorney Jerome

Introductory

THE story of Mr. Jerome's campaign in New York City in 1901 as it is here set down is a story by an eye-witness, but by an eye-witness who had in the beginning no intention whatsoever of playing the chronicler. It was in great part a campaign of amateurs, and an improvised campaign. Mr. Jerome was himself in some sort an amateur in politics; he had, indeed, been an active member of the City Club from the date of its formation; he had been Chairman of the Committee of Seventy and member of the Executive Committee in the campaign that resulted in the election of Mayor Strong; he had been associate counsel in the investigation made by the Lexow Committee; but, apart from these sporadic incursions into politics, he had confined himself to executing with singular audacity and energy the duties of judge in the Court of Special Sessions. With one exception, those of his adherents who first rallied together had never taken part in the organization of a canvass. None of them had long been friends of his, and few of them had long been friends of one another. As a group they came into existence unexpectedly, fortuitously, to meet the needs of the occasion. The bond uniting them was new and incidental as the bond uniting a group of Western ranchmen. They were not Westerners, they were city-bred, they were college-bred, they were even supercivilized, yet to a man bred in the West they conjured up an image of the plains. Their talk was picturesque and varied as the talk of cowboys, which is saying much for it; they were as ready with a jest, as slothful seemingly, as swift in the despatch of business; there was as little formalism among them, as little cant, as little pose. There was not even much heat of indignation; in Mr. Jerome, indeed, there burned beneath a cavalier exterior the wrath of a Hebrew prophet; but his allies were not hot, they were determined simply; they took cognizance of grievances and outrages only as matters of which they purposed trying to make an end. And precisely as in the West it has been found that wherever a few men of our race are gathered together there exists, potentially at least, for all the purposes of justice, of law and necessary order, the Anglo-Saxon State, so it was found that in this random group there was the making of an effective political machine. There from time immemorial has lain the safeguard of the race against all species of oppression; and there to-day lies its safeguard against the tyranny of any machine.

Mr. Jerome's appearance in the field of politics was to me of even more immediate interest than to the general public, for reasons of my own. I knew him, like the general public, only through the medium of the daily press; but I had for years been wondering, not unhopefully, what would be the effect in an American election of a candidate who from the platform told the truth, the whole truth, and nothing but the truth, as steadily as from the witness-stand; and in the preceding months I had been engaged, in company with Josiah Flynt, in an investigation of the Powers that Prey and the alliance between them and the Powers that Rule. Here was a man in office knowing more than I could know of the alliance between the Powers that Rule and the Powers that Prey, and determined to dissolve it; here, as a few

nights' speeches showed, was a candidate who told the truth. It happened also that I had written in my academic days a book directed against both skepticism and so-called idealism in philosophy, in the interest of the realism of the man of science and of the plain man; a book which was essentially a plea for loyalty, even in metaphysics and even for reasons strictly metaphysical, to truth and fact. The principles of that book I was intending to illustrate further with reference to literary criticism and with reference to politics in the United States. The volume on politics had been planned already; it was to have begun with a defense, although a qualified defense, of Tammany; it was to have continued with an attack upon so-called reformers, and to have concluded with the exposition of a system of reform quite different from theirs—a system of loyalty to truth and fact. A living man is of more interest than any system, and an experiment than any theory. I found myself recording a campaign instead of elaborating the book I had projected, or even plying my more immediate trade of novelist. Mr. Jerome's course of action proved so excellent an illustration of much that I had to say concerning politics that the illustration has for the time being taken precedence of the text.

Imperfect as the record is, the interest of the campaign recorded seems to me to be neither merely local nor ephemeral. For the present, at least, New York is obviously the chief city of America; its daily news is in some sort, like that of Washington, the daily news of every city in the United States. The municipal conditions that have long prevailed there are in essentials the conditions that prevail in almost every large city of the United States—in almost every city numbering more than fifty thousand inhabitants. The sources of danger and of safety are the same; the outlook is, on the whole, the same.

It is true, as Mr. Jerome said in his closing speeches, that democracy is on its trial; so much is patent even to those who have no great fear for the result. The name and even the watchwords of democracy are in America, indeed, assured of their supremacy. But in the course of application to the complex world of fact, all simple formulas are destined to undergo strange transmutations. As the simple formulas of Christianity have served as manifesto for a bewildering variety of systems of ethics and church government, in some at least of which it may be plausibly asserted that the essence of Christianity has disappeared, so the simple formulas of democracy may serve as manifesto for a bewildering variety of forms of civil government. What the form will be that bears in the United States the title of democracy may well be matter of doubt and even of anxiety; the United States is not the smallest or the simplest fact in the vast, complex world. And nowhere, perhaps, so well as in the city of New York can be seen the interaction of the forces that are molding the government of the Republic from within.

I.—The Hunting of John Doe

When, at the close of the municipal campaign of 1901, Mr. Shepard formulated the two main causes that had led to the victory of the Fusion ticket, he found them in the offense given to the public by the words and acts of William Devery, first Chief and then Deputy Commissioner of Police under the late administration, and in the part played in the last weeks of the canvass by the Fusion candidate for District Attorney of the County of New York, William Travers Jerome. Mr. Jerome had been for five years a Justice of the Court of Special Sessions, and in the spring and summer preceding the canvass had been the center of attention as a principal in a prolonged duel with Devery.

Devery had at once given offense and conquered notoriety by playing with a certain unexpected zest the part assigned him. He was a dictator, and he bore himself like a dictator. The power of the police over the masses of the population is much like that exercised during the Renaissance in Italy by princelets of a reigning family; Devery's position was for all the world that of the ducal tyrant of some Italian State in an Elizabethan play. Being a man not without a sense for fact, he knew it; and being a man not without a sense

for the effective embodiment of fact, he suited mien and words and gestures to his rôle. The classes of society whose taste controls our printed criticism conceived differently the bearing even of a dictator; tastes differ on such points from class to class and even from age to age. What in the early Elizabethan period thrilled the auditor as the "large utterance" of men raised above the common lot of mortals, came to be derided in the mouth of ancient Pistol as King Cambyses' vein; the applauded actor of one generation was the robustious periwig-pated fellow of the next. Such a robustious periwig-pated fellow Devery seemed to the politer circles whose attention had been attracted by his emphasis; to them his dictatorial dignity appeared mere strut and bluster, the more comic for his unwavering gravity and for the disregard of the Republic's English shown in each authoritative phrase. Besides, they never dreamed that he was a potentate at all.

Mr. Devery had been for years, so far as the great public knew him, a figure for opera bouffe. He was, in the opinion of Tammany, "the best chief of police that New York has ever had;" and his language was a continuous performance in inspired mixed metaphor and Irish bull. His phrases achieved currency, in particular the phrase "touchin' on an' appertainin' to." "Touchin' on an' appertainin' to that, there's nothin' doin'," from the frequency with which he uttered it, had the success of a popular line in a comic song. From time to time he was not to be found at police headquarters, and was reported ill with an attack of grippe, or out of town. At such periods a burly figure, that Mr. Devery's most intimate friends might have mistaken for him, was likely to be discovered, very unsteady on his legs, throwing handfuls of silver among a crowd and watching them "scramble" for the pieces, or very unsteady on his seat, driving faster than the law allows and either stared at or ostentatiously ignored by patrolmen. Naturally, he was the delight of the daily prints. In the absence of a fresh rumor of disaster or victory for the troops in the Philippines, or of a strike among laborers or the formation of a trust among employers of labor at home, he was always news. They reported his phrases, and invented, hilariously, the theory of a Devery Double. He was money in the bank, or rather money at the desk, on the next Saturday, for a witty, devil-may-care horde of newspaper men, who found him easy to caricature and easy to convert into a "story" "for a filler." He took his celebrity good-humoredly; indeed, he was rather proud of it. Ridicule and attack were welcome or indifferent to him. Both were advertisement and both were homage. An anecdote will make his mode of dealing with them plain. On I forget what occasion, the newspapers that print woodcuts were all solicitous to get his photograph, and he refused to sit for them. Why, no one knows; the refusal was a whim; he would sit, or he would not, as the humor struck him. The "Commercial Advertiser" at that time had made a specialty of setting forth his unfitness for the office he held, and his fitness for the penitentiary, no less. Lincoln Steffens, then city editor of the "Commercial Advertiser," called him up on the telephone. "That you, Chief? This is Steffens. Top of the morning to you. As soon as I heard you would not let yourself be photographed, I knew you were saving the chance for me." "Well, of all the cold-storage nerve; say—you're a ripe peach!" "Sure. We give more space to you than any other paper in the city. When shall I send the photographer? Right away?" "You're on. Say, don't you want a job in the police? I need a man with a front like that!" A few days afterward the photograph was reproduced in the "Commercial Advertiser." As Deputy Police Commissioner Devery held court every Thursday, when he sat in judgment on delinquent members of the force, and made maxims for their instruction. "When ye're caught with the goods on, don't say nothin'," is a dictum that achieved instant currency. He presided like an Oriental caliph, ungoverned by law or evidence, inspired by the witticism or the irritation of the moment. A patrolman was brought before him charged with reckless shooting in the streets; the Chief glared at him. "Did you hit your man? No? Fined thirty days' pay for not hittin' him. Next time you hit 'im." Every Thursday afternoon the proceedings in his court were reported in the newspapers in the columns dedicated to comedy; every Thursday evening gentlemen in the clubs dedicated

to civic spirit discussed the disgrace to the city of having a man like Mr. Devery at the head of its police, and laughed bitterly at his judgments while they discussed him. In their indignation and disgust, no doubt, they often did him scant justice.

Devery had some seven thousand men to keep in hand, by military reckoning a brigade, and nobody has ever suggested that his hold on them was not masterly. He knew his men from helmet to shoeleather; he had been one of them; and when he gave a command, they walked in the eye of the lord. Indeed, even since he has been discharged, it is gravely believed and feared that the rank and file still take his orders. Men who have ever had a regiment to discipline and to control will not think him an absolute buffoon. As to his brutality of speech and harshness in judgment, there are few colonels—few good colonels, that is—in either the American or the British army, to go no further, who have not found both necessary. A regiment cannot be kept smart by politeness, and the men do not respect a commander who knows no better than to try politeness as an instrument of control, by way of experiment. The leading truth about Mr. Devery is, not that he was ridiculous, but that he was, in his own world, formidable. His superiors backed him up, and his subordinates were devoted to him; and even the malcontents obeyed him.

It was not until late in the winter and early in the spring of 1901 that the inhabitants of the brownstone districts, the prosperous minority in a word, received a revelation of the nature of Devery's rule and of the degree of its arrogance, and that Mr. Jerome came prominently into notice. The Rev. Mr. Paddock, who had been working on the East Side, laid a complaint before one of Devery's subordinates, Captain Herlihy, about police rule in Allen Street, the "red-light district," and was publicly cursed and insulted for his pains. Bishop Potter sent an admirably temperate letter to Mayor Van Wyck, Devery's official superior, seeking redress; but no redress was forthcoming. In their refusal to listen to Bishop Potter the administration made a mistake; they roused a body in the commonwealth to all practical intents and purposes both unaware of their existence and at a pinch more powerful than they. The Committee of Fifteen was organized to inquire into the conditions of Mr. Devery's rule. Mr. Croker, prompt to recognize the blunder of his henchmen, appointed a Tammany Committee of Five for the same purpose, putting Lewis Nixon, a notably honest man, at the head of it, and ordering it to take action before the Committee of Fifteen could complete its organization. Mr. Nixon chose to begin his investigations by a raid on an alleged pool-room at No. 20 Dey Street, and applied to Justice Jerome for a warrant; and there the defeat of Tammany in the coming election and the duel with Devery began. Mr. Jerome knew "down to the ground" the nature of "fake" or tipped-off raids. The magistrate issues a warrant and hands it to a police officer to serve it; the police officer organizes a raiding party, and sends word beforehand to the gambling-hell of the time set for the raid; and the raiding party finds a set of empty rooms, in charge, perhaps, of a facetious caretaker. Mr. Jerome was quite ready to issue warrants; but he declined to be a figure in a comedy. He made out the warrants against John Doe, put them in his pocket, and, in company with Mr. Nixon and Mr. Philbin, led a raiding party, ignorant of its destination, to 20 Dey Street, and rushed the place. "Rushing" means hustling watchmen, breaking barred doors, and a free fight, ending, possibly, in a shooting scrape, with such of the occupants of the rooms within as try to make good an escape. In an outer room dedicated to lounging and drinking, Mr. Jerome, Mr. Nixon, Mr. Philbin, and their party stumbled upon eight members of the police force detailed to get evidence against the place. These testified subsequently that they each drew fourteen hundred dollars a year from the taxpayers of the city of New York; that they had frequented that room for thirty-five days consecutively, barring Sundays, and that they were perfectly unaware of any gambling conducted in the house. In another room, where something like a hundred men had been rounded up and reduced to submission, Mr. Jerome gave an officer the warrants to serve and opened court.

Conducting raids in person and opening court informally in gambling-hells were unprecedented departures from the decency and decorum prescribed by public

opinion to a magistrate. In this, the first instance of such departure, he had scarcely declared the room in which he sat a court-room and himself a judge presiding, when a man, perfectly well known to the invading party, detached himself from the crowd, and said, *sotto voce:* "Mr. Jerome, I can't afford to be caught here; you must help me get out." "You don't seem to understand that this is a court-room. Hold up your hand and be sworn." The man hesitated. People who have talked with Mr. Jerome only in clubs have never met the judge. His manner in court is exceptionally tranquil and unassuming; but every spectator knows himself to stand in presence of the power and dignity of the law. "You can take your choice, and take it quickly: go to jail for contempt of court, or hold up your hand." The man held up his hand and was sworn. "What is your name?" "John Doe." "I shall be obliged to commit John Doe to the House of Detention in order to find him when I want him. I do not know his residence." Then the unwilling prisoner told his name: he was Maurice Holahan, President of the Board of Public Works. He explained to the newspapers the next day that he had gone to 20 Dey Street looking for his "wayward son." Neither the newspapers nor the public took the explanation seriously, and the wayward son was indignant. Indeed, the town shook with irreverent laughter, and the wayward son made undutiful revelations about certain of his father's dealings in contracts with the city.

This was the first of Mr. Jerome's John Doe raids. The Committee of Five never asked him, or any one, for another warrant. The little comedy Mr. Croker had planned turned suddenly too grave for his taste, and the Committee of Five ceased to exist. The Committee of Fifteen awoke to the fact that they had found a man precisely suited to their needs. They were non-political and non-partisan; they were in search of information about the actual conditions of police rule in New York City; when their informants led them to believe that a place should be raided, they applied to Mr. Jerome for the warrants. The hunting of John Doe was undertaken in earnest, with Mr. Jerome as chief huntsman. John Doe was Mr. Devery, as supposedly the official head of the system of blackmail by the police; but any confederate or subordinate of his was welcome game. In view of the current belief that gambling in the city was in the hands of a small syndicate of Mr. Devery's intimate friends, it was determined to make gambling-houses the main objective of the raids. The keepers of the gambling-houses were not themselves the men wanted; they were taken into custody and prosecuted mainly in the hope that some of them would turn State's evidence. They had paid their money for protection; it was hoped that when they found the police could not deliver the goods, they would rise against their blackmailers.

Through the spring and summer months, night after night, the raids went on, Mr. Jerome risking his life freely among the least scrupulous class in the city. He had not sought the position of chief huntsman or its notoriety. He was not a professional reformer or an aspirant for political advancement; he was ostensibly a club-man and man about town like another. As a Deputy Assistant in the District Attorney's office, and later as a Judge, he had learned the police game; he was, at once by knowledge and position, the one man who could and would do the work cut out for the Committee of Fifteen. Conducting a raid, examining the prisoners, waiting at the police station afterward for such of them as could secure bail, meant commonly staying abroad all night; and his official duties required him to open court in the Special Sessions at ten the next morning. His fellow club-men criticised him for making himself conspicuous. His brother lawyers and judges criticised him for "lowering the dignity of the bench." The newspapers caricatured him as Carrie Nation Jerome with a little hatchet. No doubt he enjoyed certain incidents in many of his nights; but the man who enjoys leading or assisting in a raid must be of an adventurous sort. It is the custom in raiding to send two or three men in advance whose business it is to mix with the players. On the first notice that the rush has begun, they are two or three against a hundred; they must hold the crowd from escaping by door or window. On battering down the door of one pool-room, Mr. Jerome discovered on the inside one of his own men, Hammond, with a prisoner in his left hand,

a prisoner and a revolver in his right, struggling forward to the arrest of a third. McLellan, another of his assistants (who was held for examination before a magistrate for having shot, on a more recent raid, a man who had fired twice at him), was on three occasions overpowered and beaten to a pulp before the rest of his party outside could break in and come to his assistance. More than once Mr. Jerome himself was obliged to bear a hand in a free fight before he could open one of his phenomenally informal courts. At times, of course, the raid ended in pure comedy. One evening Mr. Jerome and his party took by storm an absolutely empty house. The appurtenances of gambling were in evidence, but the John Doe warrants remained in the pockets of the Justice; he found nobody to serve them on. He sat on a roulette-table and said: "Sporting life is checkered, but never dull; some days you can't lay up a cent;" when there blew in from the street a young exquisite, who, at sight of his hosts, looked as if he were taking the count in order to get his bearings. "I—I beg pardon," he said, vaguely. "Not at all," said the Judge; "we were just waiting for you. I am Judge Jerome, and this is a court in session. Hold up your hand and be sworn. Tell the truth and no harm will come to you. Try on any nonsense and you will pass the night in the House of Detention. You can take your choice." As a bystander said, the young exquisite "sweated tacks," and was sworn. Before he could be asked a question, he turned to one of Mr. Jerome's party and said hurriedly: "I say, old man, can you give me a cigarette? Thanks. By Jove, I need one!" Then he told all he knew.

In the course of these raids there were for the police many unlucky accidents. There was a raid, for example, on a place called the Webster House on Third Avenue. Some thirty or forty taxpayers in the neighborhood had in a petition "humbly prayed" the police captain of the precinct, Captain Gannon, to suppress the joint, on the ground that their property was being injured by its proximity to the Webster House, and that their women could not go to and fro of an evening past the house without being insulted. The petitioners, failing to obtain redress from the Captain, applied to the Committee of Fifteen. In the raid that followed Captain Gannon was surprised taking his ease in a back room of the place, and it subsequently appeared that he was an habitué of the Webster House. It is an incident that makes a picture. And Devery, in his judgments from week to week in the travesty of a court he presided over, added the finishing touches; dashed them in with a reckless security that made even his own admirers gasp. One patrolman, McManus by name, came up before him during the raids, on the charge of absence from duty without leave. The known facts in the McManus case were these. A married man, he had some years before abandoned his wife and allowed his three children to be supported for four years in a charitable institution maintained by the city. During all this time he was an officer on the force. It had been charged that he had seduced a fifteen-year-old girl, taken her from the house of her parents, and was living with her as his mistress. For this he was indicted and tried for rape and seduction by the county authorities, and on the trial the jury disagreed. Men familiar with the trials of members of the police force can read between the lines. He was tried also at Police Headquarters for conduct unbecoming an officer and a gentleman, and after the evidence was put in decision was "reserved." It was on record also that he had once been dismissed from the force for intoxication, but, without reason given, had been reinstated. Finally the Gerry Society had caused him to be arrested for failure to support his children, and the trial took place in the Court of Special Sessions at a time when Mr. Jerome happened to be presiding justice. Mr. Jerome and his associates on the bench sentenced McManus to three months in the penitentiary. It was on his release that he appeared before Devery on the charge of being absent from post without leave. He might have pleaded that his absence was unwilling and unavoidable, but he did not. He pleaded, when Devery had lost his temper and was to all seeming on the point of passing heavy sentence on him, that he had been sentenced to the penitentiary by Judge Jerome. Devery's mood changed. Two days before, Mr. Jerome, in one of his raids, had captured an especially significant check drawn to the order of and cashed by Frank Farrell, one of Devery's inti-

mates and an alleged fellow-member of the gambling syndicate. "Judge Jerome," Devery mused. "This complaint is dismissed! There is a lot of little tin soldiers runnin' around this town with popguns on their shoulders, shooting them off in the streets, raising riots and degrading the community. I say it's an outrage. Judge Jerome isn't goin' to run this town if I can help it. This man here claims that he was wrongly convicted, and I believe him. It is about time a halt was called on Judge Jerome." McManus, when arraigned before Mr. Jerome and his associates, had pleaded guilty. After Devery's decision he drew his pay for the three months during which he had served the city in the penitentiary.

To rich New Yorkers and to rich men everywhere the fact is seemingly a novelty, and even a paradox, that the administration in great cities means one thing to the rich and quite another to the poor. To the rich it means, in practice, customs-house officials, lawyers, judges in the higher courts, tax-gatherers, and, in the case of the very rich, legislatures, Congressmen, and Senators. To the poor it means the policeman on the beat, the police captain in the precinct, the district leader and his heelers, and the nearest police magistrate. To the women of the rich the policeman is almost a domestic servant, to whom they can appeal for aid and protection, and in whose presence they feel a sense of safety; they appeal to him and say, "Thank you so much," with a sense of conferring a favor; and "Chief of Police" is to them the title of a vaguely conceived petty official. To the women of the poor a policeman is a sentinel of a garrison—at least professedly a friendly garrison—that has quartered itself upon the city, and holds it in subjection under military law; and the Chief of Police is a remote and awful military dignitary of undefined powers. If the sentinel is good-natured and sober, he can be appealed to in case of need with some chance that he will throw his power into the scale of justice. If he is ill-natured, or drunken, or venal, there is indeed a bare chance that an appeal to his superiors may bring him a rebuke, but more than a rebuke is scarcely to be hoped for; neighbors and friends are slow to testify against the police for obvious reasons, and all who know the police know how difficult it is to force one of them to testify against another. I have seen the big fellows blush like girls, and wipe off the cold sweat that started to their faces, at the lies they were telling to shield a comrade—lies perfectly patent under cross-examination; but I have never seen one of them break down. And so long as the man complained of remains in authority, there is small limit to his power to be avenged on the complainant. He can take any woman on the streets into custody and charge her with "soliciting." He can take any man on the streets into custody and club him, and charge him with having been drunk and disorderly, and with having resisted an officer in the discharge of his duty. Except by mistake, such arrests and charges do not befall the rich. The rich have money with which to pay for a fight; the rich have money with which to bring witnesses to their social position, and to bring bondsmen to give bail for them; and at the first credible intimation that a mistake has been made about the wealth and social position of a prisoner, the police are all apologies, contrition, and courtesy. The poor have no money with which to pay for a fight, or to bring witnesses, or to indemnify bondsmen; and their witnesses, who would gladly come forward on a guarantee of impunity, cannot afford, on penalty of sheer hunger, to miss a day's work, and cannot afford, on grounds of personal safety, to appear against an accusing policeman. Even when the policeman's immediate superiors are honest, the poor had better, ninety-nine times out of a hundred, in wisdom for themselves, submit than fight; and they do submit. When the policeman's superiors, as in New York City, are, as a rule, more corrupt and brutal than himself, the case of the poor is little short of desperate. Gamblers, the keepers of dives and brothels, criminals generally, have ready money and pay it, and are relatively safe. The poor are safe only in so far as they are inconspicuous; and known savings, for example, or a strikingly handsome wife or daughter, suffice to render them conspicuous. Well-worn instances of Roman or Italian tyranny are re-enacted in New York with variations; the old materials of tragic drama lie ready to the playwright's hand. No one who knows anything of the extent

to which the privilege of theft and robbery is a matter of bargain and sale, and anything of the extent to which the "cadet system" has prevailed, will find these statements exaggerated. The hunting of John Doe did not achieve its ostensible purpose; William Devery and his allies and lieutenants were still at large and still bore sway; but it made apparent in some measure to the well-to-do the nature and the abuses, possible and actual, of the power of the police.

Sir William Harcourt[1]

By Justin McCarthy

EVERY friend and admirer of Sir William Harcourt must have been glad when it was made known that the late leader of the Liberal party in the House of Commons had declined to accept the King's offer of a peerage and was determined to remain in that representative chamber where he had made his political name and won his place of command. Sir William Harcourt would have been thrown away in the House of Lords. He could not have done anything to arouse that apathetic chamber to anything like living importance in the affairs of state, and the House of Commons would have lost its most impressive figure. Sir William Harcourt's political fame was made in the House of Commons, and he is even yet its most distinguished member. I say "even yet" because Harcourt is growing old, and has passed that age of threescore years and ten authoritatively set down as the allotted space of man's life. But he shows no appearance as yet of old age, seems full of energy and vital power, and is as well able to command the listening House of Commons by argumentative speech and impressive declamation as he was twenty years ago. Harcourt's bearing is one of superabundant physical resources, and he has a voice of resonant tone which imposes no tax on the listening powers of the stranger in the farthest gallery. He is a very tall man, would be one of the tallest men in any political assembly, and his presence is stately and commanding. After Gladstone's death he became the leader of the Liberal party in the House of Commons, and he resigned that position only because he could not cordially accept the policy and plans of action undertaken by his leader in the House of Lords, Lord Rosebery. I do not propose to enter at any length into the differences of opinion which separated these two men, but it was generally understood that Lord Rosebery did not see his way to carry out Gladstone's policy for the maintenance of Greece and the Christian populations generally against the blood-stained domination of the Ottoman power in the southeast of Europe. The result of these differences was that Lord Rosebery applied himself to form a Liberal party of his own, which should be what is called Imperialist in its policy, and that Harcourt became merely a member of the Liberal opposition in the House of Commons. To have won the place of Liberal leader in the representative chamber might well have satisfied the ambition of any man, and to withdraw from that place rather than contribute to any further disagreement in the party did not in any sense detract from Harcourt's influence and fame.

Sir William Harcourt won his earliest distinctions in law and literature rather than in politics. He comes of a family which has a history of its own and had members who won reputation during many generations. He was educated at Cambridge University and obtained high honors there. He was called to the bar in 1854, and became Queen's Counsel in 1866. In the meantime he had accomplished some important literary work. He was a writer for the "Saturday Review," then at the zenith of its reputation, and under the title of "Historicus" he contributed a series of letters on important public subjects to the "Times" newspaper which attracted universal attention, were afterwards collected and published

[1] This article is the seventh of a series about living British statesmen. In preceding articles Mr. McCarthy has written of Mr. Balfour, Lord Salisbury, Mr. John Morley, Mr. Henry Labouchere, the Earl of Aberdeen, and Mr. James Bryce. Other subjects will be Sir Henry Campbell-Bannerman, Sir Michael Hicks-Beach, Mr. John Burns, and Mr. John E. Redmond.

in a volume, and found readers in every part of the world where men take interest in the public life of England. He was a leading advocate in some legal causes which excited the profound attention of the whole country, and was already regarded as a man of mark, who might be safely assumed to have a successful career before him. It was generally taken for granted at the time that such a man was certain to seek and find a place in the House of Commons, which of course offers an opening for rising legal advocates as well as for rising politicians. I can remember quite distinctly that to all of us who were watching the careers of promising men it appeared quite certain that Harcourt was not likely to content himself with professional distinction, and that when he entered the House of Commons he would devote himself for the most part to the business of political life. He made one unsuccessful attempt to obtain a seat in the House of Commons as representative of a Scottish constituency, and was more fortunate in his second endeavor, when he was elected to Parliament by the city of Oxford as a Liberal in 1868. Then for a while I personally lost sight of him, for towards the close of that year I began a lengthened visit to the United States, and only learned through the newspapers that he was already winning marked distinction as a Parliamentary debater. When I returned to England in 1871, I found that Harcourt was already regarded as certain to hold high office in a Liberal administration. His first step in that direction was to obtain the office of Solicitor-General in Gladstone's Government.

A story was told of Harcourt at the time—this was in 1873—which I believe to be authentic and is worth repeating. Up to this time he was merely Mr. William Vernon Harcourt, but the usage in Parliamentary life is that the leading law officers of the Crown, the Attorney-General and the Solicitor-General, shall receive the honor of knighthood. It was therefore a matter of course that Mr. Harcourt should become Sir William Harcourt, and bear the title by which he is still known everywhere. The story goes, however, that Harcourt was not much delighted with the offer of a distinction which is commonly conferred upon the mayors of English cities and towns and other such personages of municipal position. Harcourt, as I have said, came of a distinguished English family which had contributed Lord Chancellors and other such exalted dignitaries to the business of the State. He probably had also in his mind the fact that rising men in his own profession who happened to be sons of Peers were specially exempted by constitutional usage from the necessity of putting up with knighthood when accepting one of the two legal offices under the Crown. The manner in which this very fact proclaimed the comparative insignificance of the title may have still further influenced Harcourt's objections. Anyhow, he did endeavor to impress upon Gladstone his claim to be exempted from the proffered dignity. Gladstone, however, assured him that it was the recognized constitutional practice to confer a knighthood upon a new Solicitor-General, and that there was no reason why Harcourt should seek dispensation from the honor. "Then," demanded Harcourt—so at least the story is told—"why don't you confer knighthoods on all the members of your Cabinet, and see how some of them would receive the proposition?" I cannot vouch for this story as historical truth, but I can vouch for the fact that it was told everywhere at the time, and received, so far as I know, no contradiction.

Harcourt made his way almost at once to the front rank of Parliamentary debaters. His style was somewhat rhetorical and declamatory, but it was distinctly argumentative, and his speeches contained few passages of mere declamation. He was a hard hitter, one of the hardest in the House, but he hit straight from the shoulder and never gave an unfair blow. He was often very happy in his sarcastic touches, and there was a certain robust and self-satisfied good humor even in his severest attacks on his Parliamentary opponents. The general impression of observers at first was that Harcourt would go in merely for the reputation of a powerful debater in the House of Commons, and would not show any ambition for the steady and severe work of Ministerial office. The public had yet to learn that the highest reputation of the man was to be made by his success as the head of a great Ministerial department. Many

observers also formed the opinion that Harcourt had no clear political views of his own, and was merely a sort of free lance ready to accept employment under the most convenient leader. He had entered the House of Commons as a Liberal, and even before he accepted office had always ranked himself as a regular supporter of the Liberal party, but he often made speeches in opposition to the views of extreme Liberals or Radicals—speeches such as might well have been made by some eloquent member of the Tory party. Many of the more advanced Liberals had for some time no confidence whatever in Harcourt's Liberalism, and were often engaged in sharp controversy with him. My own impression is that, up to a certain period in his career, Harcourt had not formed, or troubled himself to form, any very settled opinions on the rising political questions of the day. Upon all the old subjects of political debate, on the controversies which divided political parties in a former generation, his views were, no doubt, quite settled, but then there were many new subjects coming up for discussion, bringing with them new occasions for political division, and it is quite probable that on some of these at least the new Solicitor-General had not quite made up his mind. He had been a close student at Cambridge, and had been elected professor of international law by that University; he had practiced law as an advocate, and had begun to make a reputation for himself as a writer. It is quite probable that he had not yet given any special attention to some of the new questions which the growing development of social and political conditions was calling up for Parliamentary consideration.

Harcourt appears to have accepted as a matter of course, when he entered the House of Commons, the recognized principles inherited by the Liberal party. But there was then, as at most other periods of England's constitutional history, a new and advancing Liberal party beginning to make its influence felt, and not satisfied to abide by the mere traditions and established canons of the older Liberalism. Only a very few even of the advanced Liberals were yet prepared to support and encourage the Irish demand for Home Rule, and on such domestic questions, for instance, as the regulation of the liquor traffic, the Liberal party in general had not made up its mind to any policy other than a policy of mere inaction. I mention these two subjects in particular because they have an especial value in throwing light upon the change which took place more lately in Harcourt's political attitude. Probably at the time when he first entered the House of Commons he had not concerned himself much with the Home Rule question, and had allowed himself to take it for granted, as so many even among Liberal politicians and newspapers would have told him, that the Irish Home Rulers were aiming at the break-up of the Empire. In the same way it is quite possible that he may have given little or no attention to the demand for some new regulation of the liquor traffic, and dismissed the whole subject as a crotchet of Sir Wilfrid Lawson. When, however, he began to study the political life of the House of Commons as an active and a rising member, and when he found that his inclinations and his instincts were leading him into politics and away from law, we can easily understand that he set himself to study with candid judgment the new questions which were beginning to divide the Liberal party. I have often heard Sir William Harcourt accused of inconsistency and even of time-serving, because of his sudden conversion to the principle of some political movement which was at last coming to be accepted by the great Liberal leaders. I do not see any reason whatever to believe that Harcourt can fairly be reproached with inconsistency, or can be justly accused of any ignoble motive for his adoption of the newer and more advanced opinions. The explanation seems to me quite clear. The university student, the practicing advocate, the professor of international law, adopted a new career and devoted himself to an active part in the work of the House of Commons. Then it was that he studied for the first time with earnestness and impartiality some great developing questions which had previously been mere names and shadows to him, and thus he came to form the conclusions which guided his subsequent career. If Harcourt had been thinking chiefly of his own political advancement, he might have done better for himself by following the example of Disraeli, and taking a place among the

Tories, where intellect and eloquence were more rare than on the other side of the House, and where promotion was therefore more easily to be won.

Harcourt had probably not given much attention to great financial questions until he came under the influence of Gladstone. Up to that time he had, perhaps, not assumed that such subjects were likely to come within the scope of his practical work; but when he had to study them, he began to discover that he had within him the capacity for a thorough comprehension of their real meaning and development, and as the result of the study he became, when the opportunity offered itself, one of the most successful and enlightened financial Ministers of his time. In the same way he had, perhaps, never given any serious thought to the question of Irish Home Rule, and had fallen quietly into the way of regarding it, in accordance with the common opinion of most Englishmen just then, as something naturally associated with a rebellious desire for the breaking up of the Empire. When, however, he was led to study it as a question of reasonable import, he grew to be a convinced and a hopeful advocate of the cause. For a long time after he had taken office under Gladstone he found himself brought into an incessant opposition and even antagonism to the small group of Irish members, who then represented the Irish national demand, and compelled to fight against the obstruction which these Irish members were raising night after night, as their only means of enforcing public attention to a serious consideration of Ireland's national complaints and claims. He became converted to the cause of Home Rule, just as Gladstone did, by having the question forced upon his consideration, and thus being compelled to ask himself whether there was not some real sense of justice inspiring the Irish agitation.

I shall always remember a conversation I once had with Gladstone on this subject of Irish Home Rule. It was in one of the inner lobbies of the House of Commons, and Mr. Gladstone began it by asking me how I could regard Home Rule as a national demand, seeing that only a very small number of the Irish representatives in the House were actively in favor of such a measure. Gladstone called my attention to the fact that out of the whole body of Irish representatives elected by the constituencies on the same basis of voting, less than a dozen members declared themselves uncompromising advocates of Home Rule. I drew Gladstone's attention to the fact that the suffrage in Ireland was so high and so restricted that the whole bulk of the Irish population were disqualified by law from giving a vote at any election. Gladstone appealed to me to say whether he had not long been in favor of an expanded suffrage for the whole Kingdom, and I told him that I cordially recognized his genuine purpose, and that whenever we got a really fair and popular suffrage he would then find ample proof that the great bulk of the Irish people were united in their demands for Home Rule. Not long after, it came about that Gladstone and his Government saw their way to a measure of reform which gave the whole Kingdom an expanded and popular suffrage, and at the next general election the great majority of Irish members opposed to or lukewarm about Home Rule disappeared altogether from Parliament, and their places were taken by avowed and genuine Home Rulers elected mainly because they were earnest advocates of Home Rule. Out of the hundred and three members who constitute the Irish representation, we had then nearly ninety who were proclaimed and consistent Home Rulers. This result did much of itself to make Gladstone a convert to Home Rule, and it had naturally the same effect on Harcourt, who was far too intelligent a man not to accept the lesson taught by the Irish constituencies, and to admit that the demand for Home Rule was a genuine national demand, and as such entitled to the serious consideration of real statesmen. The conversion of Harcourt I have always, therefore, regarded as sincere and statesmanlike, and of the same order as the conversion of Gladstone himself. The first business of statesmanship is to recognize established facts and to act upon their evidence. Once the demand had been proved to be national, neither Gladstone nor Harcourt was the man to deny it a full consideration; and the same full consideration made the one man and the other an advocate of Home Rule.

In the days before the great constitu-

tional change which I have described, the change which resulted in the adoption of a popular suffrage, in the days when our small band of Irish Nationalists was still doing battle inch by inch against the Government, we had many fierce struggles with Harcourt, then a leading member of the Liberal administration. We had to admit that we found in him a powerful antagonist. He was ready in reply, resolute in maintaining his position, and he gave us, to say the least of it, as good as we brought. He was ever alert, he could answer attack by attack, he could carry the battle into the enemy's ranks, and the ablest of our debaters had his best work to do when compelled to stand up in Parliamentary contest against Harcourt. But I always observed that in our private dealings with Harcourt, on questions which came within the range of his administrative functions, we always found him considerate, kind, and even generous. There are frequent occasions when a Minister of the Crown had to be applied to by an Irish member for justice in the dealings of his official department, where individual questions of right and wrong having nothing to do with the general subject of Home Rule came up for consideration. I am now speaking of questions which were not to be settled by mere debate in the House of Commons, but which belonged to the ordinary and practical dealings of the department with this or that individual case. I can remember many instances in which I had to make some such appeal to Sir William Harcourt, and I always found him most ready and willing to consider fairly the nature of any individual grievance, and to prevent the administration of the law from being perversely turned into an engine of oppression. I know that many of my colleagues as well as myself felt thankful to Harcourt for his prompt interference where a genuine grievance had been brought under his notice, and for his resolve to see that justice must be done to the obscure sufferer from official tyranny. When the Liberal Government and the Irish National party came to work together for Home Rule, we, the Irish National members, had nothing on our memory which could prevent us from regarding Harcourt as a genuine Liberal and a sincere friend who had never shown any inclination to abuse his power when he was strong and we were at our weakest. My recollection of the days when we were fighting against Harcourt is tinged with no bitterness. He was always a formidable fighter, but he fought fairly when he still had to fight against us.

It is not surprising that Harcourt should have been for some time regarded as a powerful debater and nothing more. He was one of the foremost debaters in the House of Commons, even at a time when that House had more commanding debaters in it than it can claim to have just at present. He cannot be ranked among the great orators of the House. He is wanting in imagination, and without the gift of imagination there cannot be eloquence of the highest order. Even in the mere making of phrases he has seldom shown originality, and it has often been remarked of him, as it was remarked by Disraeli of Sir Robert Peel, that he never ventures on any quotation which has not already well established its popularity. Sir William Harcourt's best qualities as a speaker consist in his clearness of exposition, his unfailing fluency, his masterly array of forcible argument, and the fact that he never allows his eloquence to soar over the heads of his audience. I should be inclined to say of him that, although he is unquestionably a great Parliamentary debater, yet his intellectual capacity, his faculty for balancing evidence, acquiring and comparing facts, appreciating tendencies, and coming to just conclusions, are greater even than his powers of speech. I may say that one who listened to Sir William Harcourt during the earlier stages of his Parliamentary career might very naturally have been led to quite a different conclusion, and might have set him down as a clever maker of speeches and not a statesman. But such an observer, supposing him to be endowed with a fair amount of intelligence, would have gradually changed his opinion as he followed Harcourt's political career. Every time that Harcourt has been in office he has more and more given proof that there is in him the genuine quality of statesmanship. He served as Home Secretary under Gladstone, and was afterwards Chancellor of the Exchequer, first in one of Gladstone's administrations and afterwards in the Government of Lord Rose-

bery. There can be no question that he proved himself to be one of the greatest financial Ministers England has had in recent times. His famous Death Duties budget, introduced while Lord Rosebery was Prime Minister, created one of the most vehement controversies known to the political life of the present generation. Yet the great principle which Harcourt embodied in his dealing with the question of death duties must now be regarded even by his political opponents as resting on a basis of absolute morality and justice. The principle merely was that the amount of taxation which any individual pays to the State in consideration of his having obtained property by bequest shall be greater in proportion according as the acquired property is great in amount. In other words, Harcourt's policy maintained that a man who comes in for a large property as a bequest shall pay a larger proportion of taxation to the State than a man who comes in for a small property, and that the same principle ought to prevail through our other systems of direct taxation. The whole controversy simply turns on the question whether the rich man ought or ought not to pay a larger proportion of his income to defray the national expenses than the poor man—whether the citizen who has only income enough to enable him to maintain his family decently ought to be called upon to pay towards the maintenance of the State on just the same scale as that ordained for the man who can live in lavish luxury. The boldness and originality of Sir William Harcourt's venture in his budget of 1893, the energy and argumentative power with which he carried it to success, have undoubtedly secured for him a place in the front rank of England's financial Ministers. The later years of Harcourt's career offer a strange commentary on the estimate generally formed of him when he began to be conspicuous in Parliament. At the former period he was commonly regarded as a clever but somewhat superficial man, as one whose qualities were rather flashy than sound, as a ready maker of telling speeches designed to produce an immediate effect and destined to be utterly forgotten the day after to-morrow. Harcourt's later years of public work have proved him to be a serious Parliamentary leader, a man of strong and deep convictions, a man who thinks before he speaks and speaks because he thinks.

Indeed, the seriousness of Harcourt's convictions on some subjects of National importance has brought him more than once into disfavor with his constituents. He holds very strong and advanced views on the subject of local option—that is to say, on the right of localities to say whether they will or will not allow the sale of intoxicating drinks within their confines, and to state what conditions are to be imposed on the traffic if it is permitted at all. Sir William Harcourt went further on this subject than som even among his colleagues who were in favor of the general principle as a principle, but did not see the necessity for pressing it to immediate action. One of those colleagues said to me that in his opinion Harcourt might very well have allowed the question to stand over for eight or ten years, and perhaps by the end of that time the habits of the population would have improved so far as to render the passing of any strong restrictive law unnecessary. I am quite certain that Harcourt's earnest resolve to deal boldly with this subject if he should be allowed the opportunity had much to do with the condition of feeling in the Liberal party which led to his resignation of its leadership. We may look forward with confidence to the formation of a new Liberal Government in which Harcourt will have a commanding position, and when that time comes we may take it for granted that, in spite of whatever opposition on either side of the House of Commons, he will once more attempt to deal with the question of local option.

Most of my American readers know that Sir William Harcourt's second wife was the daughter of Lothrop Motley, the famous historian who was for a time Minister to Great Britain, and died at Harcourt's country residence in 1877. The eldest son, Lewis Vernon Harcourt, who was born in 1863, has also married an American lady. The younger Harcourt, whom I have known since his boyish days, is endowed with much of his father's talents, and I have always thought that if he had devoted himself entirely to political life he might make for himself such a career as his father has already accomplished. During contested elections I

have been more than once associated with the younger Harcourt in "stumping" some parts of the country on behalf of the Liberal Government then engaged in the cause of Home Rule, and I have the clearest memories of his remarkable organizing capacity, his ready eloquence, and his skill in replying to questions and arguments and in convincing skeptical voters. I take it for granted that every one who has known Lewis, or, as he is commonly called, "Lulu" Harcourt, must have delightful recollections of his bright companionship. We have all heard that Sir William Harcourt studiously consulted his son when the offer of a peerage was made to him by King Edward, and that "Lulu" was resolute in supporting his father's desire to refuse the honor, even although his acceptance of it would have made "Lulu" the heir to a peerage. Sir William Harcourt, we may well hope, has yet good work to do in the House of Commons. There is nothing about him which suggests the idea of advanced years or of decaying powers, whether mental or physical. The curious attack of weakness which lately came over so many members of the Liberal party never touched his robust intellect and resolute character. No man could render more valuable services than he may be expected to do in turning to account for genuine Liberalism the reaction already beginning to set in against the reign of the Tories and the Jingoes. I cherish the belief that the best of Sir William Harcourt's work is yet to be done by him.

The Possibilities of Peat

By S. Power

THIS New Year's Day, 1903, smiles sunnily on a curious, uncomfortable, unnecessary condition of affairs. The richest country in the world has its commerce, its manufactures, and its homes practically at the mercy of a few operators in fuel. This article is written in a writing-room of a hotel, because the home order for fuel paid for ten days ago has not been delivered, and the domestic shortage allows fire only nights and mornings. My lawyer, in good practice, yesterday owned to highly pessimistic feelings in view of the fact that he had just paid for twenty-eight tons of coal at fourteen dollars a ton. He does not know how fortunate he is to get it at all. New England churches suspend service, New England manufacturers are walking the floor in dread of being compelled to shut down their mills for want of coal just when our export trade needs nursing to hold its own. People sent Christmas boxes of home cake, nuts, and confectionery to friends, and the prettiest bonbonnière was full of nut coal, carefully washed and dried. With the cover closed the enamel box went on with the dessert—a joke which has had a famous run these holidays.

At the first cold snap the University Settlement sent around to the Young Women's Christian Association and other institutions to see if they could sell any coal to help out the Settlement's shortage. The "Young Woman's," as it goes among its frequenters, has the right sort of an engineer, who buys its coal by the boat-load and gets it at $3.20 a ton this season of scarcity. His dynamos burn "buckwheat" fine coal just as the great electric power and light companies use it. There is coal *en route*, we are told, but the mere transit after the stagnant months of strike almost blocks trade. The ocean liners contract by the year for coal, and each steamer of the crack lines must have at least two thousand tons for a week's run. Five million families must have at least a half ton a month each or shiver. That is the least amount by which one small fire can be kept with economy. Multiply it and see what amount must be moved weekly to keep this country going. The coal-trucks must roll steadily each hour of night and day on the railroads to keep our American world of business and its cooking fires supplied. Chill is as deadly as freezing, though its effects are slower. The colds taken in fireless street-cars, in chilly rooms and draughty shops, swell the death-rate under various other names

of resulting diseases. The people die and make no sign.

It is all so useless, the complications of trade and the suffering of humanity. New York City shivers and complains, with deposits of the best fuel known in two hours' reach, sufficient to keep its fires for two generations. New Jersey has enough to last a century; Chicago fumes over its coal famine with beds of the richest gas-fuel almost within the city limits; Wisconsin valleys are filled with it; Indiana might supply her neighboring States with firing and not feel it; St. Paul has fuel-beds to last her fires indefinitely. Of course this fuel is the despised, little-understood peat. Really, one might put in a cup of tea all that people know about one of Nature's best gifts, which will play no insignificant part in human affairs for the coming century. The wireless telegraph is of less importance.

Peat is the deposit of dead swamp moss and other bog plants charged with carbon, often with bitumen. The swamp moss, one of the most enduring plants known, will hold two hundred times its own weight of water, and its earth holds eighty to ninety per cent. Dry the sods in the air and they burn so well that a ton and four-fifths equals a ton of coal for heating purposes. That is to say, it has about half the heating power of good coal and more than twice the heat of wood. If a measureless supply of wood existed within two hours of the city, to be had for cutting and hauling, we should feel easy on the fire question. Years since a careful State geologist estimated the peat along the Hudson River through Westchester and Rockland Counties at over two million cords, with better yield in the interior of those counties. New York City has dug out and thrown into the bay from its own subsoil peat enough to keep its fires going all this winter. The subway cuttings come upon it every little while, and the Irish workmen carry home sods of it to burn for the sake of the old country. The writer took a turf uptown from the cuttings at the Tombs Power Station, and it made incense in a bedroom grate for days. It was not dry, yet it burned and gave heat. But what was most curious and delightful was its aroma, like that of pines in the noonday sun. Its soft, purifying effect on the air, due to its moist, antiseptic property, soothed irritable lungs and made breathing easy. Enough had been read and heard of the "glowing fires of peat," but the charm of its subtle odor and the soft purity of its air were a novelty.

Old men who remember the peat fires of the Civil War and after, when coal waxed high and scarce, are enthusiastic over the lasting, summer-like heat diffused by burning turf. Between 1860 and 1875 some forty-six firms began to cut peat in New York, New England, and Ohio. It was everywhere liked as a household fuel, and it raised steam admirably, but it was not understood that it needed different firing from coal or wood. Above all, the supply was not adequate for railway and factory purposes, with the few and scattered companies raising peat at any one time. It was as if twenty small mines had to furnish all the coal wanted for the country to-day, or as many country mills grind all its flour. So peat fell back into disuse, railways bought their own coal-mines and worked or leased them, and every one else bought the fuel offered, wood or coal. Housekeepers would not look at coal as long as wood was five dollars a cord, and it took forty years to bring the public into the use of hard coal. It was held in the same contempt which peat now receives, as a makeshift for those who could afford nothing better. Let us learn the facts about this despised clod fuel.

The American Society of Mechanical Engineers, which will be recognized as sound authority, in its boiler tests rules one pound of dry wood equal to four-tenths of a pound of coal for making steam. That is, two and one-half tons of pine wood, a little over two and one-eighth cords, give the same heat as a ton of hard coal. Common air-dried peat gives the same heat with one and four-fifth tons. That is, again, common dry peat turf throws out more heat than the same amount of best oak or beech cord-wood. The average heat given by the best soft coal is 13,600 thermal units, that of dry peat 9,400 units, per pound. But there is such a thing as prepared peat, ground to pulp like wood fiber for paper, the water extracted by ventilator fans, and the pulp pressed into blocks three by four inches,

hard as coal and clean as tile, yielding more heat than ordinary hard coal.

The Continent is far ahead of this country in the development of peat fuel. The Russian Government, aware that its oil-wells in southern Russia cannot meet the service for ships and railways, has hundreds of excavators at work in the peat bogs along the railway between St. Petersburg and Moscow, raising and pressing fuel for the locomotives. Alert little Finland and the Caspian order vessels and locomotives to burn peat when in shed or harbor. Sweden outdoes the world in fuel enterprise, for not only are its briquettes the best made, but its Royal Peat Association held a Peat Exposition last year, which showed twenty-four varieties of native peat, besides briquettes from Russia, Germany, and Holland, and the turf grown by the Peat Cultivation Society. Peat can be grown from Sphagnum and Hypnum swamp mosses in twenty-four years, although the vast deposits existing in the world began when mammoths had the globe to themselves. The exposition also showed quantities of by-products from peat, which equaled in variety the derivatives from coal—paraffine, acetic acid, peat spirit, peat tar, and ammonia in the list. It is not out of the way to consider peat as an unfinished coal mixed more or less with petroleum, the villainous smell left out. According to master engineers, two million tons of prepared peat have been used yearly in Swedish works.

Few regions north of the Carolinas are without a plentiful peat supply within a radius of fifty miles, and where this is the case it is cheap and beneficial to use common air-dried peat for household fires. It has a hundred good qualities besides its heating property. It does not dry the air as coal fires parch it, and long experience shows that its antiseptic quality prevents consumption and relieves it, like the air of pine forests. Consumption is practically unknown in peat-burning districts, and the lovely complexions of Irish and Swede women are largely due to the moist pure air of peat fires. Peat charcoal is a notable disinfectant, and late researches of Continental chemists prove that the cholera bacillus cannot survive where it is used. The value of peat ashes in manufactures and as a fertilizer equals its worth as a fuel. The ash di courages insect pests in orchard and ga den; it nurtures the short, sweet pastu which feeds high-flavored mutton and fi wools, and makes the richest sward f lawns. Every inch and fiber of a pe bog has its value. The water from pe streams keeps sweet on shipboard roun the world. The fibrous upper layers turf, least considered for fuel, whe ground with asphalt make the most e during, elastic street pavement. Car fully burned, peat produces a charco worth five times as much as wood cha coal for the highest uses in manufacture and the arts.

If asked why this has not been know sooner, it is answered that the facts hav been known for a hundred years, but th world is too taken up with what comes t hand to notice anything outside its imme diate vision. Oppressive dispensation are needed to make nations recognize th resources of Nature. Starvation teache the worth of maize and potatoes for food, and the coal famine brings to light the unsuspected values of a dozen fuels— coal-slack, lignites, briquettes, and nativ peat. It is said, by those who should know better, that the cost of manufacturing peat is too great to permit its use. But while this is said by those who should know better, we have it on the best authority of mechanical and civil engineers, of scientific institutes and trade reports, that it is made on the Continent, ground and pressed, at sixty cents a ton; and this side of the water an enterprising firm is turning out thousands of tons of finished peat weekly, at a cost of $1.75 a ton, including royalties. This is for the finished peat, which equals coal for heating, and exceeds it in other good qualities. It is nearly smokeless, it has no sulphurous gas, it does not burn out grates and boilers, and it is as clean to handle as so much flooring tile. The notable Holland housewives are willing to pay more for it than for coal, simply because it takes less room and is so clean to handle.

When it is added that peat can be successfully worked in winter as in summer, with the aid of mechanical devices, the last objection to its use would seem to be removed. The keen-witted manufacturers of Sweden and Denmark build their factories on the borders of peat bogs for

the convenience of the fuel. The peat-turf in Minnesota and western New York is so bituminous as to take fire in the late summer and smolder slowly for months—in the Northwest burning until the snows of December put it out. It would be as well to adopt the latest Continental enterprise—building power and light stations on the edge of bogs, and transmitting power and gas to neighboring towns. Peat makes very brilliant gas, free from the malefic odors of coal-gas, at a much less expense. And the energy derived from the use of peat reduces the rate of power to one-ninth of a cent an hour for each horse-power—the computation given by a manufacturer who had installed his plant next to a peat bog. Is there nothing here to tempt the consideration of American business men?

The New International Encyclopædia[1]

THIS great work is well named. And it is international from the American standpoint on the continent which lies between the modern and the ancient seats of civilization, with the subjects of peculiar interest to Americans nearest to their eyes. It needed to be discriminated as "new" from the "International Cyclopædia" published years ago, since it is an independent and original work.

There are two distinct types of encyclopædia, represented severally by the "Encyclopædia Britannica" and by Brockhaus's "Conversations-Lexikon." The former is more suited to specialists than to the general reader. The latter, free from this limitation, is typically German in dry and monotonous indifference to literary form. Chambers's deservedly popular work embodies the merits without the defects of the German type, but, like the Britannica, retains too much of British insularity to be satisfactory to American needs. Several American cyclopædias, while aiming to supply its deficiencies, have made large drafts upon it.

But before the final volume of an encyclopædia is issued, its first volumes already lag behind the unresting advance of events and of learning. Not only are revisions and supplements constantly required, but new works are needed. Discovery and invention, new sciences, political and social changes, create new interests and open new outlooks upon the world of thought and the world of action. The projectors of the New International were not mistaken in judging that the first decade of the twentieth century is a ripe time for their great undertaking.

It is planned on German rather than on British lines, studious of scientific accuracy, but written for the general reader. At the same time, its principal contributors have been selected on the ground not only, as in Germany, of their special knowledge, but also of their literary style as attractive and clear. The volumes before us are a pledge that, whatever its shortcomings, ponderosity and dullness will not be among them. Reference is here in point to the eight-page article on Architecture, with its four additional full-page illustrations, Egyptian, Greek, Mexican, and American—the latter, quite fitly, being St. Paul's in New York, with its overlooking "sky-scrapers." This reference to illustrations justifies the further remark that the New International outranks in this line all its predecessors, both in quality and in quantity, while evincing a discriminating selection. Some of the colored plates, *e. g.*, Apples, Cacti, Indian Baskets, Indian Blankets, are very fine. In its numerous maps, of course, the latest political changes are exhibited, as a glance at its Africa reveals; and one finds drawn in its Antilles all the mail steamer routes as well as the submarine telegraph lines of the present year.

The contributors announced in the first volume number a hundred, of whom three only are women, whose several topics are Biography, Consumers' League, etc., and Cookery. The fact of this disproportion must be mentioned; beneath the surface of it we leave it to Sorosis to inquire. Beyond this list no note of individual authorship appears. Those who prefer

[1] *The New International Encyclopædia.* Edited by Daniel Coit Gilman, LL.D., Harry Thurston Peck, Ph.D., L.H.D., and Frank Moore Colby, M.A. Vols. I., II., III. Dodd, Mead & Co., New York.

signed articles must respect the solid reasons given against them, of which this one is enough: that the number of revising hands through which many an article passes before it appears in the New International imparts to it a collective authorship in place of an individual.

A feature of this work convenient for the general reader, and not heretofore found in an encyclopædia, is its department of general intelligence, with a large variety of miscellaneous topics. Here occur titles and characters in literature, political nicknames, popular allusions, etc. This has been found a popular convenience in the Century Dictionary, in which, for instance, "Bondman" appears as "A tragedy by Massinger (1623);" to which the New International adds: "a minor opera by Balfe (1846); a novel by Hall Caine (1890), the scene of which is laid in the Isle of Man and Iceland." If one cannot find everything here—*e. g.*, "Barnburner," the name of a political faction in New York fifty years ago—there is an eminently satisfying abundance of this small information.

The department of Biography is rich beyond all that has yet appeared in encyclopædias. Some forty members of the Brown tribe find place here, besides over a dozen who add to their patronymic the slightly distinctive *e*. Not all of these may permanently remain above the encyclopædist's horizon; but none of them is here refracted from below it. The article on John Brown of Kansas must be pronounced deficient in the judicial impartiality shown his contemporary, President Buchanan. Brown is made the exponent of the "bloodiest and most unscrupulous type of frontier ruffianism." If such superlatives are his due, what words can be found for the atrocities that maddened him? In the copious illustrations that have been referred to, biography has its share in full-page portraits of illustrious characters, two or three in a volume.

Passing from general to particular, one finds a noteworthy article on Archæology, to which seventeen pages are devoted, with three full-page illustrations of Greek and American relics, besides many smaller ones—an admirable brief of an immense and expanding subject. Rather more is desirable at its close than the mere hint of the incomputable antiquity of man, elsewhere than on the American continent. Another scientific article of great merit is that on Biology, to which five pages are devoted. Here one may think that the discussion of the rival theories of experience and of natural selection as influential in the survival of the fittest, and the verdict in favor of the latter, have failed to take due notice of the recent theory of "orthoplasy," indorsed by some eminent names, as combining and reconciling these rivals by assigning to experience transmitted by education its value in utilizing the opportunities given by natural selection.

Among articles on the mechanic arts, that on the Atlantic Telegraph, with its account of the sixteen cables working at this date, those on the Automobile, with its two full-page illustrations, and on the Bridge, with three such, besides smaller ones, are excellent specimens of a present-day account. This department is fully exhibited. Bricks, butter, the machinery for making them, and even that employed in bottling, have each its full-page illustration.

Large space is given to the department of Geography, both physical and political. The physical maps of Africa, North America, South America, and Asia deserve special mention. The eighteen pages given to Australia and related subjects illustrate the value of a work that exhibits recent political changes, as in that newly organized commonwealth. The page and a half given to Australian Literature will be to many readers the revelation of a new field of interest.

Among religious subjects the Bible receives large treatment, embodying both common and curious facts to the extent of twenty-five pages. That but one page is given to Biblical Criticism may seem, in view of the appended bibliography, to be an instance of wise judgment in a subject at once so recondite and so hotly litigated. In this bibliography both sides are impartially represented. Throughout the entire work special students will find a good bibliography attached to every important article, with references to special monographs as well as to standard works.

It is not to be expected that a work involving innumerable particulars in the entire sphere of human knowledge shall be free of all slips and errors. Some

such occur. It is hardly a historical fact that Cæsar "out of love for Cleopatra entered on the Alexandrine war." The historian Merivale represents the outbreak of hostility as prior to the love affair. Of another kind is the inaccurate statement that "the original site of Boston included Beacon, Copp's, and Fort hills, all of which have been considerably cut down." This is true of Beacon hill, not of Copp's, while of Fort hill not a vestige remains. The State House at Boston, in the fine engraving presented of its front, erected, as the text states, in 1795, is termed "The New State House." What is new in the building is a large extension in the rear, not visible in the engraving.

More serious misrepresentation occurs in the biographical sketch of Henry Ward Beecher, viz.: "His theology was not in general accord with that of the Congregational denomination. In 1878 he formally renounced belief in the eternity of future punishment." The latter statement is correct; the former is not. Mr. Beecher was not in *full* accord with the then general belief of Congregationalists: the disavowal here cited is proof of that, but it proves no more. That he was in *general* accord is incontestably true. Less excusable than this is the injustice done to Mr. Beecher by the omission of material facts, which should balance the statement that a jury failed by a vote of nine to three to acquit him of the charge of adultery, by a statement of his vindication by a remarkably large and representative church council after a searching investigation. Referring to this, the late President Porter, of Yale, in a public reply in England to insinuations against Mr. Beecher, expressed surprise that well-informed persons should regard Mr. Beecher's innocence as involved in any doubt. Yet the New International leaves it in doubt. The statements here criticised are taken over from the old International, and seem to have escaped that "searching criticism" which all matter from that source is stated to have undergone. Mr. Beecher's brothers, Charles, Edward, and Thomas, are severally termed a Congregational "divine," or "clergyman," but he is described as a "Protestant pulpit orator." The proper term for each is "Congregational minister," under which designation each appeared in the Congregational Year-Book till his death.

It remains to be said that this really formidable undertaking gives promsie of achievement not only creditable but brilliant. It aims at the production, not merely of a work for reference, but of a condensed library, in whose many departments the best knowledge of the time, digested and arranged, is presented in accessible and convenient form. The educational value of such a work for the home as well as the school is unquestionably great.

Books of the Week

This report of current literature is supplemented by fuller reviews of such books as in the judgment of the editors are of special importance to our readers. Any of these books will be sent by the publishers of The Outlook, postpaid, to any address on receipt of the published price, with postage added when the price is marked "net."

Aspects of the Jewish Question. By a Quarterly Reviewer. With Maps. E. P. Dutton & Co., New York. 5¼×6 in. 98 pages. $1, net.

Across Coveted Lands. By A. Henry Savage Landor. Illustrated. In 2 vols. Charles Scribner's Sons, New York. 5¾×9 in. $7.50.

In all externals this book is prepossessing. The two large volumes are well printed and have many good reproduced photographs. The narrative tells of the author's adventures in Persia and Beluchistan, which countries he reached through Russia and Afghanistan. As a personal record of travel the book is entertaining in a moderate degree, but when one tries to find material of real value about the countries which are indeed "coveted" by nations richer and more powerful, the result is disappointing and unsatisfactory. Neither the people nor the countries are brought out in strong relief.

Bairn Books (The): The Book of the Zoo. The Book of Shops. By Walter Copeland. Illustrated. E. P. Dutton & Co., New York. 3½×5 in. Per set, $1.25.

Black Prince and Other Poems (The). By Maurice Baring. John Lane, New York. 5×7¾ in. 144 pages.

Reserved for later notice.

Called of God (The). By A. B. Davidson, D.D., L.L.D., Litt.D. Edited by J. A. Paterson, D.D. Charles Scribner's Sons, New York. 5½×8¼ in. 336 pages. $2, net.

Under this title are included thirteen discourses by the late Professor Davidson, who for forty years held the chair of Hebr[ew] Old Testament Literature in the Free

College, Edinburgh. Dr. Davidson, a scholar of international reputation, was a man of deeply emotional nature protected by a crust of reserve. A biographical introduction portrays his character. The discourses "all deal with the history—generally with a spiritual crisis in the history—of some Scripture personality."

Characters of Theophrastus (The). A Translation, with Introduction, by Charles E. Bennett and William A. Hammond. Longmans, Green & Co., New York. 4¼×6¾ in. 85 pages. 90c., net.

Christian Science and the Gospel of Jesus Christ. By Rev. George Francis Greene, D.D. The Chronicle Print, Cranford, N. J. 4½×6½ in. 24 pages.

Vigorous; effective; a brief description of the claims of "Christian Science," and an expression of the writer's views of their fallacy.

Christ of the Ages (The): In Words of Holy Writ. By William Norman Guthrie. The Western Literary Press, Cincinnati. 6½×8½ in. 162 pages.

This is in some points a unique work. The demand of Christian thought to-day is for the historical Jesus, as he went about in Palestine, for the exact reproduction of his personality in word and deed, as it appeared to his disciples. Dr. Caird, the Master of Balliol, has shown that, however desirable be the closest possible approximation to this, it is beyond realization; the Christ, through the interpretation of him by his spirit after he had passed beyond earthly limitations, has necessarily become, and must permanently remain, an ideal conception—none the less authoritative for that, since there is no authority more imperative in conscience than that of the moral and religious ideal, when once conceived. So much is necessary to hold to, if one would fairly estimate the idea on which Mr. Guthrie's work is based. "The Christ," he says, "is He we see—not He alone whom the Gospels give." Mr. Guthrie's Christian consciousness finds the lineaments of his Jesus in the Hebrew equally with the Christian Scriptures, and has drawn on both to paint his portrait of the Son of Man in the freest exercise of the right of "Christian appropriation." Thus, the story of the temptation in the wilderness is introduced by a series of prophetic visions given in the Old Testament, which Jesus is represented as pondering during the "forty days." The portrait resulting from this treatment of the Scriptures is a mosaic, for which not all parts of the Gospels were found serviceable; so that there are some large omissions. The literary form is that of the "loose" blank verse used by the later Jacobean dramatists, and the sequence of the parts conforms to the order of the Christian year.

Collection of the Writings of John James Ingalls (A): Essays, Addresses, and Orations. Hudson-Kimberly Publishing Co., Kansas City, Mo. 6×9½ in. 536 pages.

Commodore Trunnion's Courtship and The Cruise of H. M. S. Thunder. By Tobias Smollett. Herbert B. Turner & Co., Boston. 4½×6½ in. 245 pages. $1.25.

Essence of Christianity (The): A Study in Definition. By William Adams Brown, Ph.D., D.D. Charles Scribner's Sons, New York. 5½×8¼ in. 332 pages. $1.50, net.

Reserved for later notice.

E. W. Dadson, B.A., D.D.: The Man and His Message. Edited by Jones H. Farmer, B.A., LL.D. William Briggs, Toronto. 5¼×7¾ in. 379 pages.

Dr. Dadson, who died in 1900, was a beloved pastor in Montreal and elsewhere, widely influential as a denominational leader and as editor for some years of the "Canadian Baptist." His memorial in this volume is that of a strong and much-loved man. It includes a sketch of his life, with many paragraphs from his writings on current topics, besides some characteristic sermons.

First-Hand Bits of Stable Lore. By Francis M. Ware. Illustrated. Little, Brown & Co., Boston. 5×8 in. 297 pages. $2, net.

In delightfully conversational language Mr. Ware gives us many hints concerning the proper care of horses. Every one who owns a horse should also own this volume.

Hasting the Pirate. By Paul Creswick. Illustrated. E. P. Dutton & Co., New York. 5×8 in. 303 pages. $1.25.

This romancer harks back to the age of the Vikings for his tale of love and war. Saxon and Dane struggle for supremacy of sea and land, and for possession of two fair maids who are stolen back and forth, and gently and roughly wooed by turns. When finally they are given to their rightful lovers, it is by Alfred the Great. In the earlier chapters the two heroes are Alfred's guests at Corpe Castle, where the King holds Witan, persuading his councilors to co-operate with him in building many ships that England's navy may match the Vikings. There is a fine feast at Corpe Castle, and some love-making, while the pirates busy themselves in stealing such vessels as the good King commands. But everything comes right in the end, as it was bound to do with Alfred for King. The fault of the tale is that the heroes rush so foolishly into danger—but that is the way of heroes in romance.

Haunted Mine (The). By Harry Castlemon. Illustrated. Henry T. Coates & Co., Philadelphia. 5×7½ in. 433 pages. 80c.

Her Majesty the King. By James Jeffrey Roche. Illustrated. R. H. Russell, New York. 5×8 in. 149 pages.

Her Wilful Way. By Helen Sherman Griffith. Illustrated. The Penn Publishing Co., Philadelphia. 5×7½ in. 360 pages. 90c., net.

Girls' stories are rare of late. This is one about a girl of good heart and mind, but thoughtless and irritable. A quarrel with a stepmother and the reconciliation of the two form part of the plot.

History of Christianity (The): From St. Paul to Bishop Brooks. By William Edward Gardner. Thomas Whittaker, New York. 5×7½ in. 209 pages. 50c., net.

Mr. Gardner has very fairly accomplished the difficult task of condensing into some hundred and seventy pages an account of the development of primitive into modern Christianity. It is written in a catholic spirit and serviceable in any Sunday-school. Occasionally the narrative is so condensed as to be misleading. A serious case of this is the representation of the civil war in England, 1642–1648, as growing out of a religious rather than a political controversy. It is also quite amiss to speak of Tyndale's version of the Bible as discred-

ited by its "inaccuracies." It was rather its annotations that made it distasteful to the church authorities. Tyndale's work set the standard for his successors.

History of the Middle Ages (A). By Dana Carleton Munro. Illustrated. (Twentieth Century Text-Books.) D. Appleton & Co., New York. 5×8 in. 242 pages. 90c.

A commendable attempt to simplify an intricate subject. Though compact, the book has something more than the dry bones of history; there are color and dramatic rendering of stirring episodes to be found not infrequently. The author's division and arrangement are excellent. He emphasizes three topics—the work of the Christian Church, the debt due to Byzantine and Arabic civilizations, and the life of the times.

Horace's Odes, Epodes, and Carmen Sæculare. Edited by Clifford Herschel Moore, Ph.D. The American Book Co., New York. 5×7½ in. 465 pages. $1.50.

Immortality and Other Essays. By Charles Carroll Everett. The American Unitarian Association, Boston. 5×7¾ in. 280 pages. $1.20, net.

This third volume of essays by the late Dean of the Harvard Divinity School bears the stamp of his penetrating and cultivated mind and the charm of his felicitous literary style. While the transient occasions for which he wrote and temporary phases of thought are reflected here and there in these essays, they are so pervaded by the ideas of universal reason as to have permanent value. Theologically Dr. Everett was a rationalist; religiously he was a mystic, as any one must be who is profoundly possessed by the thought of the immanence of God. To listen to the discourse of such a mind brings enlightenment and peace.

Isle of Content (The). By George F. Butler, M.D. The Erudite Press, Concord, Mass. 6¼×9¾ in. 135 pages. $1.50.

This elegantly made volume contains the reflections of an educated and thoughtful mind on a variety of themes, the first of which loans its title to the whole. Without any trace of originality, and with no special charm of literary form, they are marked by good sense and sincerity, by cheerfulness and human sympathy.

Jewish Encyclopædia (The): A Descriptive Record of the History, Religion, Literature, and Customs of the Jewish People from the Earliest Times to the Present Day. Prepared by more than Four Hundred Scholars and Specialists under the Direction of the following Editorial Board: Cyrus Adler, Ph.D.; Gotthard Deutsch, Ph.D.; Richard Gottheil, Ph.D.; Joseph Jacobs, B.A.; Marcus Jastrow, Ph.D.; Frederick de Sola Mendes, Ph.D.; Isidore Singer, Ph.D., and Others. Vol. III., Bencemero—Chazanuth. Illustrated. Funk & Wagnalls Co., New York. 7¼×11 in. 684 pages.

Nothing in our day more strongly attests the renaissance of the spirit of Judaism than this great work, Jewish in its inception and design, but supported by the co-operation of Christian with Jewish scholars. Its field is as wide as is the dispersion of the children of Israel. Every country, every town of note, where they have become a part of the community, every person of note whose history connects with theirs, comes into this record—a record of the religious, political, social, and scholarly activity of this persevering people for the past three thousand years. Thus in the present volume Lord Byron has place as the writer of "Hebrew Melodies;" the Emperor Caracalla of Rome, and the Empress Catherine II. of Russia, for their friendliness to the Jews. In whatever field Jewish activity has expressed itself, it finds a record here; *e. g.*, the British Museum has two pages for an account of the books and other objects of Jewish interest therein. The largest space is accorded to the Bible in various points of view, among which the two pages given to the Bible in Mohammedan literature illuminate a field too much neglected. Cantillation, the mode of intoning in public prayer and reading, is illustrated by some eight pages of musical notation. Among the numerous illustrations, those of the censorship to which Jewish publications have been subjected during the last two centuries are conspicuous: the first volume of this encyclopædia appears thus defaced by Russian intolerance. The bibliographical department is rich both in information and in illustration. Were it worth while to speak of slips, a singular one to notice in such a work is the etymology assigned to "catacomb," as a hybrid compound of Greek and Latin, whereas it is wholly Greek. It is matter for National satisfaction that only in America was it found possible to launch this epoch-marking work, nine more volumes of which will be required for its completion.

Literary Values and Other Papers. By John Burroughs. Houghton, Mifflin & Co., Boston. 5¾×7 in. 256 pages. $1.10, net.

Reserved for later notice.

Macaulay's Essay on Lord Clive. Introduction and Notes by J. W. Pearce, Ph.D. The Macmillan Co., New York. 4×6 in. 186 pages. 25c.

My Life-Work. By Samuel Smith, M.P. Illustrated. Hodder & Stoughton, London, England. 5½×8¾ in. 630 pages.

This volume is doubly interesting. It is of moment first as the autobiography of one who has deservedly occupied a prominent place in the eyes of all Englishmen, especially of all Dissenters; secondly, because the book comprises a capital history of Parliamentary proceedings during the past half-century. Though Mr. Samuel Smith is a veteran in politics, his matured opinions are not always those which one might expect—for instance, he thinks that India involves by far the most difficult problems confronting the British nation in the future, and adds: "Our future relations with America are almost as important as those with India." Other observers might think that the South African problems now exceed in complexity the Indian; and that the future relations of Great Britain with America are even more important than the relations existing between England and India. The most noteworthy part of the volume to the student of history and to the student of religion alike is Mr. Smith's account of his position on various questions affecting the Anglican Church and the Dissenting bodies. In 1897 he offered a motion to disestablish the Church of England, and says: "I never undertook anything that was more unpopular. All the

Liberal leaders were opposed to it, and made me feel it so in a manner that was very trying, and of course it was resented by the whole Conservative party. I was well aware that as a politician it was mere folly to raise such a question. None had touched it since Mr. Miall, in 1873, and the cause had greatly gone down in the country. The impelling motive that urged me to this course was the apparent impossibility of rousing the country to the stealthy Romanizing of the Church [of England] except by a motion of this kind." If disestablishment ever comes, the name of Samuel Smith will be remembered as a courageous protagonist, although the time was not ripe for such an extension of freedom as he and others have endeavored to bring about. The autobiography is rather too diffusely written; it might have been condensed with profit to the average reader. It will be found, however, not only a recognized source of information for the student of English politics, but also a source of inspiration to any man. It shows how religion animates not only one department of life but all departments.

Myrtle and Oak. By Rennell Rodd. Forbes & Co., Boston. 5×7¾ in. 115 pages. $1.

Orchestral Instruments and Their Use. By Arthur Elson. Illustrated. L. C. Page & Co., Boston. 5¼×8 in. 299 pages.

An introductory chapter deals with primitive and "savage" instruments, and is followed by one on the growth of the orchestra. The final chapter treats of the orchestra as a unit, and characterizes some of the most eminent orchestral conductors. The intermediate chapters describe the individual instruments: first the violin, and then, in order, the other stringed instruments, the reeds, the brass, and the instruments of percussion. The book is enlivened with a large number of pertinent stories about music and musicians. The author has not only a capital sense of humor, but also a very good wit of his own. He has succeeded admirably in making a necessarily brief and terse treatment of his theme very readable and clear. The volume is well worth adding to a musical library, and deserves a welcome from the amateur and the concert-goer. There is a useful index.

Prayers and Thoughts for the Use of the Sick. Selected by Lucy Forney Bittinger. The J. B. Lippincott Co., Philadelphia. 4½×7¼ in. 161 pages. $1, net.

This collection, which includes many passages of Scripture, is both judicious and serviceable for consolation and patience, not only to the sick, but also to those in various kinds of trouble.

Preacher's Life (A): An Autobiography and an Album. By Joseph Parker, D.D. Illustrated. T. Y. Crowell & Co., New York. 5½×8½ in. 426 pages.

The recent death of Dr. Parker, the many-sided Christian preacher, draws fresh attention to his autobiography, penned barely five years since. Whatever other memorial of him may appear in print, this will be its natural companion. Here is the real Parker to be compared with Parker as others saw him. The autobiography itself is divided into "Personal and Pastoral," "Literary and Controversial." The appended "Album" is a series of personal sketches—Gladstone, Beecher, and others. A royal personality pervades the whole.

Selected Poems. By William Watson. John Lane, New York. 4½×7 in. 143 pages.

Reserved for later notice.

Short Tales from Storyland. By Evelyn Everett-Green. Illustrated in Color and Black and White. E. P. Dutton & Co., New York. 7×9½ in. 96 pages. $1.50.

Ten Girls from Dickens. By Kate Dickinson Sweetser. Illustrated by George Alfred Williams. J. F. Taylor & Co., New York. 6½×9½ in. 236 pages.

Triumph of Love (The). By Edmond Holmes. John Lane, New York. 6½×8 in. 68 pages.

Reserved for later notice.

True History of the American Revolution (The). By Sydney George Fisher. Illustrations. J. B. Lippincott Co., Philadelphia. 5×8 in. 437 pages. $2, net.

Though falling short of a great work, the narrative of this volume sustains its daring title. Passionately patriotic, in fullest sympathy with the revolutionary elements which carried on our great struggle for national independence, the author puts in the clearest light the excesses committed on our side, the divisions in the ranks of our own citizens, who the loyalists were and why they sided with Great Britain, the moderation shown by the British commander Howe, and innumerable other things which are practically unknown by the great body of cultivated Americans—unless they have read Lecky or Tyler—and yet must be known if a true or even plausible picture of the Revolution is to be presented. It is a commonplace to say that history is past politics, but the very historians who repeat it write of our Revolution as if in that political struggle society divided in a different way from that in which it divides to-day, and as if all the arguments were on one side, while to-day there is so much to be said on both. As Mr. Fisher pertinently remarks:

> The people who write histories are usually of the class who take the side of the Government in revolution, and as Americans they are anxious to believe that our Revolution was different from others, more decorous, and altogether free from the atrocities, mistakes, and absurdities which characterized even the patriot party in the Revolution. They do not like to describe in their full coloring the strong Americanism and the doctrines of the rights of man which inspired the party that put through our successful rebellion. They have, accordingly, tried to describe a revolution in which all scholarly, refined, and conservative persons might have unhesitatingly taken part, but such revolutions have never been known to happen.

Mr. Fisher writes of a revolution in which the radical elements had the same characteristics they have to-day, and the story rings true. Fortunately, the narrative is as interesting as it is instructive, and therefore, while we do not take Mr. Fisher's view upon all points, we heartily commend his volume to all who would like to understand why the "scholarly, refined, and conservative" elements in our own country, as well as in England, were generally antagonistic to American independence.

Correspondence

Our Plutocratic Government

To the Editors of The Outlook:

The article in The Outlook of November 22, on "The Trust Problem," is gratifying to me, but at the same time makes assertions which the facts in the case would seem to refute.

For example, on page 671, you assert that this government is "democratic in politics, education, and religion;" and that "the plain people control the government of city, State, and Nation." Now I say that these statements may be true some day, that they ought to be true to-day, but that they are not true now, nor have they ever been true in this country, especially since the adoption of our present Constitution in 1787. The preamble to that Constitution is as much out of harmony with the Constitution itself as is the Constitution out of harmony with the principles of liberty and equality laid down in the Declaration of Independence eleven years before. One is wholly inconsistent with the other. To say that our present government is democratic, or even republican, in principle is to say what is not true. To say that it is aristocratic is not to come as near to the truth as to say that it is plutocratic. Our Constitution was written primarily for the defense of private property, and hence, of necessity, the powers of government were placed in the hands of private property (capital) by those who made the Constitution. This act on the part of the framers of the Constitution was done deliberately, as their own statements will show; hence they cannot be excused, nor can they be held to be innocent of the conscious betrayal of the rights of the people.

That our government is not a popular government in any true sense can be shown, first, by the expressed purpose of the prominent framers of our Constitution, and, second, by the working of the instrument itself.

First, as to the purpose of the framers; and I can take the time to refer to the ideas of but a few of the men in the Philadelphia Convention. Many other statements, with these which I ask your permission to give, may be found printed in Mr. Madison's Minutes of the Federal Convention, comprising Volume V. of Elliott's Debates, and Mr. Yates's Minutes, in Vol. I. of the same work:

"Mr. Madison: Government ought to be so constituted as to protect the minority of the opulent against the majority."—E. D., I. 449.

"Mr. Gouverneur Morris: The Senate ought to be composed of men of great and established property—aristocracy; . . . and to make them completely independent, they should be chosen for life. Such an aristocratic body will keep down the turbulence of democracy."—E. D., I. 475.

"Mr. Madison: In all civilized countries the people fall into different classes, having a real or supposed difference of interest. There will be particularly the distinction of rich and poor. In framing a system of government which we wish to last for ages, we should not lose sight of the changes which ages will produce. An increase of population will of necessity increase the proportion of those who will labor under all the hardships of life, and secretly sigh for a more equal distribution of its blessings. These may in time outnumber those who are placed above the feelings of indigence. According to the equal laws of suffrage, the power will slide into the hands of the poor. How is this danger to be guarded against?"—E. D., V. 243.

"Mr. Hamilton stated that he did not believe in a republican government, but urged those who did to tone their government as high as possible. Inequality constituted the great and fundamental distinction in society."—E. D., V. 244.

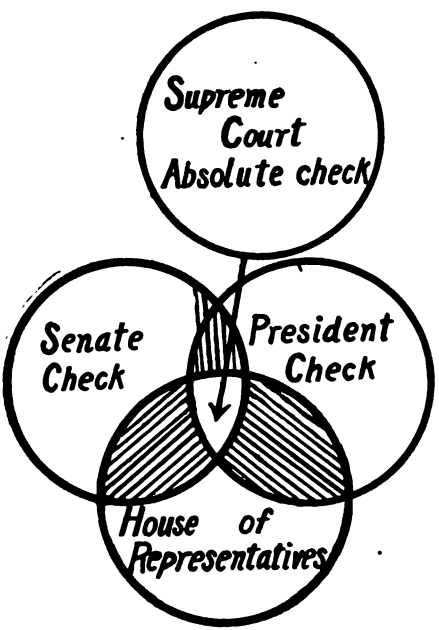
"Mr. Butler insisted that the labor of a slave in South Carolina was as productive and valuable as that of a freeman in Massachusetts; that as wealth was the great means of defense and utility to the nation, they were equally valuable to it with freemen; and that, consequently, an equal representation ought to be allowed for them in a government which was instituted principally for the protection of property."—V. 296.

"Mr. Hamilton: All communities divide themselves into the few and the many. The first are the rich and well born; the other, the mass of the people. . . . The people are turbulent and changing; they seldom judge or determine right. Give, therefore, to the rich and well born a distinct, permanent place in the government. They will check the unsteadiness of the mass of the people."—E. D., I. 421.

"Mr. Gerry: Government should be moved as far as possible from the people."—V. 136.

"In Massachusetts there are two parties: one devoted to democracy—the worst of all political evils; the other as violent in the opposite extreme."—V. 537.

"Mr. Randolph: The general object of the Senate was to provide a cure for the turbulence and follies of democracy."—V. 138.



There are several other extracts I

would like to give, but must limit myself to these, with one other from Mr. Madison:

"In a republican government the majority, if united, have always an opportunity. The only remedy is to enlarge the sphere, and thereby divide the community into so great a number of interests and parties that a majority will not be likely to have a common interest separate from that of the whole, or of a minority; and, in the second place, that in case they should have such an interest, they may not be so apt to unite in the pursuit of it."—V. 163.

When it is remembered that the attempt was made by the Convention to have these records destroyed, and that they were not given to the people till more than fifty years after the adoption of the Constitution, and that the Constitution was made so rigid that it is practically impossible even to amend it, is there not manifest in these facts, as well as in the statements made in the Convention, that the framers knew that they were robbing the people of the United States of their rights and liberties?

Now, in the second place, let us see how the Constitution has worked practically. To show this I append a diagram

which is almost self-explanatory. The House of Representatives is the only popular branch of the government. This branch has a negative check, but practically no power positively to carry out the will of the people. The Senate and the Executive veto are each checks upon and nothing can pass the House u which these other powers do not ag But, strangest of all innovations in establishment of a government, sho these three branches finally agree u any new measure in the interest of people, and it become a law, the Supre Court, with a rigid Constitution back it, stands ready to kill the measure w an absolute veto. This feature of government, which Mr. John Fiske highly commended as a purely "Americ idea," is good if the people want a cons tutional monarchy, but such an absol negative power placed in the hands o few men, naturally aristocratic in tend cies, or with any tendencies, howev good they may be, in itself refutes t statement so often made by the press a by political speakers in this country, th this government is founded upon dem cratic principles.

THOMAS C. WISWELL.

University Congregational Church,
Seattle, Washington.

[It is impossible for us to refute th statements of our correspondent, becaus he is discussing—it appears to us—n matters of fact, but matters of opinion. the people and government of the Unite States are in the state which he believe them to be in, the condition of all co cerned—plutocrats, proletariat, editor clergymen, everybody indeed exceptin the members of the Supreme Court an the United States Senators (although th popular election of Senators which w foresee in the not far distant future i going to knock *them* out, too) is sorry i deed. In our turn we should like to as our correspondent what he proposes to d about it. Has he or any other one ind vidual, or set of individuals, invented system of government to take the place o our present system? If so, we should b glad to know about it. Our conviction amply confirmed and sustained by history is that governments are the fruits of evo lution, not of invention. The farmer o the State of Washington who wants t improve his apple crop does it, not wit the saw, with the ax, and with fire, bu by grafting, plowing, pruning, and spray ing. This is the method to be followed, we believe, in developing a true democ racy.—THE EDITORS.]

NEW YORK LIFE
Insurance Company

JANUARY 1, 1903

Total Admitted Assets, as per Certificate of Insurance Department		**$322,840,900**
Reserve Value of Policies and Annuities Policies known as the Company's 3% policies and all policies issued since Dec. 31, 1900, being valued as per American Experience Table of Mortality with 3% interest; other Policies valued as per Combined Experience Table of Mortality with 4% interest, as per Certificate of New York Insurance Department		$268,344,420
General Liabilities		$4,462,361
Additional Reserve on Policies which the Company values on a 3% or 3½% basis, over the 4% valuation by the Insurance Department	$5,397,325	
Reserve to Provide Dividends payable to policy-holders during 1903 and in subsequent years as per policy contracts	34,125,079	
Reserves to provide for all other Contingencies	10,511,715	
		50,034,119
Total		**$322,840,900**
Income, 1902		$79,108,401
New Insurance paid for in 1902		302,798,229
Insurance in force (Paid-for)		1,553,628,026

The NEW YORK LIFE'S Accumulation Policy contains no restrictions whatever, and only one condition, namely, the payment of premiums. It is incontestable by its terms, and is automatically non-forfeitable after the first premium is paid. After the policy has been in force two full years, loans will be made thereon by the Company at 5 per cent. interest, premium for the current year being paid.

JOHN A. McCALL, President.
HENRY TUCK, Vice-President.

THE OUTLOOK COMPANY

287 Fourth Avenue, New York

the beginning of December, that the Republican Congress had ignored this recommendation during the intervening weeks of coal famine, and that the time had come for this recommendation to be embodied in legislation. Senator Aldrich, the Republican leader in tariff matters, at first objected to the consideration of this resolution on the strong Constitutional ground that all bills for raising revenue must originate in the House, but immediately weakened his position by declaring that the Democrats talked about free coal when out of power, but when in power had, with the exception of Senator Hill, of New York, voted unanimously for a duty of forty cents a ton. Senator Vest answered this thrust most effectively by telling the whole truth, though it cut sharply the faction of his own party which favors levying taxes to promote private revenues. It was a well-known fact, he declared, that the Senate amendment restoring a duty on coal when the House Democrats had made it free was dictated by a handful of Democratic Senators who "held up" the party by threatening to act with the Republicans unless the coal interests continued to be protected. As the debate continued, Senator Vest again drew fire by declaring that Mr. Dingley had placed the duties in the present tariff higher than he thought they ought to remain, for the express purpose of furnishing a margin to be traded away for commercial concessions from other conntries. Senators Aldrich and Hale resented the statement that such strategy had been employed by Mr. Dingley, even declaring that it was a reflection upon his honor, when Senator Dolliver, who had been Mr. Dingley's associate on the Committee on Ways and Means, created confusion in the ranks of his ultra-protectionist colleagues by declaring that Mr. Dingley "did put the duties up for the express purpose of having them traded down," and defended the policy as not only in line with the precedents set by the parliaments of Europe, but in line with all the Republican platform declarations in favor of reciprocity. As the debate proceeded it became evident to the protectionist leaders that their party would not defend a tariff on coal when it already commanded famine prices, and when the House Committee met to frame a bill the Republican members soon agreed to make anthracite coal permanently free of duty, and to grant for one year a rebate of the full tax collected on importations of bituminous coal. The bill embodying this proposal passed the House with less than half a dozen adverse votes, and was accepted by the Senate and signed by the President as soon as the bill came before them. The rebate feature of the bill is a concession to the ultra-protectionists, but in its operation will be simply a useless and annoying piece of red tape.

❀

Proposed Seizure of Mines and Railroads

But the putting of coal on the free list did not express the radicalism which the present famine has developed among people hitherto classed as conservative. On the day the duties were suspended Chairman Jenkins, of the Judiciary Committee of the House, introduced a resolution in line with ex-Senator Hill's "revolutionary" plank in the New York Democratic platform last fall, and recommending a far larger measure of public ownership than Senator Hill *if* Congress has the Constitutional power to order it, and the necessity for its exercise has arisen. The resolution read as follows:

Resolved, That the Committee on Judiciary be and is hereby directed to investigate and report to this House with all convenient speed the opinion of that Committee as to the power of Congress to declare that a necessity has arisen for taking possession of all coal, coal-beds, and coal-mines in the United States, and all lines of transportation, agencies, instruments, and vehicles of commerce necessary for the transportation of coal, and that if in the opinion of that Committee the power exists and a necessity for the exercise of such power has arisen, that that Committee forthwith report to this House a bill declaring the necessity, providing fully and in detail the occasions, modes, conditions, and agencies for said appropriation that will fully and completely exhibit the power of Congress in that regard.

❀

Is This Constitutional?

Such a proposition coming from the Chairman of the Judiciary Committee deserves an attention which would not be accorded to it if presented by an unknown newspaper correspondent, by an irresponsible newspaper editorial thrown out to catch passing attention, or by an individual politician who might be suspected of

offering it as a bid for popular favor. It indicates, not merely how deep and widespread is the dissatisfaction with the conditions into which private and uncontrolled ownership and management of the coal mines and coal roads have brought the country, but also how far that dissatisfaction has carried leaders of public opinion in a Socialistic direction. The coal operators have done more to give Socialism a standing in the United States than all the apostles of Socialism since the word was first coined. The Outlook expresses with reserve its judgment on the Constitutional aspect of this proposition. It appears to us, however, entirely reasonable to believe that the Supreme Court would uphold the power of Congress under the Constitution to take over any railroads of an inter-State character and operate them for the public benefit, provided, of course, provision was made for paying the present owners a fair market price for them. The Constitution gives Congress absolute control of all inter-State commerce. It puts no explicit limits upon that control. It implies no other limits than such as are necessarily implied in other provisions of the Constitution, such as that private property cannot be taken for public use without compensation. Control of inter-State commerce involves control of all the instruments of inter-State commerce; that is, Congress has practically unlimited power—except as above indicated—over all the instruments of inter-State commerce, including inter-State railroads. The decisions of the Supreme Court sanction, we think, this general statement. If, in the opinion of Congress, that control can be exercised only by seizing and operating the instruments of inter-State commerce, it would have the Constitutional right to seize and operate them, either temporarily or permanently, provided that in doing so it gave a reasonable compensation to the present owners. It has the same right to carry fuel that it has to carry letters; and whether a public necessity has arisen for the exercise of this right is a question for Congress, not for the Court, to decide. But the right to seize and operate the coal-mines is by no means equally clear. We are not able to see how that right under our Constitution can be defended. The United States is a Nation, but it is a Nation formed by the union of sovereign States. Their sovereignty is limited and defined; but the sovereignty of the Federal Government is also limited and defined. By the Constitution the powers not conferred upon the Federal Government either by express terms or by necessary implication are reserved to the States. A clause in the Constitution expressly confers on the Federal Government the power to regulate inter-State commerce, but we do not know of any clause in the Constitution which in express terms or by necessary implication confers upon that Government the authority to enter a State and take the property of private owners and use it, not for governmental purposes, but for the general benefit of the public at large. Nor do we see how the claim by the Federal Government of such power can be reconciled with decisions of the Supreme Court which have drawn a clear line of distinction between inter-State commerce and the products of industry which are the subjects of that commerce. Mr. Jenkins's resolutions are both interesting and significant, because they indicate a public spirit which it will be wise for coal operators and coal roads not to set at defiance; but we do not believe that the people will attempt so radical a remedy for present ills until they have experimented with other measures less drastic and revolutionary in their character.

❁

Mormon Apostle Named for United States Senate

At the Republican caucus of the Utah Legislature held last week to nominate a United States Senator to succeed Mr. Rawlins, Apostle Reed Smoot received more than three-quarters of the votes on the first ballot, and his nomination was immediately made unanimous. As the Utah Legislature is this year Republican by the overwhelming majority of 51 to 11, Mr. Smoot's nomination is of course equivalent to an election. Week before last it was announced that President Roosevelt had communicated to Mr. Smoot the request that he withdraw his candidacy, but this communication, if made, produced no effect either upon Mr. Smoot or his Mormon supporters, who were moved

because what he has done has been in his characteristically frank and direct manner. When Booker Washington dined at the White House, it did not occur to the President that it concerned or would interest any one outside of his own private circle. His appointment of Dr. Crum to the office of Collector of the Port of Charleston, South Carolina, was made because no negro Federal office-holder had been selected under his administration for that State, and because it had been intimated to the Administration that while Charleston would vigorously protest against a negro postmaster, it would acquiesce in the appointment of a negro to such an office as that of Collector of the Port. The President recognizes the very widespread and deeply felt reluctance among Southern whites to having a negro in a public office where he comes in contact with the wives and daughters of the white residents; but he felt that this objection did not affect the Port Collectorship. The President having made the appointment of Dr. Crum on political and civic grounds that are entirely tenable in the South as well as in the North, and under the impression that he was acting with ample consideration of the feelings of Charlestonians, we do not see how he can withdraw the appointment either with justice to his appointee or with regard for his own self-respect. The South Carolina Senate has, however, passed a resolution of protest to be forwarded to the United States Senate, and it is possible—although we think hardly probable—that the appointment may not be confirmed. A Federal negro appointment has been made in Boston. William H. Lewis, a graduate of Amherst College and of the Harvard Law School, has been appointed United States Assistant District Attorney. The appointment was made by the District Attorney, but with the undoubted approval of the President. Mr. Lewis is not only a capable lawyer, but during his college and university courses was a very popular and successful athlete—famous all over the country as one of the best football players that Harvard University has ever had. In his college life no distinctions were made on account of his color. We believe it is a perfectly sound contention that if the South is to have negro Federal officers the North should have them too.

The Indianola Case While the desirability of having a negro Collector of the Port in Charleston may be honestly questioned by those who have the welfare of both whites and blacks in the South at heart, we do not think that any fair-minded and really patriotic citizen can give anything but cordial assent to the Administration's attitude on the Indianola case. Mrs. Cox, an educated and respectable negro woman, has been postmistress at Indianola, Mississippi, for about ten years. She was appointed by President Harrison and reappointed by President McKinley. Some of the most influential and highly respectable white citizens of the town are on her bond. There has been no question raised for ten years on the part of anybody in the town concerning the satisfactory character of her administration of the post-office. During the Harrison and McKinley Administrations the white Democrats of Mississippi, believing in the doctrine that the spoils belong to the victor, accepted the fact that Republican Administrations would appoint Republican postmasters. There was no white Republican in Indianola. President Roosevelt, however, in pursuance of what we believe to be his very wise and non-partisan policy, began to name white Democrats for certain offices in the South. This led some of the white Democrats of Indianola to see a chance of getting the post-office for themselves. The attack on Mrs. Cox, therefore, had its origin in a political cabal. Indeed, when pressure was brought to bear to compel her to resign her office, a public meeting was held in the town, and forty of the best citizens voted for her retention, against thirty-seven votes for her expulsion. All the testimony of the most intelligent and fair-minded residents confirms the belief that Mrs. Cox has been an efficient and creditable Federal official, and, in our opinion, the Government is bound to protect its officers in the faithful performance of their duties with all the power and authority at its command. The Post-Office Department has taken the very proper stand that when the local authorities of Indianola shall assure the postmistress of proper protection, the office, which has been closed, will be reopened. This makes the question a very simple one; the citizens

simply have to determine whether they want a post-office in their community enough to see that it is respected. It has been said that the Post-Office Department has deprived the citizens of Indianola of the facilities of the United States mail. To us it appears that the citizens are simply depriving themselves of these benefits.

❀

"Cornered" Contracts Not Binding

The Appellate Court in Chicago has handed down a sweeping decision declaring that, under the laws of Illinois, dealers who have sold for future delivery goods they do not own cannot be forced to settle their trades on the basis of an artificial value created by the "cornering" of the market. In the case that called forth this decision a Chicago firm had sold oats for delivery last July. When the time for the delivery arrived, the price of oats, as the firm claimed, was forced to a fictitious figure by the action of eight Board of Trade members, who had bought up more oats than could possibly be brought to Chicago before the end of the month. The firm asked and obtained an injunction from a lower court which kept the creators of the corner from collecting the extortionate prices established through their own conspiracy, and the Appellate Court has now sustained this injunction. The decision leaves the Board of Trade free to discipline its members who do not fulfill their contracts in accordance with its rules, and without doubt the manipulation of corners will go on, but those who manipulate them will be less confident of profiting by their wrongs, as the victimized dealers can always appeal to the courts for release from their contracts. The law and the decision making the cornered contracts invalid are thoroughly good as far as they go, but they go little further than the law and decision making gambling contracts invalid. The cornering of markets through the speculative purchase of more goods than can be brought to them can be checked completely only by legislation prohibiting sales for future delivery save by those who own or produce the goods in question. To get rid of corners and the sudden riches, sudden ruin, and demoralizing excitement which attend them, we must get rid of the speculative buying and selling of goods which neither buyer nor seller ever expects to use in productive business.

❀

The Chinese Indemnity

All the foreign Ministers in Peking, except Mr. Conger, the United States representative, have now signed a formal note informing the Chinese Government that failure to fulfill its obligations by refusing to pay the war indemnity of 450,000,000 taels as a "gold debt," provided for by the peace protocol, would entail grave consequences. The Chinese tael, the basis of the calculation of indebtedness, was worth nearly 75 cents when the protocol was signed; it is now worth slightly more than 60 cents. The day before this practical ultimatum was delivered, the report was published of the revenue derived from the maritime customs of the treaty ports of China for the year 1902. Though the revenue is almost a fifth greater than that for 1901 (the year of unwonted depression due to the Boxer troubles), the report for 1902 does not show the increase legitimately expected. There are gloomy prospects for the import trade, owing to the continued *likin* (internal transit) exactions, but more especially to the decline in the purchasing power of silver, a decline evident not only in China, but in our own Asiatic insular possessions, where the fluctuations in the ratio between the Philippine silver coin and the gold dollar of the United States amounted in some cases to as much as thirty per cent. during 1902. This has resulted in great injury to the business interests of the islands, besides involving a loss to the insular treasury of about $1,000,000 in gold. It is thought by many representatives of the protesting countries in the matter of the Chinese indemnity that, for the future, some plan must be devised by which, both for their sakes and for the sake of the Chinese themselves, a more permanent relation between the currency in which Chinese payments are made and the current coin of civilized nations may be established. The motive of our own Government in dealing with China is different from that of the other co-signatories of the protocol. The constant aim of Secretary Hay has been to rehabilitate, not to spoliate, China; to maintain, not to destroy, commercial

and territorial integrity; and he has constantly endeavored to impress upon the Foreign Ministers of other countries that such a course is also for them the wisest and best. If the Powers insist upon the strict letter of the protocol, they are undoubtedly justified in insisting upon payment at the rate prevailing at the time (September 7, 1901) when the protocol was signed; on the other hand, the tolerant attitude of this country in accepting, though with reserve, the payment made last July at the existing rate of exchange is not only the astutely liberal course, but the one which, in the long run, will tend to the greatest good of the greatest number. If the other Powers cannot see it in this light, they may remember that China, as well as her creditors, was represented at the Hague Conference. Under the resultant treaty China might be well within her right in attempting to have her apparently bankrupt condition, in view of the hard terms of the protocol, form the plea for a revision.

❁

The Irish Land Question

Last week Captain Shawe-Taylor, Secretary of the Committee which has prepared a new Irish land bill to be presented to Parliament next March, arrived in this country, and declares that, if the Committee's admirable plan results in the expected legislation, the Irish constabulary force will be reduced one-half, and the Land Commission abolished. Captain Shawe-Taylor adds: "We have spent two hundred million pounds to get South Africa, and I think the English Government ought to give a few millions to get peaceful Irela .d." A good many millions will be required to enable the Government, under the proposed plan, to lend the purchase money at low interest to tenants, small and large, who may thus acquire by easy payments the lands upon which they are now living. It is reported that tenants all over Ireland are now optimistic as to the future and are confidently looking forward to obtaining land holdings on the exact terms laid down in the Committee's report. This is in accord with the quick and mercurial Irish nature, as opposed to the slower-moving Anglo-Saxon. Even if the British Treasury experts should agree to all of the Committee's recommendations, Irish tenant would be well advised not to expect th immediate redemption of their islanc although a new land law, on the line proposed, would be, of course, a chie means of redemption. American compe tition is affecting them, as it is man another European people. Irishmen mus meet it, but, even if there were no Ameri can competition, they must now, in an case, augment their incomes to meet th enhanced demands of taxation. Hence not only must agriculture itself be mad more remunerative in Ireland, but old industries must be revived; above all the Irish must do what has been suc cessfully done in more than one American State where somewhat similar agricultural conditions have prevailed: crops must be diversified in order to use the land to the best advantage under new and complicated competition.

❁

The Swedish Famine

Letters and despatches from Sweden last week confirm the first intelligence of the famine in the northern part of that country. The agricultural conditions there are analogous to those in Finland, where a similar famine exists. Nearly half a million persons are affected by the Finnish famine, but the Swedish famine has thus far affected only about a quarter of that number. But the smaller number will doubtless receive the quicker relief, not only from the immediate and generous gifts from the King and other members of the royal family and from many citizens, but also from the action of the Swedes in this country. With admirable promptness they have responded to the appeals of the principal papers published here, the New York "Nordstjernan" and the Chicago "Svenska Tribun," which have already sent approximately twenty-five thousand dollars from the Swedes in this country to help their brothers in distress. The starving Swedes are eating pine bark, which is dried, ground to powder, mixed with stewed Iceland moss, and made into a kind of famine bread. The failure of the crops, owing to drought and flood, has been followed by an unaccountable scarcity of fish in the Gulf of Bothnia, and now the ptarmigan, usually found in great numbers in the stricken

district, have almost completely disappeared. Although a quarter of a million dollars have thus far been contributed in Sweden, the United States, and other countries, it is estimated that the expenditure of twenty times as much will be necessary to save the population from decimation.

Missionaries in Morocco

Events in Morocco last week were of peculiar interest to Americans and Englishmen, since they involved the hasty departure of American and English missionaries from Mequinez, thirty-four miles from Fez, the capital, and also from Fez itself. For days prior to their departure, our women especially were openly cursed, the Moors shouting, "What's this filth in our streets?" When the Americans from Mequinez arrived at Fez, the Moors exclaimed, so it is reported, "O God! we thought they were sending the cursed dogs from us, but they are coming back." It is not so many weeks since Mr. Cooper, an English missionary, was murdered at the capital itself, and this event, together with the open hostility of the natives, has caused apprehension as to the safety of the missionaries. The recrudescence of anti-foreign feeling in Morocco resembles that in China preceding the Boxer Rebellion in 1900, and is the cause of the Pretender's strength. Insurrectionary fighting is in progress all the way between Fez in the mountains and Tangier on the coast. France, always sensitive as to any possible opportunity for interference which may lead to more of a foothold in Morocco, has warned the Moorish Government that a repetition of the fighting in the vicinity of a city with such a large European population as that of Tangier would justify European intervention; this follows warnings from the same interested quarter concerning frontier complications. The continuance of the insurrection will probably benefit no one but France. Great Britain would naturally prefer to see the Sultan emerge successfully from the conflict in which he is engaged, as any disturbance of the *status quo* would involve the British Government—still busily engaged elsewhere—in new complications. Precisely these complications, however, would be welcomed by the French Government, which would take advantage of them at least to adjust its somewhat shadowy—not to say shady—frontier claims against Morocco.

❀

Dr. Delitzsch and the Kaiser

Last year, as the readers of The Outlook know, Dr. Friedrich Delitzsch, Professor of Assyriology of the University of Berlin, and son of the famous Hebrew scholar and conservative theologian Franz Delitzsch, late Professor at Leipzig, at the request of the German Emperor delivered before the Imperial Court a lecture on the Babylonian origin of the religious conceptions found in the Old Testament. This lecture has since been published in an English translation under the title of "Babel and Bible." The views there expressed, though quite in line with the development of Biblical scholarship in the German universities, are by no means in harmony with the theological conceptions which obtain in the State Church; for the conservative element in the German churches seems even more decided than the radical element in the universities. The fact, therefore, that the German Emperor is the head of the State Church gave to his invitation to Dr. Delitzsch a significance it otherwise would not have had. Again this year the Emperor, having defrayed the expenses of further research on the territory of ancient Babylonia, with the officials of the Court listened to Dr. Delitzsch in another lecture on the same subject. It was therefore not a mere impulse which actuated the Kaiser, but a well-considered and evidently sincere interest in advancing Biblical knowledge and in honoring high scholarship. Beyond this no inferences can be drawn concerning the attitude of the State Church toward the views expressed by Dr. Delitzsch. Indeed, the principal value of Dr. Delitzsch's lectures will not be in the views expressed, from which many scholars will dissent on other than dogmatic ground, but in the contributions which they make to the knowledge of historical conditions antedating earliest Hebrew literature.

❀

Church Statistics for the Year

Some very interesting facts are brought out by the annual statistical exhibit of the churches of the United States which has recently been compiled by

Henry K. Carroll, LL.D. He finds that during 1902 there was a net gain of 720 ministers, 1,261 churches, and 403,743 communicants in all the denominations in this country; which is a considerable decrease over the year before, when the increase in the number of communicants was reported as 924,675. Dr. Carroll accounts for this disparity by the fact that in 1901 the Catholic bodies were credited with an increase of 473,083, while this year the increase is placed at 120,634. The increases for the various larger denominations, as far as communicants are concerned, are:

Catholics (8 bodies)	120,634
Methodists (17 bodies)	98,184
Lutherans (22 bodies)	49,320
Baptists (13 bodies)	48,654
Presbyterians (12 bodies)	30,001
Disciples of Christ	27,836
Protestant Episcopal (2 bodies)	16,355
Congregationalists	13,330
United Brethren (2 bodies)	10,345
Adventists (6 bodies)	9,782
Reformed (3 bodies)	8,498
German Evangelical Synod	5,875
Evangelical (4 bodies)	4,311

Several of the denominations show decreases in number of ministers, churches, and communicants. The Dunkards appear to have lost 9,000 members; the German Evangelical Protestants are credited with 16,500 less than last year; the Latter-Day Saints with a decrease of 400 ministers, 86 churches, and 3,324 communicants; while the United Brethren, with a decrease of 158 ministers and 172 churches, appear to have made a gain of 10,345 communicants. Dr. Carroll notes that a new Lutheran Synod, the Slovakian, has been organized in this country during the year. It is composed of Finns, whose emigration to the United States has been greatly accelerated by the Russification of Finland.

❀

Changes in Twelve Years

Since 1890 the relative standing of the various larger denominations has been greatly changed. The Roman Catholic still remains by far the largest communion, with 9,401,798 communicants, as against 6,231,417 in 1890. The Methodist Episcopal stands second, with 2,801,798. The Latter-Day Saints have shown in twelve years the greatest gain in standing, having moved from the twenty-first to the sixteenth position. Other bodies showing a gain in relative standing are: The Regular Baptist, South (from fourth to third); the Disciples (from eighth to sixth); the African Methodist Episcopal (from eleventh to tenth); the Colored Methodist Episcopal (from twenty-third to twenty-first); the United Norwegian Lutheran (from twenty-fifth to twenty-fourth). A loss in relative standing, on the other hand, is recorded of the following bodies: Regular Baptist, Colored (from third to fourth); Regular Baptist, North (from sixth to eighth); Congregational (from tenth to eleventh); Reformed, German (from fifteenth to sixteenth); United Brethren (from sixteenth to seventeenth); Lutheran General Synod (from seventeenth to nineteenth); Methodist Protestant (from twenty-second to twenty-third); Primitive Baptist (from twenty-fourth to twenty-fifth). All of these bodies, however, show an actual increase in membership, some of them by very large percentage. The increase of the Regular Baptist, North, for instance, is over twenty-six and one-half per cent.; yet, because of the still larger relative gains of the Disciples and the Presbyterian, North, it has dropped back two places in relative standing. The bodies that retain the standing they had in 1890 are as follows: 1—Roman Catholic; 2—Methodist Episcopal; 5—Methodist Episcopal, South; 7—Presbyterian, North; 9—Protestant Episcopal; 12—Lutheran Synodical Conference; 13—African Methodist Episcopal, Zion; 14—Lutheran General Council; 18—Presbyterian, South; 20—German Evangelical Synod; 26—United Presbyterian; 27—Reformed, Dutch.

❀

Chinese Students in America

Readers of The Outlook who were stirred by Miss Miner's article in the number for December 27, on the inhospitality of America suffered by two Chinese students, Kung-Hsiang-Hsi and Fei-Chi-Ho, will be glad to hear the report that they have succeeded in their attempt, which has lasted for a year and a half, and have at last been admitted to the United States at the port of Buffalo. They are now at Oberlin College. Their admission after the presentation of passports free from technical defects does not, however, change

the vicious principle which caused their detention, with all its concomitant wretchedness. That these two students are now in position to pursue their studies is no reason whatever for relaxing the effort to change the law that now gives justification to the reproach expressed in the title of Miss Miner's article, "American Barbarism and Chinese Hospitality." We therefore repeat what we said editorially in the issue for January 3. There is reason for questioning the advisability of admitting to this country Chinese laborers who come here only for their own benefit, with the possible resulting detriment to the citizens of the Republic, but there is no vestige of reason in the law that allows, on mere technical grounds, the practical imprisonment of students whose purpose in coming to America is to fit themselves to be leaders in China's progress. The United States cannot hope to have China's good will without doing all that is possible to make easy a cordial understanding between the two countries.

❀

Adulteration of Drugs

The Health Department of the City of New York has discovered that there is widespread adulteration of phenacetin. The discovery was the result of an examination of samples purchased in the regular way over the counters of drug-stores. To most people phenacetin is well known and commonly used. It may usually be bought without a physician's prescription. The adulterants found were sugar, starch, acetanilid, antipyrin, and quinine sulphate, in differing quantities. None of these are positively harmful; though the cheaper acetanilid and antipyrin are more active heart depressants than phenacetin, they are not so much so as to prevent their common use by careful physicians. Nevertheless, the fact that the purchaser of drugs cannot know whether he obtains what he asks for is itself a menace to health. The responsibility for the adulteration has not yet been fixed. It is not certain whether it should be placed upon the German manufacturer, the American agent, or the retailer. This very uncertainty, though it should lead to suspension of judgment in placing the blame, at the same time suggests that this conscienceless business may extend to many other places besides New York. There can be conceivably nothing more contemptible than such bartering of human safety for money, especially when human safety is absolutely dependent upon the good faith of those who have it in their keeping. Those who have thus violated their trust should, when they are discovered and convicted, be made to feel the full power of the law. In the meantime this occurrence emphatically calls public attention to the great value of a well-administered health department.

❀

American Training for Philippine Priests

Last week the Rev. A. P. Doyle, of the Paulist Fathers of New York City, began the task of raising a quarter of a million dollars for the building of an Apostolic Mission House in Washington. The building is to stand on a portion of land already given for this purpose by the American Catholic University. The aim of the founders is to train missionaries and to prepare priests for the American insular possessions. The undertaking is likely to play a very important part especially in Philippine ecclesiastical questions, as it is proposed not only to train Americans to work in the islands, but also to bring theological students and priests from the Philippines to Washington, there to instruct them so thoroughly that on their return they may have an adequate comprehension of what American religious, educational, and political institutions really mean, and thus be fitted to supplant the degenerate Spanish friars with a genuine energy for good. The Mission House at Washington is to be administered almost entirely by Paulists, since their training as missionaries has been found peculiarly successful in the work of the Roman Catholic Church in this country. The project is in the immediate charge of the Catholic Missionary Union. Another and more important event last week as regards the American Catholic University was the appointment of Monsignor O'Connell, long the distinguished rector of the American College at Rome, to the rectorship of the Washington University. This appointment is hailed by Roman Catholic Liberals as an indication of favorable regard by the Pope.

A Great Citizen

No account of the resources of New York at any time during the past three decades would have been complete if it had failed to contain an estimate of the character and influence of Mr. Abram S. Hewitt, manufacturer, lawyer, member of Congress, Mayor, philanthropist, and citizen. Public addresses of all kinds, books, and newspapers are full of reports of the wealth of the country, the volume of its products, the range of its manufactures, the extent of its commerce; but no report ever conveys an adequate impression of the moral and spiritual capital of the people. In the nature of things no such report can ever be made; but it would be better if less emphasis were laid on material wealth, and more emphasis on intellectual and spiritual wealth. Mr. Hewitt was prominently identified for many years with great business interests; he was an important factor in the financial life of the metropolis; but he was first and foremost, for many years, one of its representative men in all the higher fields of its activity; he was a great citizen.

Mr. Hewitt was a self-made man who had had the advantages of thorough education. Born in one of the Hudson River towns eighty-one years ago last July, the son of a very capable man of mechanical talent who had acquired a fortune and lost it, Mr. Hewitt's childhood was passed under very simple conditions. His earliest education was partly on the farm and partly in public schools; and he early developed a passion for study, tireless industry, and an indomitable will. In an intensely interesting account of his early life which he gave in conversation with a friend not many months ago, he said that, as a child, he hated poverty, not because it deprived him of luxuries, but because it circumscribed his activities and interests, and he resolved to acquire both an education and a fortune in order that he might live as he chose, and have the range and resources of freedom. When he was ready to enter college, he secured one of the competitive scholarships offered by Columbia to the boys of the public schools of this city, and it was characteristic of him that, later, he paid to the College the amount which he would have paid as a student on the usual basis. He was already self-supporting, and while he was a student at Columbia he was also a tutor. Never very strong, but always tireless, he not only supported himself, but he graduated at the head of the class of 1842. While he was going through the course he took a younger brother with him through the curriculum.

After graduation, Mr. Hewitt became acting Professor of Mathematics at Columbia. Later he studied law, but his health had been impaired, and in 1844 he went to Europe with Mr. Edward Cooper, son of the well-known philanthropist, who had been his classmate, friend, and pupil. A year later, on his return from Europe, Mr. Hewitt was admitted to the bar, but found his impaired eyesight a serious obstacle to his success, abandoned the profession, and embarked in business with his friend Edward Cooper. The new firm showed great energy and foresight. It was the first in the field to make iron beams and girders for fireproof buildings. It had great plants, and produced an immense amount of wire and structural iron. During the Civil War, as the result of Mr. Hewitt's study of the manufacture of gun-barrel iron in England, the firm of Cooper & Hewitt was able to render very important services to the Government by supplying it with material; upon which, however, it refused to accept any profit. The perfect integrity which was characteristic of Mr. Hewitt from the very beginning was united with a deep sense of moral responsibility in all business matters and especially in his relations with his employees. He said to a committee of Congress that from 1873 to 1878 the business of his firm was conducted at a loss of a hundred thousand dollars yearly; this was done partly, of course, to maintain the plant, but chiefly to avoid throwing a great throng of workingmen out of employment.

From an early period in his life Mr. Hewitt took a keen interest in politics, holding the Democratic view of great public questions and joining Tammany Hall at the beginning of its career. When the County Democracy was organized in 1876, he retired from Tammany, and became one of the leaders of the new movement. He was in Congress for

twelve years. He was Chairman of the Democratic National Committee during the Hayes-Tilden controversy; and, although he believed and declared that the Democratic party had carried the country, he was largely instrumental in securing a settlement of the controversy by the organization of the Electoral Commission. After a stirring campaign he was elected Mayor of New York in the autumn of 1886; a position to which he brought his instincts as a man of integrity, a man of affairs, and a man of executive energy. He never truckled to any group of men, and his refusal to raise the Irish flag on the City Hall on St. Patrick's Day, which was eminently sensible and wise, cost him the support of many voters. When the Brooklyn Bridge was opened in 1883, Mr. Hewitt's oration, although delivered in connection with a very impressive address by Dr. Storrs, was masterly in its insight into conditions and its interpretation of the occasion. From the very beginning he foresaw the rapid and great growth of the city, and was a conspicuous and tireless advocate of rapid transit.

To the last Mr. Hewitt's grip of affairs was firm, and his interest in all matters relating to the public intense. In the discussion which went on during the coal strike his letter pointing out the perils of denying freedom to labor was treated as a public document and discussed in every part of the United States. He was greatly interested in all educational matters. He gave his father-in-law, Mr. Peter Cooper, valuable assistance in the early organization of Cooper Union, one of the great centers of educational activity in this city; and it was due to his faith and energy that a large increase of the endowment for the institution was secured not many months ago. He was Chairman of the Board of Trustees of Barnard College, and an influential member of many clubs and associations of every kind. His business connections were many and intimate. He was a director in the United States Steel Corporation, in several railroads and coal and iron companies, and he was connected with many smaller enterprises. Whatever he had to do he did with his might, bringing to his work unusual natural sagacity, the experience of a long life, and absolute honesty and candor. For many years he was called upon on all public occasions to represent and interpret the higher life of the metropolis. With a genius for speaking the apt word in an effective and telling manner, his frankness made him some enemies, but secured for him universal confidence and respect. New York came to think of him only incidentally as a man of wealth, but chiefly as a courageous, sincere, and honest man; a citizen who cared only for the public good; a man whose party interests and affiliations were always held in subordination to the public service, and whose whole life was an illustration of the fundamental virtues and a reinforcement of the highest life of the city.

❀

Judge Taft

There is something both pathetic and inspiring in the latest reports from the Philippines of an event which at once denies to the Supreme Court bench one who would be an eminent addition to it, and secures to the Filipinos the continued service of one whom they rightly regard with gratitude as their friend and benefactor. It is well known that Governor Taft's inclinations, ambitions, and abilities combine in calling him to a judicial position. It was no small self-sacrifice for him to leave the bench when asked by President McKinley to go to the Philippines and there serve as his country's representative in framing for this people free institutions. The invitation extended to him by President Roosevelt to return and take a seat on the Supreme Court bench was an invitation to exercise his abilities in the line of his inclinations, and in a judicial position certainly unsurpassed, probably unequaled, by any other in the world. And he has resolutely said No to his inclinations and his ambitions, that he may continue to serve a people just emerging from barbarism into civilization, from despotism into liberty.

It would seem almost impossible for cynicism itself to attribute this action to any but the noblest motives. He elects to remain in a country the climate of which is enervating and, to the eager American, burdensome and repugnant. He foregoes many of the comforts of twentieth-century life in a twentieth-century Nation, to put up with physical

conditions in important respects hardly superior to those of the eighteenth century —conditions which have been further impaired by the devastations of war, pestilence, and famine. He turns his back on the social and literary attractions of life in Washington to continue in a life the very limited society of which is necessarily almost inseparable from official duties and relations. He declines an opportunity for a pursuit which would call forth the highest exercise of his intellectual powers for one of administrative detail which calls ceaselessly for that patience which is of all virtues the most difficult for an American to exercise. Removed thousands of miles from his native country, his countrymen know little of the work which he is doing, save by its results, and these are often misinterpreted and oftener belittled. That he is misrepresented by members of the party in opposition is perhaps to be expected—this is the common fate of all public men; but he has also to endure the harder trial of being misunderstood in his purposes, and sometimes thwarted in his plans for the benefit of the poor and the lowly, by men eminent in his own party. That his motives should be occasionally maligned by persons who are incapable of comprehending unselfish service, he could bear more easily than the fact that he is looked upon by some honorable and high-minded persons as the representative of a policy which they strangely regard as one of selfish commercial exploitation and overweening political ambition. When it is announced that he is contemplating leaving the Archipelago, where he has represented the Nation, whose spirit and purpose in that Archipelago have been so grossly misrepresented by some of his own American fellow-citizens, the natives whom he is serving so faithfully and unselfishly rise *en masse* to implore him to remain as their guide, their counselor, their protector. If they were a discontented and restless people, eager to throw off a yoke of bondage which had been imposed upon them, they would welcome his going, for in his departure they would see an opportunity for a new revolution; or they would at least witness his going, and the coming of his successor, with the sullen indifference with which a cowed and terrified people always witness changes in the personnel of their conquerors. Their spontaneous uprising entreat him to remain—and the sponta ity of the movement cannot be question since there could be no motive for insp ing it from without—is a sufficient re to those Americans who, with all th intelligence, have not understood t emancipating spirit of the American re resentatives in the Philippines as well it has been understood by the Filipin despite their ignorance. Judge Taft's co sent to forego the opportunity offered him to exercise his abilities in an office unexampled influence and power at hon that he may put them at the service of poor and ignorant people abroad, is splendid an illustration as modern publ life has afforded of the motto, "Whos ever will be chief among you, let him l your servant."

In the work to which with such unse ishness he has renewedly consecrated hi self he ought to have the hearty confiden and the united support of the Americ people. Neither ecclesiastical prejudic nor doctrinal theories, still less the narro and selfish interests of commercial clique ought to be allowed by the Americ people to thwart his beneficent purpose His general policy has been clearly d fined in his own mind and frankly ou lined to his countrymen. He has su cessfully initiated negotiations with th Vatican which, if successfully consum mated, will lead to the settlement of th friar question by the only constitution and honorable method, the purchase their lands for the benefit of the Filipin people. In that purpose he ought to hav the support of all Americans, Protestan and Roman Catholic. Under his admin istration an educational system has bee organized and carried forward whic promises to give the Filipino people i less than a quarter of a century the En lish language, not imposed upon ther but eagerly sought by them. No fals sentimentality should hinder this endeavo to furnish a linguistic unity to a peopl now hopelessly divided by their dialects a unity absolutely indispensable to thei national life. He asks America to reduc the tariff on all Filipino products seventy five per cent., that thus the Filipinos ma realize America's fellowship for them, tha thus they may be bound to us by commer cial interests, and that thus their industry

may be revived by the opening of a market to them. No miserably selfish interests of a few thousand sugar-growers or others should be allowed to prevent this so desirable consummation. He desires to admit Chinese laborers under certain carefully defined limitations, and to allow a larger liberty in the sale or lease of public lands than is now permitted, because he believes both are necessary for the revival of industry in the islands. We do not say that on these points his opinions should be conclusive; but Congress should consider them with prejudice in their favor, since his understanding of the conditions of the islands is necessarily better than that of any Congressman, and his disinterested devotion to the well-being of the islands has been demonstrated beyond peradventure. He remains in the Philippines that he may set the Filipinos free from the burdens and entanglements imposed upon them by their past history; that he may help them to obtain law, education, industrial prosperity, freedom, self-government. His example should give new inspiration to all Americans who believe that National honor requires of America that she should do something better for the Filipinos than leave them to work out their own destiny without assistance, and his leadership should be loyally accepted by all who share in his beneficent purpose.

❀

The Reality of Sorrow

To the Editors of The Outlook:

Is it wise or helpful to insist that sorrow and suffering are essential in developing character or spirituality? Are there not too many sufferers already who attribute their affliction to a disciplinarian God, when the real cause is their own or some other person's intentional or unintentional wrong-doing? Is not most suffering and sorrow the result of wrong conditions? Can that which is wrong ever be right? In an article under title of "The Heart of Sorrow," in the December 6 issue of The Outlook, you say: "The heart must bear the full shock of its loss if it is to make the spiritual gain which comes only out of deep experiences," and "It is in the pain of separation that the deepest joy of reunion is born; it is in the anguish of loss that the bliss of final recovery is prepared."

Many thoughtful and sincere persons believe that God purposely permits or inflicts suffering in order to develop richness of character. If this is true, all who desire spiritual growth should welcome each new burden or sorrow, and even put themselves in the way of experiencing more suffering.

Sickness, grief, and the effects of sin, then, are good, and no effort should be made to avert them if we wish "the final richness of spirit which comes from great tribulation patiently borne."

To maintain the position taken by the writer of "The Heart of Sorrow" we must, to be in accord with the divine plan, eliminate all deeds of charity, cease efforts to relieve suffering or sickness, and only the medical aid necessary to prevent death should be employed, and possibly even death should be welcomed if "it is in the anguish of loss that the bliss of final recovery is prepared." What can be said in regard to Christ's example and teachings concerning relief to suffering humanity? If sorrow brings rich blessings, did not Christ interfere with a larger and later joy in store for the Widow of Nain when he restored her son? The Saviour's teachings seem perfectly clear that the realization of heaven within us is the elimination of all suffering. If it is true, as The Outlook says, that "the deeper the suffering . . . the purer and truer the faith which issues from it," then we must not give a cup of cold water in Jesus' "name to one of these little ones," nor help a brother in distress; no need of establishing hospitals or orphanages; and much of the research and patient experiments of the medical schools has been unavailing except for material benefit, for all this is a blow at God's spiritual developing process. We believe that too much stress is given to the few hours of agony in Gethsemane and on the Cross, and far too little to the patient achievement of spirituality during the eighteen years—following Christ's twelve-year-old episode in the Temple—when the consciousness that he was about his Father's business inspired and fitted him for the manifestation of a character which could bear patiently suffering which was the outcome of sin and malice.

The point we would like to emphasize is simply this: in spite of great sorrow and in severe trials, there is so much of inherent good in mankind that it conquers all, and causes the sweetness and nobility of God's children to radiate with a beneficent effulgence.

Does not the man who carries the light with him into the darkness appreciate that light as much as the one who only seeks a light because the darkness overtakes him? To the one who carries the light, darkness has no terror, but others must grope till they find an escape. So character developed in the brightness of Infinite Love is surer of its ground and can endure to the end—even as Christ endured—the agony of persecution, loneliness, and the Cross.

Boston, Mass. WALTER L. COLBY.

Our correspondent has misinterpreted the spirit and aim of the editorial to which he takes exception. There was no endeavor in that editorial to emphasize the sorrows of life or to preach the doctrine of suffering as an end; the maste

force is life, not death; the key-word is growth, not decay; the final condition is joy, not sorrow. Christ's death was an incident in his life, not its supreme moment; redemption is the positive force in life, not condemnation. All these great truths, which lie in the heart of the view of life expressed from week to week in the pages of The Outlook, were assumed by the writer of the editorial from which our correspondent dissents. The coming of Christ has set the movement of the world to a new key, and has laid an immovable foundation for faith, peace, strength, and joy.

Nevertheless, there is a vast amount of sorrow in the world, and this sorrow bears its fruit in higher development of character, and this result is secured, not by making light of sorrow, but by bearing its full impact with patience, sweetness, and faith. There is no gain in striving to minimize the facts of life; in striving to escape its realities by denying their existence. This is an old and oft-tried experiment, but it has never been successful and it never will be. It is idle to blind one's self to the dark side of life, and it is intellectually immoral to ignore its somber realities. This method of solving the problem sometimes succeeds for a time, but it is smitten with unreality at the heart, and in the end it breeds the worst kind of skepticism. The religion which is to satisfy men must look the facts of life full in the face, accept them in their deepest significance, and rise above their terrible teaching by interpreting them as part of a larger order of things. It is idle to try to escape the full play of all the forces of life; they must be met squarely, honestly, unflinchingly.

There is, at the moment, a revival of this tendency to escape the deeper perplexities by treating the terrible realities of sin and suffering and death as if they were illusions. It is even said that the sufferings of Christ were dramatic and spectacular—a show of anguish to produce certain moral impressions on the world. The fundamental and corrupting unreality of this treatment of the scene on Calvary does not seem to dawn on many people; they overlook the appalling logic which would sweep away the very grounds of faith if the Divine Sufferer in the hour of his bitterest anguish was acting a lie. No one can read that simple, direct story in the spirit in which it is recorded without feeling the reality of the anguish which made that hour memorable in the history of a suffering race. If Christ did not suffer and die, in the full, simple, normal meaning of those words, then, to modify Paul's phrase, we are of all men most miserable.

It is one of the most convincing evidences of the truth of Christianity that it evades no fact, denies no experience, ignores no conditions. It plants itself resolutely on the facts of life, and faces all forms of experience with a gaze which does not falter but pierces to the heart. Christ was born in a manger, the lowliest of cradles; thus, at the beginning, the Son of God accepted the humblest condition of human life. He grew up as a child obedient to his parents, and set the seal of sanctity on the home; he had his temptation in the desert, but he was never an anchorite or a yogi; he lived with his fellows, shared their fortunes, took part in their occupations, spoke their language, and so, with divinest insight, struck a fatal blow at the purely human and half-atheistic idea that a part of life is sacred and a part secular; he wept at the grave of Lazarus, and made it clear that grief was as real to him as to the sisters of the dead; he sweat great drops of blood, he cried out in anguish of spirit in the loneliness and pain of his last hours, he died as other men die. In the lowliest cradle his presence touched all human life with the beauty of a divine sonship; out of the blackness of the grave, where the mystery of life is most appalling and impenetrable, he came victorious and appareled in heavenly light.

Here at last was a religion which looked sin and sorrow and death in the face, recognized their reality, and yet rose above them; at once the most simple, tender, human, real of all interpretations of life, and at the same time the most glorious, spiritual, and radiantly prophetic of the victory of life over death, of goodness over evil, of God over all the forces of unrighteousness. The message of Christ was a gospel of glad tidings; it proclaimed deliverance from sin, peace in trial, immortality. It was a gospel of joy, but it recognized the sadness of the world; its mighty appeal lay in the fact that it accepted all the

conditions which men felt and knew to be real, and rose victoriously above them. Over the manger the angels sang, over the sepulcher the Easter bells sounded their glorious music.

Christianity is the religion which interprets sorrow in the light of immortal hope; that is one secret of its power. The worship of the Greeks was beautiful and satisfying to the young, the strong, the happy; but the great majority of men are not at ease in life. "One man in many millions, a Heine," wrote Matthew Arnold, "may console himself, and keep himself erect in suffering, by a colossal irony of this sort, by covering himself and the universe with the red fire of this sinister mockery; but the many millions cannot—cannot if they would. That is where the sentiment of a religion of sorrow has such a vast advantage over the sentiment of a religion of pleasure; in its power to be a general, popular, religious sentiment, a stay for the mass of mankind, whose lives are full of hardship. It really succeeds in carrying far more joy, far more of what the mass of mankind are without, than its rival. I do not mean joy in prospect, but joy in possession, actual enjoyment of the world." And he ascribes what he calls the fortune of Christianity to "its drawing from the spiritual world a source of joy so abundant that it ran over upon the material world and transfigured it." Christianity has not made the mistake of underrating the strength of that which it opposes; it recognizes the full force of the sadness and sorrow of life, and pierces, transfigures, and rises victorious above them.

The reality of a victory depends on the reality of the struggle that preceded it, and the divine power of the religion of Christ is measured by the power of those things which it overcomes. Suffering does not exist, in the Christian view of life, as an end, but as an instrument of education. It is not only an individual experience; it is a part of the divine order of the world; it is involved in the great process of development, which is not only the unfolding of the order of nature but of the spirit of man. It is the process by which and through which that spirit comes to clear consciousness of itself, of its divine possibilities, of its spiritual nature and destiny. It is wrought into the very fiber of growth. Harnack, from a purely philosophical point of view, has stated this profound office of suffering with nobility as well as clearness of insight: "Any one who looks into history will find that the sufferings of the pure and the just are its saving element; that is to say, that it is not words but deeds, and not deeds only but self-sacrificing deeds, and not only self-sacrificing deeds, but the surrender of life itself, that forms the turning-point in every great advance in history. In this sense I believe that, however we stand as regards theories about vicarious sacrifice, there are few of us after all who will mistake the truth and inner justice of such a description as we read in Isaiah liii.: 'Surely he hath borne our griefs and carried our sorrows.' 'Greater love hath no man than this, that a man lay down his life for his friends'—it is in this light that Jesus' death was regarded from the beginning. Whenever any great deed has been accomplished in history, the finer a man's feelings are, the more sensible will he be of vicarious suffering, the more will he bring that suffering into relation to himself."

The reality of suffering is one of the great facts in the Christian faith; a fact wrought into its very heart. Christianity is the greatest of all forms of idealism because it builds on the solid foundation of reality; because it accepts the world as the world reveals itself in the experience of humanity. It regards the process of life, not as fundamentally intellectual, but as fundamentally moral; it looks upon the world, not as an idea, but as a fact, the fruit and product of the action of the will. Hence the tremendous emphasis it lays on character; the conformity of man's life to God's will. Hence its steady and resolute refusal to dissolve the fact of sin into an unmoral process of growth, and its equally resolute grasp of suffering, not as fiction of the feelings, but as part of the process which gives an idea clearness, reality, moral weight, and meaning, by passing it into character and so making it part and parcel of a man's immortal self. The education of the race is not an end but a means; suffering is not a finality but an incident; but it is wrought into the spirit of man that it may leave there its purification, its tenderness, its clearer and holier vision. The cup of sorrow is held

to all lips, but they that drink are thereby strengthened to press on to that heritage of peace, possession, and bliss which, like the vision of the great white rose in Dante's Paradiso, blooms not only at end of the journey, but shines from a and distills its secret sweetness throu the darkest hour of the pilgrimage.

The Impressions of a Careless Traveler

VI.

April 9.

AS we sailed past Robert College yesterday afternoon on our way to the Black Sea, the college boys were out in force, and greeted us with cheers and the waving of handkerchiefs and flags; prominent among the latter was the American flag. I believe this is their custom whenever an American steamer passes up the Bosphorus, and it indicates the friendly feeling for America which at least the foreign peoples—the Bulgarians, Greeks, and Armenians—are imbibing at the College. This incident led to a rather significant conversation with a fellow-passenger who asked me what the demonstration meant, and, on my telling him that this was Robert College, expressed in perfectly courteous but also in vigorous terms his disapproval of the attempt to proselyte to other faiths a people content with their own. He indicated his understanding that Robert College was founded for the purpose of educating men for the ministry, and could hardly credit my assurance that it had no proselyting purpose. In fact, it has no theological department whatever. It is no more a missionary college than Yale or Harvard, and is a Christian college in the same sense and in no other. Its professors are not all of the same religious faith; its professor of Greek language and literature is a devout member of the Greek Church, its professor of the Turkish language and literature was formerly a Mohammedan—whether now or not I do not know. Why any one should approve of Yale and Harvard, of Oxford and Cambridge, of Leipsic and Berlin Universities, and disapprove of Robert College and the American College for Girls in Constantinople, I cannot understand; for the latter are doing for Turkey exactly the work which the former are doing for Germany, England, and America. It is true that attendance on chapel exercises is compulsory, but most of the students are nominal Christians, and chapel exercises in Robert College con in reading the Psalms together, singi and prayer; and so tactful are the coll authorities that their morning services conducted in that curious sing-song m ner, half intoning, half recitative, to wh the Armenians and the Greeks are acc tomed in their church services. I h difficulty in persuading my fellow-pass ger that the College was not a veil attempt to proselyte; I am quite sure should have failed entirely had I happily had with me a copy of a lett

---

[1] For the information of its readers, some of wh otherwise might be difficult to convince, The Outl lays before them a copy of this letter, which will be fo in the Report of the President for the thirty-eighth y of the College (1900-1901), with the paragraph from t report which introduces it and explains its genesis:

The most distinguished and progressive Bishop of Orthodox Eastern Church has just been unanimou chosen Patriarch of Constantinople and received w wild enthusiasm by the people. He has held this of once before, many years ago, but he was then too p gressive for the times and was forced to resign. He s his Grand Vicar to our Commencement, with instr tions to make an address if the opportunity occurr but we had no addresses and the Vicar was ordered send me a letter, which was also published in the Gr papers. This letter cannot fail to interest the Truste and I add this translation of it to my report:

"To the most noble and most learned
Director of Robert College.

"Most noble Sir:—The following is an address wh His Holiness directed me to deliver yesterday on my vi to your College, which I now have the pleasure to tra mit to you.

"'Having come among you, Honorable Gentlem by order of His Holiness, my most venerable Master gives me great pleasure to say that His Holiness h always followed with great interest the work of yo most important and most noble institution. His Ho ness, my most venerable Master, duly appreciates yo labors and care that the education which you give sh make good citizens and moral men, who will act society as worthy and honest members of it, loving th neighbors, not rendering evil for evil, but good for evil.

"'But the appreciation of His Holiness surpasses th limit, for he admires and praises you for working harmony with the teachings of the Apostles, doing go without any afterthought, which might bring forth sca dals. You respect the teachings of our Lord Jes Christ, who said, "Woe unto him through whom scand comes." Your enviable mission, as is proved by facts, the mission of making good men, not of corrupting co sciences; to make good Christians, not perverts from th Church. For these reasons His Holiness gave me th fatherly order to express to you his thanks and prai for your work, inasmuch as our nation, on account unhappy circumstances, has not been able to found suc an institution as Robert College.'

"Transmitting to you, word by word, this father message of His Holiness, I take the opportunity to sig myself, with great respect and brotherly love for you,

"THE GRAND VICAR CHRYSOSTOME."

addressed by the Greek Patriarch—the head of the Greek Church—to President Washburn last year, which should be quite conclusive to any doubter.

Robert College on the Bosphorus, for boys, and the American College for Girls opposite, at Scutari, have sent back to their homes hundreds of boys and girls trained to do their own thinking and certain to carry a new spirit of intellectual and spiritual life into their various communities. There is far more ground for hope for a new Turkey in these men and women than there is in European interference or an American protectorate.

April 10.

This morning we arrived at Trebizond, a Turkish port on the Black Sea, about six hundred miles east of Constantinople. One step has been taken towards that unity of interest between England and America which some of us hope will grow much more rapidly in the future than it has in the past; a custom has grown up according to which, in any port in which there is an English consul but no American consul, the English consul represents American interests, and *vice versa*. The American Consul at Constantinople telegraphed to the English Consul at Trebizond of our expected arrival, and before we had breakfasted his dragoman was on the steamer to meet us. We had in landing the first disagreeable experience we have met from any fellow-passenger. The dragoman had come for us in a private boat; but, in spite of the expostulations of the sailors stationed at the bottom of the landing-ladder to help passengers off, three men, two Germans and one American, insisted on jumping into our boat. Our party of five were put into a carriage and driven through the town to the Consul's house. We were among the first of the passengers to get into a carriage, and the Consul's cavass—a kind of constable or policeman—was on the box with the driver, so that we were in a way identified as the English Consul's guests. It is rarely that an English steamer lands at Trebizond, and still more rarely do Americans land there, and we learned afterwards that great preparations had been made for our coming. We found, therefore, the streets quite full of observers, to whom we were as great curiosities as they could be to us. I think it was the first time that I ever realized that a plain black traveling suit could be a curious costume. We drove up the hill as far as the carriage could take us, and then walked, it seemed to me a quarter of a mile further, up a tortuous, ill-paved lane, practically impassable for a wheeled carriage, to the house; where the Consul received us as his guests, with characteristic, courtly English manners, and conducted us up the considerable flight of steps which led up from the street to the front door. What were our plans? We had none developed. Would we have some tea? No, thank you. He hoped, then, we would all come back to luncheon. We should be delighted. He would suggest that we might like to walk over to the American missionary's house, Dr. Parmlee; the cavass would conduct us, and then would conduct us from there to the Governor's house, where a sword dance was to be given by the Governor's orders for the benefit of the ship's passengers; after that we could return to lunch. This accorded with our ideas, and the plan was carried out accordingly.

My visits to a Methodist minister's in Madeira, to Robert College and to the American College for Girls in Constantinople, and to Dr. Parmlee in Trebizond have clarified and confirmed somewhat hazy ideas on the subject of foreign missions, to which I shall perhaps give editorial expression hereafter. The half-hour spent under Dr. Parmlee's roof has left on my mind a strangely commingled feeling of the pathos and the splendor of missionary service. Dr. and Mrs. Parmlee and their daughter—who has just returned to them for a visit after a brief educational experience in the United States—are quite alone in Trebizond. He is actually a kind of bishop, having oversight of a number of native preachers, who are scattered throughout what may by courtesy be called his diocese, but I doubt if once a year he sees an American or much oftener any other Englishman than the Consul. His wife and daughter are carrying on a kindergarten, which takes in the children of some of the "best families" in town, since it is the only school of the sort, or perhaps of any description, for little children. We went into the school-room, which was quite

bare of ornament, and Miss ——, who is a kindergarten expert, pronounced their songs and games well up to the standard. We afterwards met one of the native preachers of the town at the Governor's house, who told me that he was trying to organize and carry on a kind of young men's club to work against the saloon, which was the greatest enemy he had to contend against—and this in a Turkish port. There seemed to be something at once infinitely pathetic and worthy of all admiration in the heroism of this missionary and his wife and daughter, cutting themselves off from all social companionship and devoting themselves to this isolated life in order to carry the good news of the goodness of God to a people who had never learned from their priests anything but to fear God. The cavass grew impatient, and we finally had to tear ourselves away from the school and follow him to keep the appointment at the house of the Turkish Governor for the sword dance to be given for the benefit of the ship's company. When we reached there, the entertainment had already begun. Fifty men or so in peculiar and picturesque costumes were going through this dance, sword in hand, advancing, retreating, stooping, rising, turning about, and forming strange and even fantastic combinations. The most characteristic feature of the entertainment was the dancing by two men, or at times two or three boys, armed with naked swords which they brandished at each other in the most theatrically alarming manner. I was not surprised to be told that these men, who had been brought down from the mountains for the purpose of giving the entertainment, were not above reproach; some of them I should not care to meet alone on the road in a dark night.

After the sword dance we returned to luncheon at the Consul's house. He has been at Trebizond for many years, and his account of the massacres of the Armenians in that city was extremely dramatic. One incident he told us illustrates the character of the massacre and the motives which impelled it, and at the same time the value of having in the service an experienced Consul with a knowledge of the language of the country. After the worst massacre of the first day was over, he was looking over his garden wall and saw coming up the narrow lane which led by his house a Greek porter, heavily laden. At the upper end of the street was a Turkish soldier, who drew his gun on the porter. The porter called out in terror, "Don't shoot me; I am a Greek." "No, you're not a Greek," responded the soldier; "you're an Armenian, and, anyway, I am going to shoot somebody." Thereupon the Consul called out from his vantage-ground above, "Don't shoot him; I know he is a Greek." The soldier sullenly lowered his gun, and let the porter pass. I think also it was this Consul who told us that the Governor had specially prepared for the coming of the Prinzessin by having the streets cleaned and the dogs and the beggars shut up. As compared with Constantinople, the streets were marvelously clean, and in the city we saw scarcely a dog or a beggar—no street dogs, I think, and only one beggar, and he eating on the steps of a Greek monastery the dinner which had been given him there.

We sailed about four o'clock. Just before sailing I got my first glimpse of a veritable caravan; with our glasses we could watch the camels kneeling on the distant dock—not the one from which we had embarked—to receive their loads, and later the long procession (a fellow-passenger reported a hundred and fifty, but I do not know how he knew) winding up the hill in the beginning of a journey of some hundreds of miles into the interior of Persia. Nothing I have seen has more clearly brought home to me the fact that we are really in the Orient, or at least upon the edge of it.

L. A.

A FIGHT FOR THE CITY

THE STORY OF A CAMPAIGN OF AMATEURS

BY ALFRED HODDER

Private Secretary to District Attorney Jerome

II.—The Drag on the Ticket

FEW even of the experts in the management of primaries and in the delivery of votes at the polls estimated rightly the moral effect on the great multitude of Devery's subjects of the hunting of John Doe. It was the Citizens' Union that, through Mr. Fulton Cutting, forced Mr. Jerome's nomination on the managers of the Republican party, who did not in the beginning intend that he should take the platform, or be supported by the party funds, or indeed be elected. He was in their eyes "unsafe:" he could not be counted on to say the right thing; his one recommendation, his doubtful recommendation, was that he could make himself talked about; he had a turn for getting himself written up in the newspapers. When he learned that he was not to be permitted to speak from the platform with the other candidates on the Fusion ticket, he announced his intention of establishing headquarters in the heart of the East Side, and of meeting between the hours of ten and five, Sundays not excepted, any one who wished to visit him and ask him questions about the policy that, if elected, he intended to pursue. "Carrie Nation Jerome" speaking his mind in private was likely to be so impolitic in his utterances that it was decided that he should be permitted to speak from the platform, where he might at least be checked by the presence of his colleagues; at the worst, it was reasoned, he would hang himself if he were given rope enough. "Impolitic" is a politic epithet for truth-telling at a time when lies would be more profitable. Opening headquarters on the East Side was regarded as another proof of sensationalism and eccentricity. Mr. Jerome himself gave in private a different account of the matter. "What is the use," he said, "of opening headquarters in the brownstone district? The voters there are for the Fusion ticket whether we tell the truth or not; the voters there will never be the wiser whether we tell the truth or not. The side to win votes from is the *other* side."

Few even of the experts in party management among either the Democrats or the Republicans believed that Mr. Jerome would "run well"—in other words, would be a vote-winner; on the contrary, they regarded him as the extreme opposite of a vote-winner; by every article in their creed, which is the creed of tentative prudence, he was a vote-loser; and mentally they labeled him "a drag on the ticket," and filed him for reference in the pigeonhole reserved for disastrous necessities. It was not known that before large audiences he was an effective speaker; it was not known that he could command before them an effective personal bearing; it was not known that he had excited among the public a widespread curiosity and enthusiasm. Men of his own social world were keenly alive to the opportunity for ridicule that he had given, and his own friends were keenly alive to the technical indecorum of a judge's presiding at the breaking of doors and holding court in a gambling-hell. It is difficult to overstate the shrinking of the average smug and successful business man in the United States from ridicule; he has so far mastered Chesterfield's ideal of dress—that a gentleman's garb should be expensive and in fashion but never conspicuous—that he has applied the principle of it to the soul, and in a public officer regards a burst of generous indignation, or of unconventional

energy, with the same sense of amused superiority or of uncomfortable surprise with which he notes on an acquaintance an inordinately checked suit of clothes and a scarlet cravat. The personal dignity of a friend and of a magistrate is to him of far more consequence than the exposure of an elaborate system of crime, or the execution of the law. Full-fed gentlemen in clubs made *bons mots* over their wine; personal friends cautioned and expostulated; and prosperous politicians assured themselves that in his first speech the candidate for the District-Attorneyship would meet with what is called in vigorous slang "a frost." He himself felt, keenly and bitterly enough, the defection of men who should have been publicly at his side; he learned what no man forgets—what it means even for a season to stand seemingly alone; or, rather, what it means in fact, and manifestly to the eyes of all except the merest stranger, to be standing alone. A few men much younger than he busied themselves with his canvass; not one of them had known him for more than a year, some of them for but a few months; as friends they were as conspicuously new as an overlustrous silk hat; lifelong and tried associates were obviously absent, and both his visitors and his new acquaintances remarked their absence, and asked themselves, and asked one another, what sort of man on more intimate acquaintance he was wont to show himself, that practically no one of his own age that had been formerly his colleague or companion now was playing an active part in his support.

His first speech—the first he had ever made before a mixed audience—settled a great many questions. Before the speaking began, cheers for Jerome followed hard on cheers for Low. He was fifth on the announced list of speakers, but the audience *en masse* called for him when Mr. Low sat down, and declined to hear any one else until Mr. Cutting, the Chairman, assured them that Mr. Jerome was not in the building, and that he should be introduced the moment he arrived. He arrived in the midst of the discourse of another candidate, and stood in the background, sheltered by one of the pillars of the admirably constructed hall in the basement of Cooper Union, until a number of the audience discovered him, and passed the word, and the speaker's voice became inaudible among the cries of "Jerome! Jerome!" Mr. Cutting's introduction was significant: "I have no need," he said, when he could make himself heard, "to introduce this gentleman." After a moment's jesting, Mr. Jerome, with a cautiousness in which his legal training served him well, set aside all party catchwords, and, with consummate dexterity and earnestness, narrowed the issues of the campaign down to a few simple propositions that all men could lay hold on and remember, and that no "true man," as the old phrase ran, could doubt. Mr. Cantor, his predecessor on the platform, had been elaborating the text "Turn the rascals out," and predicting that the precise day of the rascals' exit would be New Year's Day of nineteen hundred and two.

"'My learned friend, Senator Cantor,' said Mr. Jerome, 'is evidently possessed with the idea that in local politics there will soon be a moving-day. He is of opinion that for Tammany Hall next year moving-day will come, not on the first of May, but on the first of January.'

"'You bet it will!' shouted a deep voice in the center aisle, amid a chorus of cheers.

"'We'll move 'em up to Albany,' shouted some one else.

"'Not quite so far up the river,' the Judge said quickly; 'Sing Sing will do!' The audience went mad with delight. Continuing, he said:

"'I am not in this campaign to discuss issues. I am in this campaign to fight. Issues imply that there is something to be discussed. Issues mean that there is something upon which honest men may honestly differ. I have never known any one take issue on the commandment *Thou shalt not steal;* and I have found reason to believe that one of the basest forms of stealing is blackmail. There is no question of politics in this campaign. There can be no question of politics without political issues and political parties; and in this case there is no political party on the other side. I do not come here to vituperate all those who are opposed to us; I have many good and lifelong friends in Tammany Hall—men whom I respect, men whose hands are as unsoiled by dirty money as my

own. But the days when that organization was a political party, when it had political leaders and was dealing with political issues, have passed away; and to-day the men who are dominant in Tammany Hall, who control its machinery and dictate its policy, who determine its policy and destinies in spite of the opposition of many and many a decent man in the organization, are not politicians; they are grafters; they are working for their own pockets all the time. And as against them and the candidates whom they have nominated, there is no issue in this campaign except the issue of decency against indecency, honesty against theft, law against lawlessness.

"'For six years and a half I have occupied a judicial position. The people of this city, and of every city, have a right to ask that their judges do not enter into politics. But can they go farther and ask that their judges shall not pursue crime? Do they ask—can they ask—their judges, when the very foundation of social life is threatened, to wrap themselves in the judicial ermine and prate of judicial proprieties? I do not believe it. Wrongs, cruel wrongs, bitter wrongs, come to the poor and the weak from the men who rule this city with an iron hand; come to the poor and the weak, not to the rich and the strong; the rich and the strong might fight. These wrongs come to the knowledge of most of the well-to-do among us in isolated instances only; but to me, sitting where I have during the past six and a half years in a minor criminal court, presiding in that time over some eighteen thousand cases, these wrongs have not come in isolated instances only; they have come day by day, they have come until they have burned into my soul, they have come until I have felt that if only there were a vigilance committee in this city of ours we should free ourselves by the strong hand.'"

Mr. Jerome is not what in ordinary parlance is known as an orator; he has not the powerful, dulcet, variously modulated voice that by mere charm of music wins attention; he does not deal in striking metaphors or stately verbiage; he knows almost nothing, or at least practices almost nothing, of the art of graceful and persuasive gesture. His voice is harsh, his speech is blunt to the verge at times of downright rudeness, and his gestures come as God pleases. But during his canvass he knew what he was talking about as he knew his ten fingers, and refused to be drawn into the discussion of party questions, or questions of politics in general, or anything in general, or anything at all except the points at issue in the campaign in hand; he had, by inheritance, wit and fun and the gift of telling a story, and, more than all the rest, when he grew earnest he had the accent of daring and sincerity. It is perhaps doubtful whether all the world loves a lover; it is not at all doubtful that all the world respects a man who can persuade it that he is willing, in the interest of the public, to risk his skin, or his fortune, or anything that is his. Decency against indecency, honesty against theft, law against lawlessness, and the defense of the homes and the pockets of the poor, became, from the time he uttered the words, the lines on which the battle was fought. "I have seen more than one election lost," he said in conversation, "by letting Tammany raise the cry of party loyalty and National issues, and by a set of sea-lawyer fools giving their attention to arguing the record of the Republican against the Democratic party. I have yet to learn that either of the great National parties publicly sanctions blackmail by police captains or by district leaders. The way to win an election is to stick to the point." The crisp comment of the New York "World" the following morning was: "Mr. Jerome, whose probable course as a campaigner has been an enigma, quickly cleared the mystery. Although he was fifth on the list of speakers, he had gained the first hold on the audience before he had been talking five minutes." He had gained the first hold on the audience before he came into the hall, though the shrewdest party managers were little apprised of it. What he did in his first speech was to satisfy and to exceed expectation. An official high in the local management of the Republican party came to Mr. Jerome the next morning and said: "Travers, I owe you an apology, and come to make it. I opposed your nomination, and opposed your being put on to speak; and my apology is that you can have all the money we've got. So far as we can see,

the drag on the ticket is the whole show." As it happened, he did not need and did not take any of the money. As it happened, too, it soon became embarrassing to speak from the same platform with him; out of courtesy, he sat or stood for many and many a half-hour in corridors, waiting his turn to speak; but no courtesy on the part of the man himself could make it pleasant for another man on the ticket to rise and address an audience that was crying, "Jerome! Jerome!" and to risk being cut off in the middle of a sentence if Jerome were discovered in the house.

It is a fair surmise that a clear majority in each of his audiences came to hear him for the first time out of sheer curiosity; any one acquainted with an urban population knows what it means for drawing an audience to have made a hit—to be what the newspapers call, in newspaper English, "the sensation of the hour." They came a second and a third time very simply because they liked him—because they believed in him. The urban population in the United States is as frivolous as you choose in its amusements, but no one is likely to deny that it is in intelligence quick and keen; the man they like is in all probability worthy of liking, and the man they believe is worthy of trust. There is a marked difference in the impression made by the report of Mr. Jerome's words and conduct and the impression made by the man himself. The average voter in the United States is an expert in political campaign promises and campaign rhetoric, and is as cynically wary of them as he is of business projects the prospectuses of which demonstrate mathematically a profit too good to be true. By report in the newspapers the legend about the candidate was too good to be true: according to report he was too disinterested; he was too reckless; he was incredible; he was a superlatively clever demagogue, or a fanatic, or a "fakir," or anything else you please except what he represented himself as being. But the average voter in the United States is quite as expert in men as in promises and rhetoric; and face to face the candidate was unmistakably a hardy, offhand, athletic, pugnacious man of forty, who said from the platform exactly what he would have said, and had said a hundred times, to a group of friends about a table in an uptown club; though he was unmistakably more desperately in earnest than in uptown clubs it is the fashion to appear. "I have lived forty-two years," he once said in conversation, "and a man of that age, who is not willing to stand or fall by his judgments and to speak them out, must have a column of fried mush for a backbone, or else be an absolute fool." He told the "plain people" what he thought, and what he felt, and what he was willing and what he was not willing to do, as simply as if they were intimates and friends; he dealt with them as with intimates and friends; he trusted them, and they returned the compliment—as I believe they always do. In the United States I fancy ninety-nine men fail of their heart's desire from being astutely politic, for one that fails from being reverently faithful to his convictions and reverently bold. "The main satisfaction I have had in this campaign," he said over and over again while the canvass was yet unfinished, in transit between speeches, or at supper when the speeches for the evening were done, "is that I can say in public just what for years I have wanted to say in public, and in private for years have said. By Heaven, it's up to the public! If they want Unger, they can have him, and welcome." Mr. Unger was the rival candidate.

It was a mark of his offhand friendliness for the plain people that in the majority of his short addresses to them he did little more than show himself and make their acquaintance. "Gentlemen," he said, "I have not stopped here to discuss the issues of this campaign, in five minutes. You know, better than I can know, or any man as well-to-do as I (though as rich men are counted I am a poor man, living as I do mainly on my salary), what the government of this city for the past four years has meant to the poor. I have come here simply that you might look me over and size me up, and make up your minds whether you would rather have me in a position of power over you than Tim Sullivan, and Frank Farrell, and Max Hochstim. I have never met a man myself, and heard him talk for two minutes, without being able to make a reasonably sound judgment of his integrity, loyalty, intelligence. I know what politics are, and that it is not so much what a man

says that counts as the estimate you form of him when you listen to his voice and look into his eyes. There is one thing, however, I want you to do; and that is, if you can find any meeting at which Mr. Unger and Mr. Fromme are to speak, you go to those meetings. I do not know of anything that could more justly and more strongly move an honest, intelligent man to vote for the Fusion county ticket than to sit and listen for five minutes to either of those eminent gentlemen."

In the meantime Mr. Jerome had established headquarters as little like the typical and traditional headquarters of an important candidate as can well be imagined. He occupied two uncarpeted rooms on the floor above a saloon; the walls were garnished with caricatures of the candidate. There was not actually a sign over the door, "No admission except on business," but there might well have been. The visitor was met with a courtesy and a promptitude of inquiry as to the occasion of his coming that made him state his business hurriedly, if he had any, and, if he had none, feel that he had entered the wrong door and hasten his farewells. There was no provision for hospitality—for handing out cigars and treating guests to small bottles or brandies and soda—and as little for the accommodation of mere idlers; and the jackals of American politics, the men with vital information or with votes to sell, were not, indeed, kicked down stairs, but were so much discomfited that at times they would have found relief, I fancy, in a bit of violence. They were dismissed in a chorus of irony and a dumb-show of cordial smiles, more ironical in their way than any spoken word. They were advised, with infinite suavity of demeanor and phrase, to go sell their wares to Tammany; they were advised that Tammany had a superabundance of money to spend on the campaign, and that all Jerome men hoped they would spend it, so far as possible, improvidently. The dignity of these headquarters was, in the main, due to John Henneberry, who had been early designated by Colonel Robert Grier Monroe as the one man, if he would undertake the task, to act as Mr. Jerome's private campaign manager. Mr. Henneberry has a talent for making two bare rooms look like the offices of a great commercial house in high prosperity, and for making both the men who work with him in a political campaign and their chance visitors feel it in their bones that the candidate for whom he is working is certain of success. After an interview with Mr. Henneberry, the man who had staked money against Mr. Jerome's election incontinently hurried to the Hoffman House and hedged. Mr. Henneberry was too untroubled and cheerful for it to be imaginable that he was on a losing side. For reasons that had nothing to do with mathematical probabilities, Tammany kept the betting odds against Mr. Jerome at two to one, and the men who had talked with Mr. Henneberry "chased the money." Sometimes they found it, cash in hand; but more often they found a promise, simply, from some chance-met sport, who had been offering and urging the odds, that he would step out and get the bank-notes. He stepped cut, and was not seen again. He vanished.

Mr. Henneberry was a man of middle years, the president of the many-chaptered Catholic Benevolent Society, and an active politician, though even Mr. Henneberry was exercising the functions of campaign manager for but the second time. The rest of Mr. Jerome's staff, as I have said, were amateurs in politics; they were volunteers, and youthful volunteers. Howard Gans, who by request became campaign treasurer, was a rising lawyer, as academic, as ironical, as languid, as the Harvard graduate of tradition, or as the new Premier of Great Britain; in especial if it be remembered that in daily speech the modern academic fashion is for slang. He had in an earlier campaign delivered from the tail of a dray addresses perhaps too closely modeled on the ancient oration to hit the humor of the modern vulgar, and had seen his audience stray away toward neighboring places of refreshment; his own account of the matter is that he was better than a platoon of policemen for dispersing a crowd. As a Deputy Assistant District Attorney under Mr. Philbin, Mr. Jerome's predecessor, he had been of material assistance in the hunting of John Doe. As treasurer his first act was to refuse to accept a penny of his candidate's money, and to undertake to raise a sufficient fund for the campaign without his aid. He was himself

far from being financially in a position to guarantee his undertaking; his income was the income of a Deputy Assistant District Attorney, and little more. Mr. Jerome's estimate of the expense to be incurred was at that time about four thousand dollars; the actual expense of his campaign was close upon thirty thousand, and there still remained a surplus in the treasury. Contributions poured in from all sides, and Mr. Gans spent the last days of the canvass in returning checks. Fred Stein, in Mr. Jerome's behalf, established a newspaper printed in Yiddish, the Hebrew jargon. Mr. Stein, the only son of a senior partner in one of the two foremost firms of woolen merchants in the United States, had passed his five years since leaving college in a journey round the world, in an apprenticeship of his own seeking among the humblest ranks of workmen in a woolen factory, and in achieving, by the dauntless execution of projects of his own device, the place of partner in his father's firm. He was more inexperienced in the details of politics, if possible, than Mr. Gans, and knew even less of Yiddish and of the management of newspapers than he knew of the details of politics. His activity in the campaign was a matter of pure accident; he had climbed the stairway leading to headquarters to pay the treasurer and Mr. Jerome a friendly visit; he was asked to receive the editors of certain Yiddish newspapers with whom Mr. Jerome had been in negotiation, and to find out what they wanted. They wanted money; they wanted to play Mr. Jerome's treasury off against that of Tammany; they stated with an unapologetic candor that they were men of business and that they had been offered so much by the other side. "Take it; take all you can get," Mr. Stein advised them; "we like to see Tammany waste its money. We've not a cent to bribe you with. But we've any amount to fight you with; and we will just establish a paper of our own and put you out of business." From that day until the end of the campaign Mr. Stein continued to receive visitors at headquarters; he became the *enfant terrible* of the establishment. Within a week after his rash promise he had got out, nominally for free distribution, though everywhere on the East Side the news-stands were selling it, an eight-page daily paper, partly in Yiddish, partly in English. The first issue was of fifty thousand, the second of seventy-five thousand, the later ones, eleven issues in all, of over a hundred thousand. For the distribution of these and of pamphlets, handbills, and what not, he organized a service of inspectors, men, and wagons, that at least once a day covered every section of the East Side. He has since established the newspaper, under the name of "The Jewish World," on a permanent basis. George Wilson Morgan had been attorney for the Committee of Fifteen, and in that capacity had followed with attention the career of Mr. Jerome. Mr. Morgan was just twenty-six. Meeting Mr. Gans in the street shortly after Mr. Jerome's nomination, he suggested that there ought, in mere decent precaution, to be organized a service of open-air speakers throughout the East Side, in Mr. Jerome's interest. Mr. Gans drew out a check-book, wrote a check to the order of George Wilson Morgan, Esq., and said: "Capital idea, Georgie. Don't protest; the finger of Providence points to *you*. When you have dropped the amount of that check, let loose the long yell, and more will be a-coming." Mr. Morgan saw the finger of Providence, and obeyed its indication. He opened an office at 91 Delancey Street, organized a staff of open-air speakers, and made a house to-house canvass covering the Fourth, Eighth, Tenth, Twelfth, and Sixteenth Districts, and so much of the Sixth District as lies east of the Bowery; these being the stronghold of Tammany. On election day the men who had been engaged in the house-to-house canvass brought to the polls the men whom they had visited and won over. It was the verdict of experienced politicians that no more telling and vigorous campaign was ever organized in the city of New York.

[TO BE CONTINUED]

The Best Side of Paris

By Carl S. Vrooman

IN Paris the "usual thing" is a half-day at the Louvre gaping at masterpieces of painting and sculpture; a half-hour at Napoleon's tomb; an hour at the Cathedral of Notre-Dame; a like prodigality of time at the gallery of the Luxembourg and other stock "sights"—then off the women go to the "Bon Marché" and rival establishments to revel in bargains, and the men to the cafés, the theaters, the boulevards, the "Quartier Latin," the "Moulin Rouge," and heaven knows where else, to acquire that polish which is warranted to transform a man into "a man of the world."

What a travesty of travel! What boundless possibilities of culture and enjoyment are thus blindly neglected! If the thousands who yearly go on pilgrimages across the water to their shrines of fashion, art, and indecency would but open their eyes to the myriad other interesting objects to be seen on every side, they would come back with mind and heart full, not of the ignorant, servile idolatry of foreign luxury and manners, but of suggestions for improving our own incomparable land.

The question in Paris is, What not to do? Her theatrical attractions are unrivaled and practically unlimited. While Sarah Bernhardt, Coquelin, Rejane, and Jane Hading can be seen in England, America, and in all the Continental capitals, only in Paris can be seen the incomparable "Théâtre Français" and the "Odéon," the two great national, government-supported theaters of France, where one can revel in the study of French literature, ancient and modern, as interpreted by the world's most finished actors and actresses. At the Français in each play every character, even to that of the meanest servant, is taken by one of the greatest artists of France. At the Odéon once a week, during the winter months, is given a "classical matinée," where the rendering of an old masterpiece is preceded by a critical lecture on the play and its author, by some professor from the Sorbonne or some world-known critic. In no other country in the world is the study of literature thus illumined and made delightful by the combined genius of lecturer and actor. And, finally, as a supplement to all this, one has at one's disposal delightful courses of lectures at the University on every phase and epoch of French literature. To the student of French life and social conditions the most unique and interesting theater in Paris, however, is the "Théâtre Antoine," the theatrical contribution and wonder of the nineteenth century. M. Antoine, the creator, manager, and star, or rather sun, of this theater, began life as an employee of a gas company. Without any previous training or experience, he started the "Free Theater," which he conducted according to his own original and unheard-of ideas. He was strongly realistic, sometimes brutally so. "Truth at whatever cost!" was his motto. He occasionally turned his back to the audience during whole acts. He simplified stage settings, entirely subordinating beauty and scenic effect to force and realism. He taught his own actors and actresses, many of them, like himself, never having had any previous professional training whatever. In addition to this he staged a class of plays never before seen in France—plays taken from Ibsen, Zola, Tolstoï, Tourguéneff, and plays of Hauptmann, Sudermann, and Björnson, and of modern French writers like Brieux, filled with the new sociological spirit of the age. Every one, except a handful of his personal friends, saw failure written all over the enterprise, but by the sheer force of genius he scored the greatest theatrical financial success of the age, absolutely revolutionized the methods and aims of the French theater, and made of it a powerful civilizing force in the community. He has given a vital impulse to modern serious sociological literature, and has brought powerfully before the minds and consciences of the great theater-going public the ideals which are molding the future of France.

The French theater, however, is but one of the manifestations of that all-pervasive æsthetic spirit which makes art the most prominent feature of French life. Her École des Beaux-Arts is certainly the

first among art schools. The Louvre, which gives courses of study specially designed to interpret the collection, public lectures of a more popular nature, and a four years' course for students preparing to fill positions as curators, librarians, and traveling collectors for museums, is the greatest single art gallery in the world. The Luxembourg is a superb museum of contemporary painting and sculpture, while the two Salons each spring give to the world the last year's product of the studios of Paris. Besides all this, there are numerous smaller galleries and public buildings, like the Pantheon, which are filled with some of the most splendid creations of the French artistic imagination. I was reared with a puritanic, Tolstoyan inclination to regard art as of the devil, as something effeminate and enervating. In the course of my political investigations, however, I ran across the fact that while American industries were competing successfully with the English and the German, they were making almost no headway at all in competition with the French. This is because in all French industry the artistic element is such a vital part. We cannot make the rare and beautiful creations they produce. Until we do, we can never compete with them in the markets of the world. When I thus learned that art is power, I began to respect it. I need hardly add that this respect, especially for applied art, is growing. Art should find its home, not only in public museums and galleries and in the drawing rooms of the rich, but in the factory, on the farm, and in the kitchen. Only as art permeates and beautifies all human products and all human life is it performing its true and splendid function. Art seems to be in the French bloo l—every shop-girl is a born milliner, and gets more artistic effect from an expenditure of a few cents than an American does at the cost of as many dollars. This characteristic is partly temperamental and partly the result of a systematic artistic education and development for generations. None of the great provincial towns is without its (to us) surprisingly rich art gallery and its own art school, together with a department or separate school of applied art.

The child in France learns to draw in the kindergarten before he learns to write. This training extends throughout entire school life. For the benefit apprentices and adults evening classe geometric and technical drawing, mach and architectural design, drawing fi flowers, casts, and the nude, and in mo ing and sculpture, are given in every w in Paris. There were eighty-nine of th evening schools in 1895. Higher stuc can be pursued in the Municipal Sch of Decorative Art Applied to Industry the National School of Decorative A The Government factories of Gobe tapestries and of Sèvres ware have sup art schools connected with them.

As a supplement to a personal inv tigation of this and other similar subjec I found the "Musée Social" an inva able institution. It was founded a heavily endowed by the Comte de Cha brun "for the purpose of supplying r able information concerning any insti tion which really succeeds in betteri the material or moral condition of t working classes." It is not a teachi body like the London School of Ec nomics, but students and writers a sent all over the world by it to ma researches on sociological subjects. monthly review is issued, as well as series of booklets embodying the resul of their labors. A series of popular le tures is given each winter in the hall the Musée, and a sociological library 16,000 volumes, with reading-rooms su plied with the leading newspapers an magazines of the world, is open free all. This is by no means an ideal inst tution. It is open to criticism for sin both of omission and of commission, bu it is a splendid effort. A more viril scholarly, and constructive institution o the sort will one day be established i our country, to boil down and popularize supplement and stimulate, the work of ou present Bureau of Labor Statistics. Whe all the other nations have followed sui another great step in the direction of civ ilization will have been taken, for state craft, at last, will be in a position to attai a condition of at least semi-intelligence A real science of politics will then b possible, international in its scope, schol arly in its methods, and noble in its ideals

Several of my most interesting evenings in Paris were passed attending lectures at what are known as the "Popular Uni

versities." Two of these lectures—one by Professor Charles Gide, the world-known economist, the other by Anatole France, the greatest living French man of letters—were the most fascinating I have ever heard. The French "conference" is a species of lecture which is absolutely unique in its artistic beauty, subtile humor, and sparkling wit. To my mind it is a higher form of art than the theater. This "popular university" movement is one of the most remarkable manifestations yet seen of the spirit of the twentieth century. It is at bottom a religious movement. Scientific French agnosticism is becoming constructive, is trying to develop a religion. It has discovered that the cold truth of science is powerless except as warmed into life by the flame of a passionate altruism—that the scientific spirit and the Christ spirit are fundamentally and eternally necessary each to the other. This movement has spread very rapidly, having a center in every ward in Paris and its environs, and not a few springing up on all sides in the provinces. It is a recognition by the "intellectuals," the brains of France, that unless they understand and are understood by the brawn and sinew of a nation, they are abnormal, impractical, and impotent. It is a recognition by the workingmen that intelligence, when not prostituted to plutocratic, aristocratic, or clerical influence, is their best friend and co-worker in the solution of the grinding problems of civilization. A solidarity of interests is seen to extend through all classes of society, except the predatory and parasitic ones. Philosophy, economics, literature, natural science, hygiene, music, art, are all taught to classes of grimy workingmen by the greatest professors, artists, and writers of France.

This movement, like much that is best in French life to-day, is the outcome of the Dreyfus affair. This moral crisis through which France passed, and passed successfully, has been of measureless value. The struggle was so intense, the excitement arose to such a white heat, that French thought and life were reduced to a state of chemical solution. When they recrystallized, new forms, new alignments, appeared, a transformation had been wrought. French politics furnishes one of the most striking examples of this. Before the "Affair" French political parties were a hopeless jumble of Progressivists, Radicals, Radical Socialists, Revolutionary Socialists, plain and uncompromising Socialists, Allemanists, Guesdists, Blanquists, Nationalists, Anti-Semites, Ralliés, Revisionists, Royalists, Bonapartists, Clericalists, and Independents. From this chaos have emerged two confederations of groups. On one side are found those who believe in defending the free institutions their fathers died to found, and who believe in still further progress. This includes most of the Socialists and Radicals as well as what we would call the Conservatives. On the other side are the Bonapartists and Royalists, who are trying to overthrow the Republic, the Clericalists, who are trying to overthrow religious freedom and non-sectarian education, and most of the millionaires, who blindly fight all progress on general principles.

I had the privilege of watching the first desperate battle between these rival hosts. It was the fiercest political contest that France has seen since the birth-throes of the present Republic. The reactionaries had an unlimited slush fund and bought every purchasable vote, prostituted every mercenary newspaper or magazine, enlisted the services of every unprincipled spell-binder, and yet were so thoroughly beaten that friends of progress all over the world lifted up their voices in thanksgiving. It was the most splendid victory for reform that the world has seen for several decades. The best campaign speeches I heard were by M. Labori, the brave defender of Dreyfus and editor of the "Grand Review," and by Jean Jaurès, the leader of the moderate, Parliamentary Socialists, editor of a Socialist daily paper, and the most eloquent man to-day in French political life. Before entering politics, he was a college professor. He is a perfect magnetic battery—rousing to a high pitch of enthusiasm, by sheer force of personality, a friend of mine who didn't understand a word of French, and fairly setting on fire his audience of twenty thousand Frenchmen. He crushes his opponents beneath an avalanche of facts, leads his auditors on to high and ever higher ideals by a series of word-pictures, touches the deepest chords of the human heart by the play of his poetic fancy around the fundamental problems of life and death, and then sounds

the wild charge of battle and fires his hearers with invincible devotion to the Cause by a sublime appeal to the passions of patriotism, self-interest, and family love. How I envied the French their clarified political atmosphere—the simplicity of the situation! It is probably too delightful to last, but it is certainly the commencement of a new and brighter epoch in French politics.

The Settlement Idea in Relation to Small Communities

By Lillian W. Betts

Author of "The Leaven in a Great City"

TO one familiar with the scores of resources for the protection of child life in large cities from suffering, degradation, and ignorance; with the constantly increasing effort to create and develop tastes for pleasures that add to the mental as well as the physical enjoyments of the children, the conditions controlling child life in small communities, especially the life of the poor children, are appalling.

Frequently this condition of neglect and indifference will be found where keen interest and practical help will express the sympathies of residents in the community for the limitations of life in the city tenements; money will be given by these people for city children with evident regret that it is money only that can be given, and quite as evident envy for the city workers' opportunity "for doing good," while the children right at their doors are in a condition of neglect impossible in New York, for instance.

In a town not a hundred miles from New York there is a progressive and progressing manufacturing interest which has evolved and invited a small army of skilled and unskilled workingmen who are positive political factors in the town. Their homes are centered in three sections. Sons, leaving farming, have built on old farms small houses with the most primitive sanitary arrangements; making a nucleus for an aggregation of similar houses until the farm lands in the town limits adjacent to the roads are bordered with these houses. Houses near the river abandoned by former residents have become tenements; thrifty workmen have erected two-story houses and sublet, though the plan of the house is for one family. These are crowded together, with the bit of land at the back monopolized as a vegetable garden, crowding the children on the road for play space. The roads and sidewalks in these sections of the town are uncared for, being mere openings between rows of houses. A third section is crowded; the houses tumbling about the occupants, leaders from the roof broken, stoops falling, gates broken or gone, fences slowly disappearing as firewood. Here, too, the road is the children's only playground. The very trees in these neighborhoods look diseased and unthrifty. On one clear, bright day in August there were counted on one street of this town forty-three dirty, ragged, barefooted, quarrelsome children. Hanging over broken fences, leaning against uncertain gateposts, sauntering along the roadway, hanging out of windows, or nursing babies on stoops, were women of every age, who in appearance matched these children. A pump at the corner seemed to be a general meeting-place for the women, who stood in idle groups, as untidy, unwholesome specimens of American womanhood, the writer firmly believes, as could be found in the whole country. The climax was a girl of between eleven and twelve, clad in one garment, a dress having only one button on the waist and this at the back of the neck. When she remembered, she held the dress together at the waist line by keeping her hand at the back. Her face was hard, old, and repellent. She stood with a tin pail listening to the excited gossip of the women, not one of whom paid any attention to her disgracefully naked condition, or tried by the use of a pin to make the child more respectable. It would have been impossible for

that child to have remained on the streets of New York in that condition for ten minutes. Law or love would have protected her. Three days later this same child, with the accumulation of three days' more dirt on body and clothes, stood at the pump in the same condition of partial nakedness. Yet from any hill-top in the region surrounding this town the spires and towers of Christian churches call attention to their profession.

Glimpses into the houses in this poor section showed as much crowding and as little in the way of conveniences for housekeeping as a tenement-house in New York would show.

The evening reveals half-grown boys and girls lounging about the streets with manners and language that differ in no degree from those of boys and girls given the same freedom in New York, except that their conversation lacks the wit and amusing comment of city boys and girls.

The town has churches of all the orthodox denominations, well attended and fairly well supported. Each has a parsonage. The usual church organizations are in each congregation. The town has at least one women's club; yet the only non-sectarian effort in the interest of civilization is the public school, and even that is the battledore and shuttlecock of the town politicians. There is no library or reading-room; no boys' or girls' clubs; not even a village improvement association.

A man perfectly familiar with the social conditions of the churches and town explained the situation by saying that there were three classes of aristocrats in the town: the city residents who summered there, and neither knew nor cared anything about the poor of the town; the people who descended from Revolutionary ancestors and refused to affiliate with other people; and the class who had made money and now spent all their energy in trying to scale the exclusive walls of the Revolutionary human relics. These would never take the initiative in any movement lest they should strengthen the walls against which they make constant assaults. Further thought and investigation revealed a fourth cause for the neglect, physical and mental, of the town: denominational jealousy, the absolute impossibility of uniting the people of all denominations for a common good. This, it is positive, was the fundamental disuniting cause in this community, is the fundamental disuniting cause in every community where there is no common community interest. When this is admittedly the cause, the people deplore it hopelessly, as though there were no remedy.

The difficult thing for people unused to the conditions of city life to grasp is that every effort for the betterment of physical conditions in the city outside of the church should mean the uniting of men and women of every denomination. Every social settlement is a positive, direct effort to create better inner and outer conditions for every human being entering its doors, while rigidly excluding everything that would approach denominational religion. Nothing, perhaps, better exhibits this care than an incident that occurred in the early days of the College Settlement. A Mother Goose entertainment was to be given by the children; one small person took the character of

> Mary, Mary, quite contrary,
> How does your garden grow?
> Silver bells and cockle shells,
> And pretty maids all in a row.

The child evidently recited this at home. One morning, in a state of excitement bordering on hysteria, the Hebrew mother appeared and protested: the child was being taught to worship the Virgin Mary! No argument was used to change her view. It was not the wise way to use strength. The character was dropped from the entertainment, for that one mother was representative. The day has come when illustrated lectures on the life of Christ can be given in that very room without protest, because care is taken to avoid the presentation of Christ as the founder of a creed.

Every social settlement gathers to it people of all and every creed, as well as no creed; it represents in its work a small community. Slowly but surely it draws to it and holds the most receptive and retentive minds in that community; these become its unconscious missionaries, bearing the light into homes that no one else could reach.

Is it impossible for the churches in small communities, no one of which, even if it were wise, could establish a work on non-sectarian lines, to combine for the betterment of the community life?

Where is charity organization more

needed than in a small community? Each church, regardless of the other, doles out charity, too frequently with only superficial knowledge of the conditions' surrounding the recipient, and with a density often incomprehensible to the observer as to the causes that made the giving of charity necessary.

The child life of the poor may reveal a steady deterioration, deplored and acknowledged—indeed, this seems a favorite topic in the weekly church meetings—yet no unselfish, undenominational effort is made to change the conditions that are bringing the degrading results.

A Connecticut town recently became the residence of an energetic worker among the poor. The members of the several churches stood aloof from one another even in their social life. No effort was made to add anything to the life of the poor, who were segregated as is usual in towns. The new resident called a meeting of the women of all the churches at her own house. Her invitations were generally accepted. She proposed starting a sewing-school for Saturday morning, announcing that she had secured the use of a certain Sunday-school room because it had the best light of any in town. Of course there was a perceptible loss of interest, but two weeks later women representing every denomination in the town were acting as teachers in the sewing-school. This unity of interest revealed charms in each unknown to the others, though many of the workers were born in the town and had never lived anywhere else.

The pastor of one of the churches called on every member of his church working in the sewing-school and protested vigorously against her attendance—*because it took her interest from her own church.* As her own church held one week-day meeting, which only the saintly could endure, and a preaching service which it required more grace to attend than is required to face the dominant domestic problem, to at least one sufferer from his call arose the question as to where her own church justified her interest or activity.

Is it the pulpit and not the pews that is responsible for the conditions that make for evil in small communities?

Where in the city can be found more trading of votes, more sharp practice in elections, less interest in local affairs, than in those communities where denominationalism has displaced the teachings of Christ? One repeats, when passing these churches, the lines of the poet:

> . . . When we faced the church
> With spire and sad slate roof, aloof
> From human fellowship so far,
> Where a few graveyard crosses are,
> And garlands for the swallows' perch.

For the people seem unlearned in human interests, seemingly do not believe that the way of life is the road to eternal salvation. Have they forgotten that the every-day life was Christ's opportunity to impart the power of living righteously?

Centers that bring all the people together, that create common interests, form a bank of knowledge where heads and hearts work together to lessen suffering, to stimulate hope, and to arouse interest in each one who makes a demand on its capital. This capital is sustained by the whole community to raise its civilization, to afford educational opportunities unhindered by denominational thought, and to supplement what is provided by taxation, for all who will accept. These are the opportunities of every church in a community which has social problems due to poverty and overcrowding, and the absence of social life to lighten the burden of labor.

No surer method of reaching the unchurched exists than that of undenominational effort for the community's good. And work for the children, as if to prove the truth of prophecy, "A little child shall lead them," wins the best that the best men and women have to give.

Let the effort begin with work requiring personal service from those who have skill and knowledge. Slowly the barriers between the churches will melt away; needs and opportunities will not be separated by a name. There will come finally a community of interest representing the brotherhood which Christ's life epitomized for man's guidance in his life with his fellow-men.

Labor's Critics

By Annie C. Muirhead

[Last summer (June 21) we reprinted in these columns a clever satire entitled "The Walking Delegate," because it put so effectively the sentiments of the critics of the labor unions. The following lines called forth by the miners' strike testimony and the current discussion express with similar satire the sentiments of the labor world toward its critics.—THE EDITORS.]

"I believe in labor unions," said the College President,
"But I think I could improve upon their rules.
If with what the masters chose to give, the members were content;
If they handed the non-unionist their tools,
And patted him, like brothers, where his backbone ought to be,
And said, 'Pray take our job for what you'll get,
For our rights are non-conflicting in this country of the free—
We're just as free to starve as you to sweat!'
If they strained their every nerve to turn out piece-work by the heap,
Till the masters in alarm cut down the rate;
If they welcomed-in apprentices to do work on the cheap—
Why, then I think trades unions would be *great!*
With these few and slight restrictions, which are well and wisely meant,
I approve of labor unions!" said the College President.

"I believe in labor unions," said the Bishop to his flock,
"Provided that they do not go too far:
For the violence that boycotts and does injury to stock
Is only fair in *military* war.
Let nation threaten nation (if the last's of smaller size)!
Let them righteously maraud and murder too!
But unionists should never let their angry passions rise,
For that is such a naughty thing to do!
They should strike in white kid gloves and patent-leather dancing-shoes,
And take little mincing steps to gain their ends.
If they'll behave like gentlemen, of course I'll not refuse
To be among the stanchest of their friends.
If there's nothing in their actions that our Christian nerves will shock,
I approve of labor unions," said the Bishop to his flock.

"We believe in labor unions," say the Editors of tact,
Provided they are always nice and good:
For the workingman's an angel; like an angel he must act,
And not like ordinary flesh-and-blood.
Although his sick wife freeze, he must be silent as a clam,—
Strong words, of course, would never be polite:
He must bear the worst injustice with the meekness of a lamb,
That so he may be always in the right.
If the widow's mite be grabbed from her, she must not make a fuss,
For that is hardly ladylike, you know!
She must show an equanimity such as you see in us,
As cheerfully we bear our neighbor's woe!
If they *never* make mistakes, and will *always* take a hint,
We approve of labor unions," say the Editors in print.

If the President had logic, and the Bishop had more sense,
And the Editors' remarks were never trite,

They might help to solve the problem as to how, in self-defense,
The workers' labor unions ought to fight.
Still, they are but fellow-mortals, and no doubt they've done their best.
I approve of College Presidents, and Bishops, and the rest!

The Economic Interpretation of History[1]

LIKE everything Professor Seligman writes, this book is profoundly scholarly, but it is not overloaded—as some of his later books have been—with the history of the literature of the subject. The really creative part borne by Karl Marx in the development of the theory Professor Seligman defends is reached in two or three chapters, and the rest of the book is devoted to the elaborations which the Marxian theory has received and the limitations that must be put upon it to make it, in Professor Seligman's view, thoroughly tenable. These limitations are not so destructive of the core of Marx's theory as we anticipated, for Professor Seligman frankly enrolls himself as one of Marx's disciples so far as this feature of his philosophy. Professor Seligman does not make the economic motive the one essential factor in the shaping of human history, but he does maintain that up to the present time the national struggles, the class struggles, and the individual struggles of men have been "in last resort all due to the pressure of life upon the means of subsistence," and that "so long as this conflict endures, the primary explanation of human life must continue to be the economic explanation—the explanation of the adjustment of material resources to human desires." "This adjustment," he continues, "may be modified by æsthetic, religious, and moral, in short, by intellectual and spiritual, forces, but in last resort it still remains an adjustment of life to the wherewithal of life."

That this theory is in its essence materialistic Professor Seligman admits as frankly as he admits his Marxian discipleship. With the limitations which he puts upon it, it is, of course, far less materialistic than as first formulated by Marx, but none the less the distinctive quality of theory remains the same. We agree thoroughly with Professor Seligman when he maintains that Marx's economic interpretation of history is a theory entirely separable from his socialistic philosophy, and we agree entirely with him when he maintains that this interpretation of history has aided powerfully in revivifying historical writing, and is yet to aid in making the conflicts of the past as real to us as the conflicts of the present. But, to our minds, the distinctively materialistic kernel of Marx's philosophy is as untrue as its distinctively socialistic kernel. The latter—the theory of surplus value—the leading Social Democrats of Germany are now consciously rejecting; and the former—the perpetual predominance of the economic motive—they have unconsciously repudiated from the first. Marx's own life was a constant denial of it, for if the economic motive had been the dominant one in shaping it, he would have devoted his superb talents to the service of those who had gold to give, instead of devoting them to the service of those who could only give him their hearts. All of the great revolutionary movements which have carried mankind forward have had a similar motive back of them. In our own history the pivotal events—the sailing of the Pilgrims, the Declaration of Independence, and the emancipation of the slaves—were all in flagrant defiance of the economic motive alleged to be dominant. It is only the forces resisting these great movements which have been primarily economic and materialistic. The true economic interpretation of history is not that which finds a materialistic motive for the upward struggles of mankind, but that which finds in the history of nations as of individuals the perpetual conflict between the moral forces and the material, and which reveals that only through the subordination of material ends to moral ends has humanity advanced.

[1] *The Economic Interpretation of History.* By Edwin R. H. [illegible] fessor of Political Economy and Fin[illegible] iversity, New York. The Mac-[illegible]

Imperialism[1]

THESE three books deal with the policy of expansion from very different points of view. The first regards it as a crime; the second as a historic necessity; the third accepts it and undertakes to show how it can best be carried on.

The title of Mr. Hobson's book is a misnomer: it should be called, not "a study," but "an indictment." That policy of expansion which for Great Britain might be said to date from the bombardment of Alexandria, and for the United States with the war against Spain—for previous expansions of both countries are not dubbed by the critics Imperialism—Mr. Hobson regards as evil and only evil and that continually. There is for it no justification, apology, or excuse. It hardly deserves a hearing. He is a gentleman, and therefore does not berate it as Judge Jeffreys did the Puritans; but his temper toward it is hardly more judicial than that of Judge Jeffreys toward Puritanism. His mental attitude regarding it is pretty much that of the abolitionists regarding slavery, the prohibitionists regarding the saloon, and the Boston anti-imperialists regarding the policy of Presidents McKinley and Roosevelt. The Anglo-Saxon world appears to him to have gone crazy; to be violating its own principles, its own interests, and the rights of its weaker and poorer neighbors. The inspiration of this policy he thinks is thoroughly bad: "The controlling and directing agent of the whole process, as we have seen, is the pressure of financial and industrial motives, operated for the direct, short-range, material interests of small, able, and well-organized groups in a nation." Denying liberty abroad, it has destroyed liberty at home. "In England it [the Liberal party] now stands convicted of a gross, palpable betrayal of the first conditions of liberty; feebly fumbling after programmes as a substitute for principles. Its leaders, having sold their party to a confederacy of stock-gamblers and sentimentalists, find themselves impotent to defend Free Trade, Free Press, Free Schools, Free Speech, or any of the rudiments of ancient Liberalism." He concedes that there are some well-meaning souls who believe that the expansion of the Anglo-Saxon race will make for the material betterment and moral and intellectual development of the more backward races. But these "sentimentalists" deceive both themselves and others by "masked words." This is "not hypocrisy; a consciousness of inconsistency would spoil the play: it is a condition of the success of this conduct that it should be unconscious." Nevertheless, the policy of expansion is nothing more than pulling other people's chestnuts out of the fire; and every one engaged in the operation is either an ape or a cat.

We think it a pity that Mr. Hobson had not written a "study" instead of writing an indictment. For he is an able man; he has studied his subject; he is master of a clear, terse, and vigorous English; and if he had set out to persuade his fellow-citizens, instead of setting out to convict them of criminal folly, he might have rendered a very useful service. America certainly, and we think England also, needs a book which will set forth clearly in rational form, free from passion and heat, the objections to and the difficulties in the way of the course of that public policy on which England and the United States have entered. But this is not the book that Mr. Hobson has written. His introduction warns away from his pages all who have believed or acquiesced in that policy. None of us like to read a denunciation that we are either fools or knaves; the most open-minded men are not open to that conclusion. Mr. Hobson's book will be read with delight by the anti-imperialists; but they do not need it; and we fear it will be read by few others. It will hardly be persuasive even to those who are as yet doubtful whether to give their influence in favor of the extension of the flag of their country over new lands or to urge its withdrawal over some where it has recently been planted; because the very vehemence of Mr. Hobson's assurance,

[1] *Imperialism: A Study.* By J. A. Hobson. James Pott & Co., New York.
The New Empire. By Brooks Adams. The Macmillan Company, New York.
The Administration of Dependencies. By Alpheus H. Snow. G. P. Putnam's Sons, New York.

and the entire inadequacy of his attempted explanation of this new phase in the life of civilized nations, especially of Great Britain and America, will awaken in their mind the shrewd suspicion that there are some other grounds for that movement, more worthy of serious consideration, than any which Mr. Hobson has discovered and refuted in the two chapters on "The Scientific Defense of Imperialism" and "Moral and Sentimental Factors," and some other alternative than that which Mr. Hobson apparently alone recognizes, "the elimination or subjugation of the inefficient" by the more civilized races, or leaving them alone in the conditions of their present hopeless barbarism. That there is such an alternative, that both England and America are on the track of it, The Outlook thoroughly believes; Mr. Hobson even seems in one or two places dimly to recognize this alternative in his suggestion of a world-federation. What this is both President McKinley and President Roosevelt have in their Messages indicated; The Outlook has in past issues suggested; and to it we shall doubtless recur in future issues of The Outlook when discussing the expansion policy of the United States.

"The New Empire" is in its tone a radically different book. It is purely scientific, a critic might say academic. The author is passionless. He treats the new phase of development in American life as an electrician might treat a new development in electricity. His conclusion illustrates this spirit: "If the new Empire should develop, it must be an enormous complex mass, to be administered only by means of a cheap, elastic, and simple machinery; an old and clumsy mechanism must sooner or later collapse, and in sinking may involve a civilization." That Americans have anything to say on the question whether this new Empire shall develop or not Mr. Adams hardly concedes; he treats it as the inevitable result of resistless forces. The theme of his book it is not easy to state in a sentence; essaying this difficult task, we should define it thus: The progress of empire is determined by economic considerations; these are determined by geographical conditions; as the market center of the world has changed, empire has changed; it has thus traveled westward from Babylon to Greece, from Greece to Rome, from Rome to Western Europe, to England, and now at last to America. The Empire is ours whether we like it or not. We have not created it; we cannot prevent it; we can only choose whether we shall maintain and administer it wisely or bungle and destroy it. From Mr. Brooks's point of view, the alternative on which Mr. Hobson dwells with such passionate earnestness has no existence. We *must* accept the charge; we may administer it either well or ill: that is our only alternative.

We think that Mr. Brooks's point of view is more accurate than Mr. Hobson's, and yet we are not able wholly to accept it. We think that human choice enters more into the making of human destiny than Mr. Brooks apparently thinks it does, and we think that many motives enter into the determination of human destiny besides the commercial motives. Men fight for the right to live; they fight for commercial supremacy; they fight for greed, pure and simple; but they also fight inspired by other motives: by the love of power; by the passion for more territory apart from what it brings with it of real or fancied advantage; by the love of glory; by the pleasure of subduing other men, as they hunt for the pleasure of subduing wild animals; by the mere half-human, half-brutal love of fighting. All these elements have entered into the making of empires in the past, and probably still enter into the making of them. We think, too, he makes too little of German energy and English persistence. To say that "inertia pervades all English society" is to generalize too broadly. The historical survey which occupies the first five chapters of his book lacks architectural proportions. It is too elaborated at points readily to carry the reader forward to his conclusion. On the other hand, the last chapter, in which he reaches the conclusion that the scepter of industrial empire has passed from England to the United States, is too scantily wrought out to carry conviction except to one altogether predisposed to accept it. Nevertheless, the book appears to us a real and valuable contribution to the student's knowledge of the general subject, and well worthy his careful reading and consideration. If it presents but one and that a purely economic view, it presents it with

ibility, and the view is of the first importance to any correct understanding of the subject.

In characterizing Mr. Snow's volume on "The Administration of Dependencies" we cannot do better than quote his subtitle: "A study of the evolution of the Federal Empire, with special reference to American colonial problems." The book is by a student and for students. It is judicial and scientific in tone, and is devoted exclusively to stating what has been and is; only in the last chapter does the author consider what ought to be. Only by implication can the reader draw any conclusion from the preceding chapters as to the author's judgment on the latter question. He traces the growth of what its opponents call "imperialism"—and so little does Mr. Snow object to the use of this word that he speaks throughout his work of the Federal Empire, declares that "the Constitution of the United States and the Constitution of the American Empire are not and cannot be one and the same thing," and devotes an entire chapter to a consideration of the "Imperial Obligations" of the American people. He shows that the distinction between States and Territories of which the United States are composed, and territory *belonging* to the United States but not a component part of it, is not a new distinction invented in the last decade, but has grown up from the earliest colonial days. We can here give but a few quotations as samples of the way in which this doctrine has been asserted continuously and from a very early time. It was recognized by the founders of the Constitution and prior to its adoption. Thus: In 1781 Maryland, by its Legislature, presenting a protest against the conditional cession of territory by Virginia, said, "The United States have succeeded to the Sovereignty over the Western territory, and are thereby vested, as one undivided and independent nation, with all and every power and right exercised by the King of Great Britain over the said territory." In 1803 Gouverneur Morris wrote, "I always thought that when we should acquire Canada and Louisiana it would be proper to govern them as provinces and allow them no voice in our councils," and that in the wording of the Constitution he had this principle in mind. This distinction between territories *of* the United States and territory *subject* to the United States has often been explicitly recognized by Federal law. Two illustrations may suffice: Thus in 1804 a Federal statute respecting the National Bank provided that "the President and Directors of the Bank of the United States shall be and they are hereby authorized to establish offices of discount in any part of the territories or *dependencies* of the United States; and again, in the same year, in another law embodied the phrase, "The public acts . . . of the respective territories of the United States and *countries subject to the jurisdiction of the United States.*" The same doctrine has been very explicitly and repeatedly affirmed by the Supreme Court of the United States. Thus in 1828 Chief Justice Marshall, speaking for the Supreme Court, declared of Florida that it is "a Territory of the United States, governed by virtue of that clause in the Constitution which empowers Congress 'to make all needful rules and regulations respecting the territory or other property belonging to the United States;'" in 1879 the Supreme Court, by Chief Justice Waite, declared of the Territories that "their relation to the General Government is much the same as that which counties bear to the respective States, and Congress may legislate for them as a State does for its municipal organizations;" in 1884, by Mr. Justice Matthews, the Supreme Court declared that "the people of the United States, as sovereign owners of the National Territories, have *supreme power over them* and their inhabitants," so that "it rests with Congress to say whether, in a particular case, any of the people resident in the Territory shall participate in the election of its officers or the making of its laws; and it may therefore take from them any right of suffrage it may previously have conferred, or at any time modify or abridge it, as it may deem expedient;" and, finally, in 1889 the Supreme Court, speaking by Mr. Justice Bradley, and subsequently by Mr. Justice Harlan, respecting the limitations imposed on this supreme power of Congress, declared that "doubtless Congress, in legislating for the Territories, would be subject to those fundamental limitations in favor of personal rights which are

formulated in the Constitution and its amendments; but these limitations would exist rather by inference and the general spirit of the Constitution from which Congress derives all its powers than by any express and due application of its provisions." This is only saying in a less terse fashion what John Dickinson had said in 1774: "That States without freedom should by principle grow out of a free State, is as impossible as that sparrows should be produced from the eggs of an eagle."

We have not space here to trace out the historical process by which Mr. Snow reaches his secondary but equally important conclusion, "that the President should be the representative of the American Union in the habitual and constant performance of its Imperial obligations, and that the Congress should represent the Union in the performance of these same obligations as the superintendent of the President." It must suffice to say that Mr. Snow makes it clear that such a method of administration, by executive order rather than by Congressional enactment, is in accordance not only with modern tendency but with historic precedent, and that the attempt to transfer the fulfillment of National obligations toward dependencies from the executive to the legislative department of the Government has not worked well. This is not to impair the powers or functions of Congress. "The placing of the immediate and daily charge of the administration of the affairs of the dependencies in the hands of the President advised by a Council of experts would still leave a most important field of operation for the Congress. It would not only superintend and control the action of the President, bu would determine for the Union and th Empire all the great questions of Nationa and Imperial policy, and would give th final ratification to those great Imperia dispositions or settlements, by which th forms of government in the dependencie are established or amended, and by whicl the dependencies are federated or unite as their local interests may dictate."

Thus Mr. Snow, as the result of a care ful historical survey, reaches the conclu sion that the development of the Republi from its earliest colonial days has resulte in establishing, by two centuries of ex perience, two doctrines: first, that th United States may own territory, and ove such territory as it does own it is unde obligation to exercise all the functions o sovereignty, responsible only to its own National conscience and to the public judgment of mankind; second, that in the exercise of this sovereignty it is for the interest alike of the Republic and of the dependencies that all details of administration should be left to the executive department, and that the legislative department should confine itself to general superintendence and the determination of the broad general principles by which the administration of the dependencies should be governed. These two principles constitute what their critics call "Imperialism." Mr. Snow has shown conclusively that they are not a modern invention, created by a commercial spirit, in order to exploit helpless peoples, but are the product of at least two centuries of the development of free institutions, and are supported by whatever presumptions there are in favor of the natural and unconscious growth of the Republic.

The Founder of Mormonism[1]

THERE are two views of the origin of Mormonism. One, commonly held by the opponents of the cult, is that Sidney Rigdon, a follower of Alexander Campbell and a minister of the "Disciples," was the real writer of the Book of Mormon and the chief personal force behind the extraordinary sect. This is the view accepted by Mr. Linn in his impartial work, "The Story of the Mormons." The other view is that Rigdon had little to do with the origin of the movement, but that Mormonism is chiefly a product of the mind of Joseph Smith. This is the view of Mr. Riley in the volume on "The Founder of Mormonism." The former view, in spite of its difficulties, has been more widely accepted than

[1] *The Founder of Mormonism: a Psychological Study of Joseph Smith, Jr.* By J. W. Riley. Dodd, Mead & Co., New York.

the latter, because Rigdon was a man of far higher attainments than Smith and far more capable, therefore, of the literary work involved, crude as it was. Mr. Riley, while acknowledging practically all that has been said as to Smith's ignorance, affirms that there are psychological forces which can account for the production of Mormonism by a mind which, though uneducated, was highly imaginative and abnormally active. His book is really an essay in support of this thesis. He makes out a very interesting case, and in some particulars presents a very strong argument. This is especially true in his description of the early life of "Joe" Smith and his environment. Upon a religious dreamer, whose visions and hallucinations were an exhibition of a family trait, the effect of warring and disputatious doctrinal sects must have been exciting, and the effect is capitally and graphically traced in this book. Psychological explanations are also given of Smith's "translations" and "revelations," his exorcisms and his faith-healing. Though this account of morbid self-deception mingled with uncontrolled though largely genuine religious emotion is depressing, it also has that element of grotesqueness that makes it fascinating. Moreover, it shows in a vivid way how powerful the religious impulse is—none the less powerful when directed by ignorance and literalism. In comparison with Linn's "Story of the Mormons," this book is less broadly historical, more pictorial, and more successful in giving an intimate, personal view of Mormonism. It serves, therefore, as an admirable supplement to the larger work, besides having independent value. Together these two books are instructive with regard not only to Mormonism, but also to the many religious movements in America which, based on some form of Scriptural interpretation, are characterized by visions, faith-healing, and other alleged occult phenomena.

Books of the Week

This report of current literature is supplemented by fuller reviews of such books as in the judgment of the editors are of special importance to our readers. Any of these books will be sent by the publishers of The Outlook, postpaid, to any address on receipt of the published price, with postage added when the price is marked "net."

A B C of Banks and Banking (The). Vol. IV. (Nelson's Wall Street Library.) By S. A. Nelson, New York. Published by the Author, 16 Park Place, New York. 5×7 in. 232 pages. $1.50.

Advanced Algebra for Colleges and Schools. By William J. Milne, Ph.D., LL.D. The American Book Co., New York. 5¼×8 in. 608 pages. $1.50.

Air Voyager (The). By W. E. Ingersoll. The Gorham Press, Boston. 4×5¼ in.

Ancient Athens. By Ernest Arthur Gardner. Illustrated. The Macmillan Co., New York. 6×9¼ in. 579 pages. $5, net.

There are two Professors Gardner, brothers, who have attained deserved fame as Greek scholars—Professor Percy Gardner, of Oxford, and the author of the present volume, who occupies the Chair of Archæology in the London University College. In his admirable "Handbook of Greek Sculpture" Professor Ernest Gardner taught us what to expect in succeeding books from him; and "Ancient Athens" abundantly bears out such expectation. Clearly and directly the author gives to us in this volume the impressions on a scholar produced by the sites and buildings of Athens, as viewed in the light of the references made to them by classical writers. As Professor Ernest Gardner was for some time the Director of the British School of Archæology at Athens, he writes of the late excavations and discoveries with first-hand, personal knowledge. The well-printed volume is lavishly illustrated with photogravures and half-tones, and is provided with a number of plans. In every way it is to be commended to the student of archæology, to the lover of Greek literature, to the ordinary tourist, and to the general reader.

Bears of Blue River (The). By Charles Major. Illustrated. The Macmillan Co., New York. 5×7½ in. 277 pages. $1.50.

A new edition of a series of bear stories by the author of "When Knighthood was in Flower," in which there is an almost illimitable supply of boys and bears.

Boston Days: I. The City of Beautiful Ideals. II. Concord, and Its Famous Authors. III. The Golden Age of Genius. IV. The Dawn of the Twentieth Century. By Lillian Whiting. Illustrated. Little, Brown & Co., Boston. 5×8 in. 485 pages.

Miss Whiting's latest volume is an enthusiastic but not wholly unfounded glorification of Boston, its ideals, history, type of character, men of letters, traditions, women, atmosphere. She describes it as the city of beautiful ideals; and her chapters, taken by themselves, would justify that characterization of Boston. They are full of luminous examples of high character, high thinking, and fine acting. She has made a kind of golden rosary of the great men and women of Boston. The country, which owes much to them, not only for what they said and the way in which they said it,

but for what they were and the way in which they lived, will not be disposed to subtract from the sum total of their merits and their achievements. The record would have been more convincing to persons of a worldly mind if it had been less enthusiastic. But Miss Whiting is a lover of beautiful things, a believer in them and a recorder of them; and in this book, as in "The World Beautiful," her emphasis rests on the things which are honest and pure and of good report. She has collected a great deal of information; and while her book is not an original contribution to the history of Boston, it is an interpretation of that story on its highest levels of achievement.

Camp Fires in the Wilderness: Valuable Information for Campers and Sportsmen. Illustrated. By E. W. Burt. National Sportsman Press, Boston. 5½×7½ in. 164 pages.

Christian Science: A Comedy in Four Acts. By M. M. Mangasarian. Published by the Author, Chicago. 4½×7½ in. 78 pages.

Dancers and Other Legends and Lyrics (The). By Edith M. Thomas. Richard G. Badger, Boston. 5×7¾ in. 93 pages. $1.50.

Daniel Webster. By John Bach McMaster. Illustrated. The Century Co., New York. 5½×8½ in. 343 pages. $2, net. (Postage, 16c.)

A beautifully illustrated life of Webster, popular in style as the name of its author assured, and reaching in its final pathetic chapter on the Seventh of March speech an unwontedly high level of historical writing. Indeed, this chapter has genuine dramatic power. The whole narrative is interesting, and the illustrations which accompany it have been chosen with judgment and reproduced with rare skill and effectiveness.

Discords. By Anna Alice Chapin. The Pelham Press, 9 West Thirty-ninth Street, New York. 5×7½ in. 208 pages. $1.50.

Death of Christ, The: Its Place and Interpretation in the New Testament. By James Denney, D.D. A. C. Armstrong & Son, New York. 5×8 in. 334 pages.

The chief and fundamental defect in this book, it seems to us, is the assumption that there was in the minds of the New Testament writers, and in the mind of Jesus himself, a common system of belief, and that this system was the source of their power. "The doctrine of the death of Christ and its significance," says the author, "was not St. Paul's theology. It was his gospel. It was all he had to preach." Religion is accordingly an interpretation, not primarily an experience. The logical conclusion is that a person can be a Christian only as he understands this interpretation and accepts it as his own. As a matter of fact, this has been disproved myriads of times by the lives of those who would be utterly perplexed if asked to give their system of belief. Although this book uses the results of modern research, it represents a type of book that the historical spirit has made antiquated; it uses modern apparatus to construct an obsolete machine. And yet it would be very unjust to give the impression that the theology of the book is itself mechanical. The reader receives the impression of a mind that is marked by wholesome Scotch sturdiness, and, thou never acrid, is sometimes sharp.

Essentials in Ancient History (From the E est Records to Charlemagne). By Arthur M. Wolfson, Ph.D., and Albert Bushnell Hart, LL Illustrated. The American Book Co., New Y 5¼×8 in. 528 pages. $1.50.

Fifty Mastersongs. By Twenty Compos Edited by Henry T. Finck. Oliver Ditson Boston. 9×12½ in. 186 pages. Paper bound. $

This collection, or more accurately selecti of songs is unquestionably the most adequ that has ever been prepared. Schubert course, is represented by the largest num of songs—eight. To some it will be surp ing that Grieg shares with Franz the pl of second importance, each contributing songs. This, we think, is an indication Mr. Finck's personal taste rather than editorial judgment; but if any man's ta has authority, Mr. Finck's ought to have this department of music. This fact, howev hardly makes it necessary for him to insist his introduction quite so strongly upon own expertness. Chopin is conspicuous his presence among the Twenty with two his songs! Mendelssohn and the Italian so writers are conspicuous by their absen MacDowell contributes the one Americ song; the editor, however, says that m would have appeared except for copyright d ficulties. The editor's brief comments each composer and song are readable a generally judicial. Altogether, "Fifty Mast songs" succeeds in its purpose to provid touchstone by which the genuine in song m be distinguished from the worthless.

Forty Piano Compositions by Frédé Chopin. Edited by James Huneker. (The M cians' Library.) Oliver Ditson Co., Boston. 9×1 in. 184 pages. In cloth, $2.50.

Mr. Huneker's selection of Chopin's pia compositions has been made with admiral skill. It is designed especially for amateu Especial mention should be made of M Huneker's exceedingly able and clever intr duction. His reputation for clear, vivid, a readable style is well sustained in these co ments upon Chopin and the works included this volume. The publishers' work in t series to which this volume belongs deserv commendation. The Musicians' Libra should attain high rank among what may termed, if the phrase is allowable, music anthologies.

Introduction to Botany. By William Cha Stevens. Illustrated. D. C. Heath & Co., Bost 5×7½ in. 127 pages.

Jim and Joe. By Edward S. Ellis. Hen T. Coates & Co., Philadelphia. 5×7¾ in. 450 pag 80c., net.

Life and Career of James William Hott, D.D LL.D. By Marion R. Drury, D.D. The Unit Brethren Publishing House, Dayton, Ohio. 5¼ in. 214 pages. $1, net.

Life and Correspondence of Henry Inger Bowditch. By his Son Vincent Y. Bowditch. 2 vols. Illustrated. Houghton, Mifflin & Co., B ton. 6×9 in. Per set, $5, net.

The memorials of the dead which are mo inspiring for the living include those of th path-breakers, the leaders of progress, and those who volunteer for the forlorn hope

the beginning of reform. In this class is the present work. Dr. Bowditch's father, Nathaniel, gained National fame as a mathematician; he himself, as a physician, by his promotion of "preventive medicine," particularly in combating consumption. For this he was made chairman of the State Board of Health in Massachusetts when instituted in 1869, and a member of the National Board of Health when instituted in 1879. He deserves remembrance for his early advocacy of the unpopular proposition to open the medical profession to women. It was in the early time of the anti-slavery movement that his chivalrous character was most conspicuously exhibited from the day when the mob of respectable Bostonians endeavored to lynch Garrison, in 1835. Thenceforth he staked his social standing, his professional prospects, in courageous struggle for the right of free protest against slavery and for the emancipation of the enslaved. The story of the part he bore in the days when Federal troops were employed in Boston to enforce an unpopular Federal statute, as they have never been employed in time of peace in any other American city, still stirs the blood of the survivors of those evil times. It has often been told, but it cannot be told, as in these pages, too often as a tonic to the true American spirit. Dr. Bowditch was a man of religious spirit, sensitive conscience, positive character, and genial disposition, a faithful exponent of "applied Christianity." His son has in this memorial of his life performed a patriotic service as well as a filial duty.

Life of the Ancient Greeks (The). By Charles Burton Gulick, Ph.D. Illustrated. (Twentieth Century Text-Books.) D. Appleton & Co., New York. 5⅛×8 in. 373 pages. $1.40, net.

Rationally conducted study of ancient languages, of which there has been too little, is study not only of the language but of the life of the people speaking it, with which their language is a means of opening acquaintance. Of Greek life in the golden age of Greece—the fifth and fourth centuries B.C.—Dr. Gulick gives a detailed description of interest to the general reader as well as to the student of Greek preparing for college examinations. The accompanying illustrations, numbering several hundred, are provided with all desirable interpretation in a descriptive list.

Little Boom No. 1. By Mrs. Frank Lee. Illustrated. The Pilgrim Press, Boston. 5×7½ in. 255 pages.

Memoirs of François René, Viscomte de Chateaubriand, Sometime Ambassador to England. Translated by Alexander Teixeira de Mattos. Illustrated. Vols. V. and VI. G. P. Putnam's Sons, New York. 6×9 in. $3.75 per vol.

The appearance of the final volumes in the English translation of Chateaubriand's "Mémoires d'Outre-Tombe" calls for added emphasis of The Outlook's criticism on the preceding volumes, in which the ordinary reader and the student of history alike find entertainment and enlightenment. The translator (whose work has been admirably done) even goes so far as to say that the Memoirs constitute the greatest prose work of the greatest prose writer of the nineteenth century. Not all readers will agree in this criticism; but it is safe to say that all who are interested in French history, politics, and society, all who love to signalize the quality of the romantic school in literature, as distinguished from the writing of the eighteenth century which preceded it and from the aridity which succeeded it, finally, all who glory in the work of the Spirit of God, will find in these volumes a rich store of knowledge and inspiration. Chateaubriand was a notable traveler; he and Marco Polo or Sir Richard Burton could have compared notes with interest and profit. He was a notable figure as a man of letters—some think as notable in his way in France as was Byron in England or Schiller in Germany. He was a statesman whose service to the monarchy is only now recognized at its full value. Above all, Chateaubriand was the man who dared to write the "Génie du Christianisme," and thereby to put into the world a spiritual force which had not before existed in such a form. The last two volumes of the Memoirs are distinguished from the others by reason of the author's description of his European travels, especially of his round trip from Prague to Prague (an itinerary to be commended to present travelers), by way of Eger, Baireuth, Würzburg, Heidelberg, Mannheim, Metz, Verdun, Châlons, Paris, Pontarlier, Lausanne, Bex, Brigue, Domo d'Ossola, Milan, Verona, Venice, Udine, Villach, Gmünd, St. Michael, Salzburg, Linz, Thabor, and then back to Prague. As in the previous volumes, great and picturesque figures flit across the stage, especially those of Talleyrand, Lafayette, Béranger, Guizot, Madame Récamier, Charles X., Thiers, Louis Philippe, but more interesting and perhaps more significant than any of these is the figure of Chateaubriand himself.

Mont Pelée and the Tragedy of Martinque. By Angelo Heilprin. Illustrated. The J. B. Lippincott Co., Philadelphia. 6×9½ in. 335 pages. $3, net.

Reserved for later notice.

Negro (The): Revelation in History and in Citizenship. By Rev. J. J. Pipkin. Illustrated. The N. D. Thompson Publishing Co., St. Louis. 6⅛×9⅛ in. 491 pages.

This volume is far from being literature, but none the less it deserves the attention of the book-reading public. Through condensed biographies of negroes who have been successful in various lines of work, it presents a record of negro achievement which will convince skeptical white people of the possibilities of negro advancement, and will inspire colored people with new faith in striving for their own advancement and that of their children. Best of all, the book is not written by a negro or by a Northern white man, but by a Southern minister, who, despite both sectional and political prejudices, has labored sympathetically to show what the negro race is capable of. The volume contains an introduction by General Gordon, formerly United States Senator from Georgia, which is written in the same spirit as the volume itself, and calls attention to the fact that there are a great number of negroes who are not "problems" but "useful citizens."

Old South Leaflets (The). Twentieth Series, 1902. Published by the Directors of the Old South Work, Old South Meeting-House, Boston. 5×7¼ in. 48 pages.

Old Testament Word Studies. By the Rev. C. E. Butler. Edited by Principal J. T. L. Maggs, B.A., D.D. The Abbey Press, New York. 5×8 in. 266 pages.

Organ and Its Masters (The): A Short Account of the most Celebrated Organists of Former Days, as Well as Some of the More Prominent Organ Virtuosi of the Present Time, Together with a Brief Sketch of the Development of Organ Construction, Organ Music, and Organ Playing. By Henry C. Lahee. Illustrated. L. C. Page & Co., Boston. 5×7¾ in. 345 pages. $1.60, net.

The somewhat limited interest in the organ ought to be increased by this volume. So far as we know, there is no other book that covers quite the same field. The work of the author has been done with evidently painstaking care. The growth of the organ is traced from its primitive form to the modern electric mechanism; but throughout the instrument is considered, not from the point of view of the builder, but from that of the performer and composer. The book is, therefore, to a very large extent biographical. A chronological table and an index make it valuable for reference.

Pipe Dreams and Twilight Tales. By Birdsall Jackson. F. M. Buckles & Co., New York. 4½×7 in. 257 pages. $1.25.

Poetical Works of John Keats (The). Edited by Walter S. Scott. Revised by George Sampson. (The "Hampstead" Edition.) The Macmillan Co., New York. 5×7¾ in. 632 pages. $1.75.

An admirable one-volume edition of Keats's poems, strongly bound, handsome of page, and well printed.

Primer of Right and Wrong (A): For Young People in Schools and Families. By J. N. Larned. Houghton, Mifflin & Co., Boston. 4½×7 in. 176 pages. 70c., net.

Problems of Modern Industry. By Sidney and Beatrice Webb. (New Edition.) Longmans, Green & Co., New York. 5½×8½ in. 286 pages.

A new edition of an interesting and valuable collection of essays by the historians of the English labor and co-operative movements. In their preface to this edition Mr. and Mrs. Webb comment upon the growing monopolization of industry in the United States, and urge that the movement is not to be resisted, but to be kept from injuring workmen by legislation, securing the latter a minimum of pay, a minimum of recreation, a minimum of sanitation, and a minimum of education.

Proofs of Life After Death (The): A Twentieth Century Symposium. Arranged under the several heads of Science, Psychical Research, Philosophy, Spiritualism. Compiled and Edited by Robert J. Thompson. Robert J. Thompson, 1604 Wellington Avenue, Chicago. 5½×8 in. 365 pages, $2, net.

Moved by the decease of a dear friend, and by desire to obtain all possible confirmation of his belief in immortality, the editor of this compilation addressed a circular-letter to a large number of persons of reputation, desiring their strongest reasons for this belief. The list of those whose judgment is here recorded fills four pages. The number of influential names in the list is noticeable, some of whom reply at considerable length. Another noteworthy thing is the general absence of references to Biblical evidence, and the grounding of belief on considerations supplied by science, psychical research, philosophy, and personal experience. While not all the contributions to the volume will equally commend themselves to all, it may be strongly commended as a whole to all who desire more light upon the great problem.

Reason, Faith, and Authority in Christianity: Being the Paddock Lectures for 1901-02. By Alfred Magill Randolph, D.D., LL.D. Thomas Whittaker, New York. 5½×8 in. 272 pages. $1.10, net.

These lectures by the Bishop of Southern Virginia were delivered before the students and professors of the General Theological Seminary in New York. They are the expression of the views of a conservative thinker with a progressive spirit. In the course of the lectures here embodied in book form the point of view seems to change frequently and unexpectedly. It is therefore almost impossible to indicate the course of thought or the conclusions reached. Perhaps some indication of the temper of the lectures may be given by saying that, in view of other positions maintained, it is significant to find the author declaring, for instance, that the distinction between natural and revealed religion rests upon an illusion.

Reformer (The). By Charles M. Sheldon. The Advance Publishing Co., Chicago. 5½×8 in. 299 pages. $1.50.

"The Reformer," like Mr. Sheldon's former and more original book, "In His Steps," is strong as a sermon but weak as a novel. Like its predecessor, it preaches the Brotherhood of Man, the duty of the rich and well born toward the "humanity that works with its hands for a living, the humanity that toils at the furnace and the loom and the machine." Although the scene might be laid in any great city where the boulevards are in direct juxtaposition to the slums, New York seems to be the modern Gomorrah portrayed. In one of its heroes, the vigorous young attorney, Judge Julius Chambers, with his quiet voice and scholarly face, one recognizes at every turn Mr. Jerome. The most striking figure, and, unfortunately, the most true to life, is the City Boss, Tommy Randall. He seems flesh and blood; the reformer, John Gordon, and his friends at the Hope House Settlement do not.

Russell Ryder. By David Bruce Conklin. The A. Wessels Co., New York. 5×7½ in. 333 pages. $1.50.

Schillers Wallenstein Tod. Edited by Charles A. Eggert, Ph.D. D. C. Heath & Co., Boston. 5×7¼ in. 189 pages.

School Composition for Use in Higher Grammar Classes. By William H. Maxwell, M.A., Ph.D., LL.D., and Emma L. Johnston, A.B. The American Book Co., New York. 5×7½ in. 224 pages. 50c.

Sea of Circumstance (The). By Jeanne G. Pennington. The Abbey Press, New York. 4¼×7 in. 142 pages. 50c.

Shroud of Christ (The). By Paul Vignon, D.Sc. Translated from the French. With Photogravure and Collotype Plates and Illustrations in the Text. E.P. Dutton & Co., New York. 8½×11 in. 170 pages. $4, net.

An attempt to prove by scientific testimony

that the holy shroud of Turin is the veritable shroud that enwrapped the body of Christ. The argument is based on the statement that the impression upon the relic was made by a chemical process, resulting from a combination of ammoniacal vapors from the body and the spices smeared upon the cloth. Notwithstanding the flaws in the argument, the reasoning is ingenious. The accounts given of elaborate investigations and the examination of minute details lend an air of plausibility to the discussion. The volume is sumptuously printed and illustrated. Altogether it leaves a strange impression of mingled mediævalism and modern science.

Stories of Humble Friends. By Katharine Pyle. Illustrated. (Eclectic School Readings.) The American Book Co., New York. 5×7⅛ in. 197 pages. 50c.

Stories of Old France. By Leila Webster Pitman. Illustrated. The American Book Co., New York. 5×7¼ in. 312 pages. 60c.

An interesting attempt to present French history in a semi-fictional form, and as an introduction to more thorough study. There are many well-selected pictures.

Studies in the Apostolic Church. By Charles Herbert Morgan, Thomas Eddy Taylor, and S. Earl Taylor. Jennings & Pye, New York. 6×9 in. 226 pages. 75c.

Successful Advertising: How to Accomplish It. By J. Angus MacDonald. The Lincoln Publishing Co., Philadelphia. 6⅛×9⅛ in. 400 pages. $2.

Sur les Bords du Rhin: Selections from Victor Hugo. Edited by Thomas Bertrand Bronson. Henry Holt & Co., New York. 4×6½ in. 148 pages.

Sunday. By Rev. W. B. Trevelyan, M.A. (The Oxford Library of Practical Theology.) Longmans, Green & Co., New York. 5×7⅛ in. 307 pages.

This book is an attempt in untechnical form to account for the origin of the Lord's Day, show its relation to the Jewish Sabbath, trace its history until the present time, and state its proper function. According as Christianity is conceived of as primarily a new Law or primarily a new Life, Sunday is correspondingly a Sabbath or the Lord's Day. Both historically and philosophically the author finds that the observance of Sunday is not obedience to an external command, but is "the utterance and expression of Christian joy." Its sanction is not to be found in the Fourth Commandment, but in the Resurrection. Nevertheless, the author has the breadth of mind to recognize the service that the Sabbatarian view of Sunday has temporarily rendered to the race and is likely to render for generations to come. After a chapter on Principles of Sunday Observance, the author considers in three successive chapters the subjects of Worship, Rest, and Service. The first is treated from the point of view of the clergyman of the Church of England. It is a pity that some of the very impressive truths which need wider acknowledgment than they receive generally by Protestants should be put in language which can appeal to but few except those of the Anglican Communion. The emphasis which is laid upon service—that is, philanthropic and religious activity—is significant of the awakened social consciousness of the Christian Church. There are a number of interesting appendices.

Tale of a Tub (A). By Jonathan Swift. Herbert B. Turner & Co., Boston. 4⅛×6⅛ in. 284 pages. $1.25.

Territorial Growth of the United States (The). By William A. Mowry, M.A., Ph.D. Illustrated. Silver, Burdette & Co., New York. 5×8 in. 237 pages. $1.50.

Treatise on Atonement (A). By Hosea Ballou. (Fourteenth Edition.) The Universalist Publishing House, Boston. 5×8 in. 272 pages. $1, net.

Treasure Island. By Robert Louis Stevenson. Edited by Hiram Albert Vance, Ph.D. The Macmillan Co., New York. 4×5⅝ in. 229 pages. 25c.

Twelve Types. By G. K. Chesterton. Arthur L. Humphreys, London. 5⅛×7 in. 203 pages.

Usury: A Scriptural, Ethical, and Economic View. By Calvin Elliott. The Anti-Usury League, Millersburg, Ohio. 5×7¾ in. 299 pages.

An arraignment of the taking of interest written in the spirit of the prophets of the early Christian and mediæval Church. The author does not, however, condemn rent as well as interest, nor recognize, as did the Genevan theologian after whom he is named, that interest on money in ordinary commercial transactions is merely rent for the land, houses, or other capital which the money enables the borrower to use. Despite its inadequacy on the side of economics, however, the book has intellectual strength as well as moral fervor, and is profitable reading to morally sensitive minds.

Vale of Cedars and Other Tales (The). By Grace Aguilar. Illustrated. The Jewish Publication Society of America, Philadelphia. 5½×8 in. 428 pages.

These tales were favorite reading in households of a generation ago, and their fine moral spirit and honest wholesomeness has caused their reappearance.

Where American Independence Began. By Daniel Munro Wilson. Illustrated. Houghton, Mifflin & Co., Boston. 5×8¼ in. 289 pages. $2, net.

Though a panegyric upon the town of Quincy and all her children and stepchildren, this finely illustrated volume has more than a local and family interest, for the children include the Adamses, the Quincys, the Hoars, and the Hancocks, and the stepchildren include Sir Henry Vane and Anne Hutchinson.

Who's Who, 1903: An Annual Biographical Dictionary. Fifty-fifth Year of Issue. The Macmillan Co., New York. 5×7⅛ in. 1,532 pages. $1.50, net.

Indispensable as a book of reference to those who have occasion to verify names, find residences, and otherwise search for biographical data about living Englishmen. With its American companion of the same name, "Who's Who" is perhaps more frequently looked into than any reference-book except the dictionary. That it is closely condensed and (happily) has no critical estimates makes it possible for its scope to be really large. There are some non-Englishmen included; we judge that the number of Americans has been increased considerably since the last edition.

Correspondence

A Defense of New Mexico

To the Editors of The Outlook:

In your issue of December 13, page 862, you make some comments on New Mexico which are unworthy of The Outlook. I credit you with a desire to be just and fair. The man who has always lived in Timbuctoo does not usually write intelligently about New York. You are equally uninformed about New Mexico. In referring to the population of the Territory, the statement that the "56,000, or less, classed as Americans, though in reality they are largely foreigners of various nationalities," is not correct. More than ninety per cent. of them are natives of the other States, although we have a fair representation of English and Germans.

The statement that "*all* proceedings in the courts require the co-operation of an interpreter," etc., is untrue. The writer has been familiar with the courts of New Mexico for thirteen years, and while the interpreter is a court official, there have been many terms of court at which his services were not needed. During the years above mentioned I have never seen a Mexican juror who did not understand English. The fact that "ballots are printed in Spanish as well as English" means that those who do not read English vote intelligently in New Mexico, while the foreigners in New York City, Pennsylvania, Wisconsin, and other States having a large non-English-speaking population cast ballots that they cannot read and do not understand. The "voting in herds" is not nearly so common in this sparsely settled country as it is in the cities of the East. The independent voter, both American and Mexican, is much more in evidence here than in New York.

You say that "the occupations of the people are agriculture, stock-raising, and mining. The two former are dependent absolutely on irrigation." The latter part of this statement is flagantly untrue. Not one hundredth part of one per cent. of the stock-raising interests of the Territory depend on irrigation. A few cattle are *fattened* on alfalfa and corn raised by irrigation, but the great stock interests—cattle, sheep, and horses—depend entirely on natural grasses. These grasses "cure" on the ground, and furnish nutritious food for stock during the winter and early spring. Granting that our people are agriculturists, stock-raisers, and miners are those occupations a bar to good citizenship? Are the citizens of rural New York less worthy of the right of suffrage than the denizens of the East Side? You probably do not know that the mining population of New Mexico and Arizona are nearly all Americans, and have nothing in common with the ignorant foreigners who work the coal-mines of the East.

Your statement of insufficient water supply for irrigation is not based on a knowledge of the facts. In ten years' time you will treat us more fairly on that topic, as you will be better informed.

Again, you say that "the people both in New Mexico and Arizona care very little about Statehood." I speak only for New Mexico, as my knowledge of Arizona is limited to car-window investigations, and hence is not by authority. The people of New Mexico want Statehood. They do not spend all their time lobbying in Washington, because they have duties at home to perform. They do not base their claim for Statehood on the ground that it would "be for the advantage of the people of the United States to admit" us. We do not pretend to be looking out for your good. We are neither philanthropists nor hypocrites. We want Statehood because it would be for our own material and social advantage, and because it is our right. More than fifty years ago the United States Government by solemn treaty promised it to us, and a refusal to carry out this promise is a flagrant injustice.

You say, "It is the undeveloped mining claims that furnish the demand on Congress" for Statehood, and that "this demand comes, not from the people of those Territories, but from capitalists outside of them." This statement is not only untrue but libelous. No portion of the Territory is more enthusiastic for Statehood than the fertile valley of the Pecos, in the southeastern part, and there is not a mine or a mining claim in the whole region. If it an argument against Statehood that

outside capitalists want to build railroads, develop mines, establish manufacturing plants, and convert into the current coin of the realm the vast natural resources of this region, and that they prefer to have their investments protected by the more stable form of a State government? The position of Senators Quay and Penrose is born of the fact that they are better informed than their colleagues. They may have "axes to grind," but they are on the right side at any rate, and impugning the motives of a man does not prove him wrong.

Your statement that "it will be supported by the Democratic votes, because it is morally certain that the Senators from both States will be Democrats" is without excuse. The native of Ceylon does not believe that water ever becomes congealed, and you are not supposed to know the material resources or social conditions of New Mexico; but there is no excuse for your not knowing that Arizona is Democratic and that New Mexico is Republican—both beyond the probability of a change.

Senator Quay's letter and his defense of the same does not refer to New Mexico but to Arizona. Delegate Rody's statement quoted by you is one of the arguments for Statehood, and is a worthy and pertinent one.

You say, "Should they [New Mexico and Arizona] be given in the Senate equal votes with such States as New York, Pennsylvania," etc.? This question was settled more than one hundred years ago in the Constitutional Convention. To say the least, the argument is a little late. Why didn't you mention Delaware and Rhode Island, and why don't you start a crusade to put out the last-mentioned commonwealths? In this last objection you inadvertently lay bare the real cause of Eastern opposition to Statehood. It is not political. It is not social or financial. It is not even racial or linguistic. It is purely sectional. You of the East do not want the West to have any more power or any greater vote in the Senate.

Now just a word on the other side of the question. There are three classes of people in New Mexico. First, the so-called Americans, being English-speaking people "from the States." Second, the educated Mexicans, being descendants from the Spanish cavaliers. Third, the common Mexicans, mostly agricultural laborers, sheep-herders, etc., being descendants from the native Pueblo Indians. The first class are energetic, active, intelligent business men, stock-raisers, and farmers. They belong to the same class of men who peopled the Western Reserve and who extended our domain from the Alleghanies to the Pacific. Their character needs no defenders. The second class are educated, refined, high-toned gentlemen, the majority of them wealthy, whose sons are educated in the universities of the East and of Europe, and whose daughters are sent to Eastern convent schools. They speak English and Spanish with equal fluency, and compare favorably in intelligence, morality, and refinement with the wealthy and not over-energetic citizens of New York. I refer to New York because it is my native State and I am familiar with its social and political conditions. The third class contains many uneducated persons, although a large portion of them read and write the Spanish language, and many of the younger ones speak and read English. They are of a lower order of intelligence, but are not vicious or criminal. Their chief characteristic is never to do anything to-day if it can be put off until to-morrow. The first two classes control the business and politics of the country, and taken together are numerically greater than the third class. The Mexicans of the latter class who do not speak English are very anxious that their children should learn the language, and to this end demand that the Mexican schools be taught by American teachers. Several Mexicans of this latter class requested the writer to lay a protest before the Board of Education of this town against the teacher of the Mexican school—who, by the way, is a native of Indiana—for giving his instruction in Spanish. They wanted their children taught English. Their protest was well taken. The present teacher of the Mexican school speaks little or no Spanish. I repeat, the lower-class Mexicans are not vicious. Their worst characteristic is that they do not lead a "strenuous life."

The proportion of violations of the law is not as great in New Mexico per capita as in New York; while many of the crimes committed in the East are unknown here. Since the organization of the two counties

comprising the rich valley of the Pecos, there has never been a case of homicide the object of which was money or robbery. There has not been a single case of burglary of a dwelling-house. In short, crimes caused by greed for money or crimes against the sacredness of the home are unknown. The petty thief is conspicuous by his absence. The writer has been a householder for the past twelve years, and has never pretended to keep doors and windows locked. I'll wager that your doors are double locked and your door-mat chained down. Violations of the law are confined largely to homicides arising from disagreements and the larceny (illegal branding) of cattle.

Now, one final word in reference to the Senate Committee and its remarkable report. All New Mexico is divided into three parts: First, the Rio Grande Valley, where, with the exception of a few towns like Albuquerque and Las Vegas, the Mexican population predominates; second, the White Oaks country along the Rock Island road northeast of El Paso, where Americans are largely in the majority; and, third, the Pecos Valley in the southeastern portion, where the population is from ninety-five to ninety-eight per cent. American. The Senate Committee came to the Territory and spent a week or ten days in the Rio Grande Valley interviewing school-children on the street and asking them if they could speak English, photographing dockets of Mexican Justices of the Peace, gathering information for the purpose of confirming an opinion already formed and to secure evidence in support of a report already formulated. The Committee refused to visit the growing American towns along the Rock Island road, where evidences of wonderful industrial activity and development are to be seen on every hand. It entered the Pecos Valley—a region richer in natural resources than either of the States represented by Senators Dillingham and Burnham—after dark and left it before daylight. A committee of citizens at Carlsbad boarded the car and invited the Senate Committee to remain over and get some reliable information as to the material resources and social conditions of the country. We were curtly informed that the Committee had no time for this.

Of the two portions of New Mexico where the English-speaking populatio has increased two hundred per cent. sinc the last census, and where material wealt has quadrupled in the same time, one wa ignored entirely and the other was inve tigated in the night and the investigator were asleep. These men, instead of ac ing as public officials on their solem oath, were seeking *ex parte* evidence i support of a conclusion already formed They were wide awake in our India pueblos, but slept soundly in our America communities. They used the money o the Government, not for honest investig tion, but as sectional partisans. In bus ness this would be criminal, but in politic it is Senatorial courtesy.

Do you think for a moment that a repor made in this manner is entitled to cre dence?

C. H. McLENATHEN.

Carlsbad, N. M.

[This is the strongest statement w have seen in support of the admission o New Mexico as a State. It suffices here t say, however, that although the people o New Mexico are justified in seeking ad vantage for their Territory, the Federa Government must decide the questio according to the best interests, not o that Territory alone, but of all the Unite States.—THE EDITORS.]

The Working-Girls' Vacation Society

To the Editors of The Outlook:

The Working-Girls' Vacation Society wishes to express its gratitude to th readers of The Outlook who so generously responded to the appeal made in August Three hundred and ninety-five dollar was received by the treasurer, and thi amount made it possible to open the plac at Cornwall that had been put at th disposal of the Society for the rest of th season. When the offer of this beautiful old country seat was made, the manager were on the point of refusing it, when the idea occurred to one of them to ask the aid of The Outlook. Twenty-five girls were given a vacation of from two to four weeks. All the girls who are sent away by the Society have been pronounced by the examining physician as needing the vacation. So to most of these girls the vacation has meant not only a pleasant rest in the country, but also the gain of sufficient health and strength to carry them through the winter's work.

We Would Give $50,000 in Cas

if the people of the United States could in some way be made to realize that the greatest that has ever been made in real estate, or probably ever will be made, is embodied in proposition to sell a lot in New York City, with all city improvements, for **$510**—because i situation were actually understood by every person in the country, there would not be single foot of property left twenty-four hours after this knowledge was brought to their atten

We are selling lots for about **$500** which are intrinsically worth **$20,000**, if you will into consideration the three elements which go to make up values in New York City ou of fashionable districts: distance from the center, transportation facilities, rate of fare.

The difference is, the **$20,000** lot had transportation to it several years ago, and now is rounded with houses costing from **$10,000** to **$40,000** apiece, while our land, which has now just secured this improvement in transportation, must wait till the people realize this has been secured, and until the solidly built portions (now so comparatively close t have reached and enveloped us, and actually brought the values where they rightfully belo

Illustrations: Lot on corner 146th Street and Third Avenue, New York City, worth in 1881 $1,500, sold in spring of 1 $70,000 to Henry Lewis Morris. His grandfather sold it for $155 in 1853.
Lot on 80th Street, opposite Central Park, sold in 1850 for $500, in 1901 brought a price that showed an increase of $500 60 days from 1850 to 1901. (Authority, Real Estate Editor, New York Sun.)

Corner of Utica Ave. and Linden Boulevard, Rugby. Showing the high character of our improvements.

This increase will be maintained as surely as New York is destined to grow. As sur equal transportation makes equal values, so surely will this lot be worth as much as the lo upper Manhattan.

We can prove it if you come to New York. We will try to prove it if you will send your name and address. Is it not worth your while? We don't ask anything of you exce letter or a postal. If we were sure you were in good earnest we would far rather say, sen your name and we will send you tickets to New York. This you know is obviously im sible, but if you will let us put the matter before you we will in some way prove that proposition is a sound one, if we have to bring you to New York to do it.

What we want is to have you know that we are honest, and that every statement we m is incontrovertible truth. Then we are absolutely certain that we can do business t ether

We sell a **$510** lot for **$10** down and **$6** per month. This carries a life insuranc guaranteed increase of **25%** in one year, a free round-trip to New York (east of Chicag like distance), all improvements, your money back with **6%** interest if not found as re sented. What more can we do? Now, will you send us your name?

CORRESPONDENCE 269

The Outlook is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The first issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

Price.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

Postage is Prepaid by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila Samoa, Canada, and Mexico. For all other countries in the Postal Union add $1.56 for postage.

Change of Address.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

Discontinuances.—If a subscriber wishes his copy of the paper discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

How to Remit.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of THE OUTLOOK COMPANY. Cash should be sent in Registered Letter.

Letters should be addressed:

The Outlook

Published Weekly

Vol. 73 January 31, 1903 No. 5

The War in Venezuela It is certainly difficult to apply any other term than war to the events of last week—the bombardment day after day of Fort San Carlos by three German war-ships, with its active and desperately continued defense, the destruction of a fishing village, and the enforcement of the blockade so closely that twelve fishermen on a little island were, it is reported, cut off from supplies and starved to death. The prestige of Germany, so the German Chancellor declared, required these things, as well as the recalcitrancy of the Venezuelans; but public opinion both in England and America, if one may judge by the comments of the press, does not consider that prestige greatly enhanced by acts of force toward a weak nation, acts certainly not absolutely necessary, even if technically justified, and especially to be regretted because they occurred precisely when the prospects of amicable arbitration were most satisfactory. Even at the beginning of this week it is not certain exactly what took place at Fort San Carlos. This fort guards the entrance to Lake Maracaibo, where one Venezuelan gunboat remained uncaptured. Either with a view to seizing this gunboat or to prevent violations of the blockade, the German small war-ship Panther approached the entrance. German accounts say that she was fired on by the fort; Venezuelan accounts say that the Panther fired the first shot; other reports, which seem inherently rather more probable, say that the fort fired a blank shot as a notification that the Panther should communicate her intentions to the fort before passing; at all events, the Panther opened fire in earnest, was vigorously shelled by the fort, was repulsed, and later returned with two larger ships, the Vineta and Falke, and began a terrible bombardment. The fort was soon battered and nearly destroyed, but only after a very brave defense and a considerable number of fatalities; even as we write it does not appear positively either that the fort is in the hands of the Germans or that the Panther has crossed the bar into the Lake—the other vessels are of too great draught to do so.

The Effect of Hostilities It was only after some days that Germany made the statement that the attack on the fort was caused by a prior act of hostility on the part of its Venezuelan commander, General Bello, while the Venezuelan Foreign Minister as late as January 25 declared positively that the Panther attacked first and without provocation. Meanwhile Mr. Bowen, our Minister to Venezuela, now acting as Venezuela's agent to procure a settlement with Great Britain, Germany, and Italy, arrived in Washington and at once undertook negotiations looking to a cessation of the blockade, a guarantee of some sort that Venezuela would obey the decision of the Hague Tribunal—possibly through banks or by putting the Venezuelan customs under charge of a commission—and the early reference of the dispute to that international court. The renewal of hostilities had an adverse influence, but the opinion is now expressed at Washington that a settlement of some kind will soon be reached. The English people and press have shown uneasiness at what they do not hesitate to call Germany's unwise, wanton, and brutal conduct, and, in the words of the "St. James's Gazette," express the hope that "the Americans will understand that the German proceedings are as little approved by the British nation as by themselves." It is evident that in such a state of tension as exists in and about Venezuela it is perfectly easy to find an excuse for

using force; it is said with reason that the opposite course, the avoidance of arbitrary measures except under extreme provocation, should be taken by a great Power trying to deal firmly but not roughly with a weak debtor for what seems to be after all a comparatively small money demand. Especially is violence regrettable at a time when the United States has used its good offices to bring about a peaceful settlement, and acts of force, unless absolutely needed, may be interpreted as in a way a slight to this Nation. It does not appear that President Roosevelt has made any remonstrance with Germany; it is certain that he would not do so without an absolutely complete knowledge of the facts; it is equally certain that his influence will be used to its utmost for peace, forbearance, and arbitration.

❀

Cuban and Philippine Legislation

The week in Congress was full of interesting events. To begin with, the Cuban treaty was modified as the Beet-Sugar Association demanded, by incorporating the provision that the duty on sugar imported from any foreign country should not be lowered during the term of the treaty. This was virtually a pledge that no other reciprocity treaties should be made with sugar-producing countries during the next five years, and that Germany, for example, should not be accorded the commercial privileges of "the most favored nation" if she offered us concessions similar to those offered by Cuba. Our reciprocity treaty with Hawaii was never regarded as in violation of our treaties with the European Powers guaranteeing them the commercial treatment of the "most favored nation," because no one of them cared to make corresponding reciprocal concessions to us; but the Cuban treaty in its new form makes possible protests from other Powers. This feature of the Cuban treaty, coupled with the fact that it changes tariff schedules without the concurrence of the House of Representatives, has been made the occasion of Democratic hostility to the treaty, and only the refusal of Senator Morgan, of Alabama, and one or two others to act with their party in this matter has prevented the blocking of the treaty by partisan opposition. In the Senate's modifications of the Philippine Bill the influence of the beet-sugar interests is also apparent. These interests, united with those of the tobacco-growers, have changed the text of the act so that Philippine sugar and tobacco sent to this country must be subjected to fifty per cent. instead of twenty-five per cent. of the rates imposed on foreign sugar and tobacco. When the House of Representatives acted on the Philippine Currency Bill last week, all of the Democrats united with twenty-odd anti-silver Republicans to extend our currency system to the Philippines, instead of following the Insular Committee's plan to give the islands a silver currency to be kept at par with gold by the Philippine Government. The vote in favor of the substitute was 146 to 128. The extraordinary support given by the free-silver party to an apparently anti-silver measure was avowedly based upon the Democratic objection to a colonial system and all attempts to treat the people of the Territories differently from those of the States.

❀

The Anti-Trust Bills

Last week the more aggressive friends of anti-trust legislation were somewhat alarmed to find that they were likely to secure an uncontested victory at the present short session of Congress. Senator Elkins, of West Virginia, the Chairman of the Committee on Inter-State Commerce, has introduced a modified form of Attorney-General Knox's anti trust proposals as an amendment to the bill creating a new Department of Commerce. As the Department of Commerce Bill has already passed both houses (though not in the same form in each house) and is in the hands of a conference committee, any amendments now made to the bill can secure immediate consideration in both houses—for conference reports on bills which have already passed take precedence of all new legislation. The introduction of anti-trust legislation in this manner, therefore, insures prompt action. The feature of the situation which causes alarm to the anti-trust radicals is the fact that Senator Elkins has been regarded as a pro-trust radical, and the modified form of Attorney-General Knox's programme which he has accepted is understood to represent the

views of that faction of the Senate with which he has been identified. Upon this point we must defer judgment until the full text of the compromise measure is before us. According to Mr. William E. Curtis, the well-informed correspondent of the Chicago "Record-Herald," the new bill is entirely satisfactory not only to the great railroad interests but also to the trusts which aspire to hold permanently the confidence of the investing public. Says Mr. Curtis:

> The managers of the small trusts and the weak trusts, those that are waterlogged by the issue of excessive stock, and those which for any other reason shrink from public exposure of their assets or transactions, are opposed to all legislation, . . . but the managers of the Standard Oil Company, the United States Steel Corporation, the Pennsylvania, New York Central, Great Northern, Santa Fé, Southern Pacific system, the Southern Railway, the Gould system, the coal roads, and all the great combinations controlled by Pierpont Morgan, not only favor it, but are desirous that it should be placed upon the statute-books before the adjournment of the present Congress. I have seen representatives of the interests I have named, and they comprise all the great trusts except the American Sugar Refining Company, or sugar trust.

Of course this attitude on the part of the trust magnates has prejudiced the compromise bill in the eyes of the radicals, who assert that their constituents will not be satisfied with any measure which merely keeps railroads from cutting rates and secures only enough publicity to protect stockholders against fraud. They admit that both these ends are good in themselves, but insist that the consuming public as well as the investing public needs to be protected against the abuses of private monopoly.

The Statehood Bill In the Senate the Omnibus Statehood Bill held the right of way, despite the attempt of Senator Cullom, of Illinois, to set it aside in order to take up the consideration of the Cuban treaty. The vote against Senator Cullom's proposal was 37 to 27, or, including pairs, 48 to 38. All the Democrats and sixteen Republicans voted to keep the Statehood Bill the unfinished business of the Senate. Senator Burnham, of New Hampshire, made a two days' speech against the bill, and other opponents of the measure are ready to postpone a vote by long speeches, but the friends of the bill claim to be able to force a vote before the session ends. The debate of the bill on the Republican side still turns largely upon the extent to which Republican Senators are bound by the Statehood plank in the Republican National platform. Senator Hanna, of Ohio, contended that the plank was not binding at all, because the Democratic platform contained a similar plank and the issue did not enter into the contest. Senator Beveridge, of Indiana, took the much more tenable position that the issue did not enter into the minds of the voters in any considerable part of the country, and that the constituencies could not therefore be supposed to have instructed their representatives thereon. Senator Foraker, of Ohio, who supported the Statehood Bill, admitted that the Statehood plank did not command any consideration in the East, but declared that it was adopted to strengthen the Republican party in the West, and was binding upon those who cared to discharge party obligations deliberately assumed. The other point most discussed was the fitness of the "native" or Spanish-speaking population, strong in Arizona and predominant in New Mexico, to assume the duties of citizens of American States. Upon this point the debate was singularly non-partisan, for the criticism of the Mexican elements in the citizenship of the two Territories came exclusively from the Republican party, to which most of these Mexican voters belong. In the Congressional election last fall the "American" counties in the two Territories were generally close or Democratic, while the Spanish counties of the Rio Grande valley went Republican by overwhelming majorities. The opposition to Statehood for these two Territories is not based upon partisan considerations. New Mexico is more strongly Republican than Arizona is Democratic.

The Panama Canal Treaty Last week Secretary Hay recorded another triumph of American enterprise and tact in the signing of the Panama Canal treaty. Fears have been entertained that the Colombian Government would not be willing to accede to the

wishes of the United States in the matter of annuity, and hence that it might force on our own Government a recourse to the Nicaragua project, the less desirable route for an interoceanic canal. As all the subjects for a treaty had been agreed upon except the annuity, it was hoped that a reasonable compromise might be effected between the sum of $100,000 a year which our Government had offered, and the sum of $650,000 demanded by Colombia. Mr. Hay finally arranged this compromise, and an agreement was made upon the sum of $250,000 a year, on which the Colombian Government transmitted instructions and authority to Dr. Tomas Herran, its representative in the United States, which made possible the signing of a treaty, thus concluding the complicated and long-pending negotiations for an Isthmian Canal. The treaty provides for the canal on terms which should prove satisfactory both to the United States Senate and to the Colombian Government. The titular sovereignty of that Government over the leased strip of land, six miles wide, through which the canal will run is recognized, and the free transit of Colombian troops in this territory permitted. The cash payment to be made is $10,000,000, as already agreed upon, and the annual rental of $250,000 is to begin in nine years. By the terms of the treaty the Panama Railway reverts to the United States at the end of sixty years. Ample recognition is made of the delicate matter of Colombian sovereignty, which formed a particularly vexatious and serious obstacle to the completion of the treaty, by an arrangement for policing and for the establishment of justice through a Joint High Commission, although no American citi en may be tried except by his own courts. The United States Government will be permitted to police the strip of land, but it will not be allowed to land troops there except in case of a great emergency, or at the request of the Colombian Government or that of the State of Panama. While the cities of Colon and Panama are not included in the leased strip, the control of the waters of the two ports, as well as the collection of port and tonnage dues and all other matters necessary to the construction and administration of the canal, is by the terms of the treaty vested in the United States.

The Treaty's Ratification

As Secretary Hay has been in close touch with the leading Senators throughout the negotiations leading up to the signing of the treaty, the prospect of its ratification by Congress is considerably increased. Most Senators, we believe, now realize that the Panama route is better than the Nicaraguan, not only because it is shorter, cheaper, and more feasible as regards quick canal construction, but also because, for these very reasons, the menace is removed to the possible construction by another Power of any other canal, which would have existed with regard to the uncompleted ditch at Panama had the Nicaragua route been chosen. There may be more difficulty with the Colombian Congress than with our own as to ratification; but, since finances in that country are in a bad state owing to the inflation of the currency and an unpaid army, the Colombian Congress at its spring session may feel that this treaty, which by its law must pass both houses, should pass with as little delay as possible. While the payment of $40,000,000 to the French company for its canal rights and of $10,000,000 to Colombia for concessions will constitute one of the largest financial transactions ever made by the Treasury Department, no payments will, of course, be made until after the treaty has been ratified by the Senate and the Colombian Congress. Elections for members of the Colombian Congress are now being held, and are not uninfluenced by the prospect, first, of the assurance of a substantial increase of State income; secondly, of a gigantic and ever-increasing trade; and, thirdlv, of the renewal of guarantees of protection from this country. For while the treaty pledges Colombia not to cede any territory, mainland or insular, in the neighborhood of the canal, among all the twenty-eight articles none will attract more attention throughout the world than the following:

Article IV.—The rights and privileges granted to the United States by the terms of this convention shall not affect the sovereignty of the republic of Colombia over the territory within whose boundaries such rights and privileges are to be exercised. The United States freely acknowledges and recognizes this sovereignty and disavows any intention to impair it in any way whatever, or to increase its territory at the expense of Colombia or of any of the sister republics of Central or South America, but, on the contrary, it desires to

strengthen the power of the republics on this continent and to promote, develop, and maintain their prosperity and independence.

❀

The Alaskan Treaty

The Panama Canal treaty was not the only one secured last week by the American Department of State. Within two days of the signing of that treaty, Mr. Hay and Sir Michael Herbert, British Ambassador at Washington, signed a treaty for the adjudication (*not* the arbitration) of the Alaskan boundary question. By the terms of the agreement, the matter is to be referred to a Commission consisting of six eminent jurists, three to be appointed by each of the two Governments concerned. This is precisely the plan proposed by Colonel Hay three years ago. It was rejected then by the Canadian members of the Joint High Commission which was sitting in Washington to settle twelve points of difference between Canada and the United States—the Atlantic and Great Lakes fisheries disputes, the transportation of goods in bond, the delimitation of the Minnesota boundary, and other questions, of which by far the most important was that of the Alaskan boundary. It is believed that all of these questions save the last would have been speedily disposed of if it had not been for the rejection of Mr. Hay's proposal. The Canadians did this because they were contending for arbitration, a suggestion emphatically declined by our Government in view of the fact that it held a complete title to Alaska. This title had been not only unchallenged but repeatedly acknowledged by Great Britain until the discovery of Klondike gold. Then Canada succeeded in persuading England to take up the contention that the eastern Russian boundary of Alaska was originally measured from the outer rim of islands skirting the coast, and not from the edge of the mainland. This admitted, Canada would gain several seaports. The Commission adjourned without having decided a single one of the points of difference for the settlement of which it had originally met. Influenced strongly by the Canadian Government at a time when the British army needed colonial strengthening, Lord Salisbury's Government actually refused for a time to proceed with the revision of the Clayton-Bulwer Treaty, until Canadian claims in Alaska were settled. However, Mr. Hay did secure the signing of a *modus vivendi*, on the understanding that the claims of both nations should not be affected by the agreement, which did not give to Canada a free port or access to the Lynn Canal through Canadian territory.

❀

Anglo-American Friendship

If credit was due to the American Secretary for the *modus vivendi* established, greater credit should be accorded to him for finally inducing the British and Canadians to abandon their demand for arbitration purely on a question of legal title. Sir Michael Herbert's signature thus finally disposes of the insistence from our Northern neighbors that to the Commission of six men there should be added a seventh member, from a third and neutral nation, to act as umpire. The result of all is not only a personal victory for Secretary Hay, but is a welcome manifestation of British friendliness. Satisfaction is evident both in Washington and in London. In the first capital the treaty has created enthusiasm in Congress; and rightly, for, like the Panama treaty, it was drawn up only after thorough consultation with the leading Senators, both Republican and Democratic, the Administration being earnestly desirous of doing all possible in advance to secure the prompt ratification of both treaties. In London the Alaskan treaty is hailed with satisfaction by the English press in general, on the ground that, at a critical moment in the Venezuela trouble, it gives to America undoubted proof of the uninterrupted friendliness existing between Great Britain and the United States; and in particular the words of the London "Times," long the leader of English newspapers, deserve repetition. The "Times" rejoices at the constitution of the proposed Commission, which, it says, "implies a high degree of confidence on each side in the equity and the friendship of the other side. The same Commission with an odd man added would become virtually an arbitration court. Though arbitration is a very good thing in its way, it is not nearly as good as direct negotiation, if only because it

imply so much mutual confidence and good will."

❀

Legislatures Deadlocked and Disgraced

This winter, as every winter for many years, several of the Legislatures with a United States Senator to elect have enacted scenes of political scandal. Last week the Republican legislators of Utah on the first ballot elected the Mormon missionary and Apostle Smoot to the Senate, and those of the New York Legislature on the first ballot re-elected Senator Platt. The selection of Apostle Smoot may be defended as representing the choice of a majority of the voters of Utah; but the selection of Senator Platt has not even this defense. Senator Platt was distinctively the candidate of the Republican machine, and had a control over the majority in the Legislature, largely composed of men dependent on the machine, which he could not exercise over the voters of the State or even the thick-and-thin supporters of his own party. Even in the Legislature three Republicans, voicing, as they said, the almost unanimous sentiment of their constituents, defied the political machine and voted for Mr. Root. In Delaware the deadlock of years remains unbroken, the corruptionist Addicks controlling twenty-one votes, the Democratic candidate twenty-one, and the anti-Addicks Republicans ten. The Democrats have proposed to the anti-Addicks Republicans to unite with them in electing a Republican for the long term in the Senate and a Democrat for the short term, and this offer is under serious consideration in Delaware. Unfortunately, Senator Hanna has interfered in the contest by protesting against any fusion with Democrats which would rob the Republicans of any of the fruits of Mr. Addicks's bribery. If Republican union upon Mr. Addicks is brought about by outside pressure upon the Legislature, the voters of Delaware will be wronged, for neither a majority nor a plurality of voters ever gave their support to the great corruptionist. The position taken by Senator Hanna seems to be that Mr. Addicks is entitled to the fruits of a victory for which he has paid a large sum in cash; that common honesty is not among the necessary qualifications of a Senator; and that a Republican who buys votes, bribes legislators, and corrupts half the adult male population of the State is better qualified than any Democrat could possibly be to make laws for a nation of honest men and women. This may be "good politics," in the narrow, partisan sense of the words; but it strikes us as very bad morality.

❀

The Colorado Conflict

In the Colorado Legislature the scenes of last week were even more sensational than in Delaware. The Colorado Senate, by reason of the hold-over Senators, was, on the face of the returns, Democratic by a vote of 23 to 13; the House, whose members were all newly elected last fall, was Republican by a vote of 31 to 28. Democratic frauds were charged in the county containing the city of Denver, and on the basis of these charges the Republican House unseated just enough Democratic members to give their party the control of the Legislature on joint ballot. The Democrats do not seem to deny the seriousness of the frauds charged, but claim that they were quite insufficient to offset their heavy majority in the county. On the strength of this claim they proceeded to unseat enough Republican Senators to give them again a bare majority on the joint ballot. The Republican Lieutenant-Governor, as President of the Senate, refused to grant the motion proposed by members of the Democratic majority, and attempted to recognize the thirteen Republican Senators as the Senate. He appealed to the Republican Governor for troops to support him in his position, but that official very properly refused to take any such action. The Democratic Senators had at their back the police of Denver, and a clash at arms was at first feared. The deadlock continued for several days, but the advantage from the first was on the side of the Democrats, who were united upon Senator Teller, the nominee of their State Convention, while the Republicans were bitterly at odds among themselves as to whether ex-Senator Wolcott should again represent them. Finally the official recognition of the Democratic Senate as the regular body, and the assembling of all the Democrats of both Houses within the Senate, made possible a joint ballot in which a bare majority of the Legislature

took part. Senator Teller received every vote, and ex-Senator Wolcott has recommended that this election be not contested by the Republicans. Nevertheless, the violence of the struggle and the near approach of anarchy have deepened the conviction that United States Senators, like Governors and Presidents, should be elected by the people instead of by the Legislatures.

❁

The New York Franchise Tax Unconstitutional

The decision of the Court of Appeals of New York that the franchise tax law of that State is unconstitutional because it delegates the assessment of the tax to State appointees instead of local tax officers gives current interest to the history of the enactment of the measure four years ago. As the bill first passed the Legislature at the close of the regular session, it provided for just such method of assessment as the Court now declares would have been constitutional. The manner in which it was changed to its present unconstitutional form was described as follows in The Outlook of May 27, 1899:

Governor Roosevelt has summoned an extra session of the New York Legislature under peculiar circumstances. The Ford Franchise Tax Bill, it will be recalled, subjected the property of gas companies, street railways, and the like to taxation in the same manner and the same amount as real estate. To this act not only the corporations interested, but the Republican machine, represented by Senator Platt, made strenuous objection. They demanded that the present method of taxing these corporations upon their gross receipts should be continued, and that in any event the proposed tax upon franchises should not be in addition to present taxes, and should be assessed by a State Board instead of local boards, as the Ford Bill proposed. These last changes Governor Roosevelt asks the Legislature to make. . . . The point made by the corporations, that the proposed tax on the value of their franchises should not be additional to present taxes, is fair; for, while these companies enjoy special privileges, the general demand of the public is merely that they shall pay the same taxes as other property-owners. Governor Roosevelt, therefore, will have public sentiment behind him in favoring the amendment demanded. When, however, he yields to the demand that a State Board instead of local boards shall assess this property, he makes a concession whose justification from the public standpoint is by no means clear. The street railways and gas companies of one city are less in competition with those of another than are manufacturers or even merchants. If the latter should be taxed by local boards at the general rate on local property, the former should be also. To give over the assessment of these corporations to a State Board prevents the treatment of this form of property as other property is treated, and removes the matter from the direct oversight of the people in the cities concerned.

The corporate influences which induced the Legislature to change the method of assessing the tax proceeded to attack the constitutionality of the act on the ground that it contained the provision they had recommended. The fact that the present decision seems to sustain the constitutionality of the act in every point except the method of assessment (two of the five judges sustaining it in every point) has led some of the supporters of the law, including its author, Senator Ford, and Comptroller Grout, to insist that the remainder of the act stands, and that local boards can proceed to assess the franchises covered by the act. This contention, however, is more than debatable, as the method of assessing the franchises was an integral part of the act as finally signed by the Governor. Instead of awaiting new court decisions upon points so difficult to sustain, it is best that all friends of equal taxation should concentrate their efforts upon securing a new law in line with the Court's decision.

❁

The Western Union vs. The Pennsylvania

Two conflicting decisions have been handed down by United States Circuit Courts in the suit brought by the Western Union Telegraph Company to prevent the removal of its poles and wires from the right of way owned by the Pennsylvania Railroad Company. The United States Circuit Court of the District of New Jersey has decided in favor of the telegraph company; the United States Circuit Court of the District of Western Pennsylvania has decided in favor of the railroad company. The former has enjoined the railroad from removing the telegraph company's wires and poles, while the latter has refused to grant such an injunction. The text of both decisions is before us, and the points of agreement and divergence are both interesting. It is agreed that the telegraph company has been renting the right of way of the railroad company since 1881, under a

twenty-year contract which contained this provision:

If no new agreement be made by the parties hereto, the telegraph company shall, at the termination of this contract or at any time thereafter upon receiving written notice from the railroad, remove within six months of the receipt of said notice all its poles and wires, and leave the property of the railroad in good condition and free from encumbrance, to the satisfaction of the General Manager or other proper officer of the railroad company, and if not so removed the railroad company may remove them at the expense of the telegraph company.

The Pennsylvania Railroad stands upon its contract rights, has made an agreement with the Postal Telegraph Company to place other lines along its right of way, and has ordered the Western Union to vacate the premises. The Western Union has declined to do so, and has obtained an injunction against the removal of its lines under the jurisdiction of the New Jersey court, upon the ground that Congress, in the statute of July 24, 1866, enacted that—

Any telegraph company now organized, or which may hereafter be organized, under the laws of any State, shall have the right to construct, maintain, and operate telegraph lines . . . over and along any of the military or post roads of the United States which have been or may hereafter be declared such by law . . . but such lines shall be so constructed and maintained as not to interfere with the ordinary travel on such military or post roads.

Inasmuch as all railroads are by Federal statute declared to be post roads, the New Jersey court holds that the Western Union Company, which accepted the restrictions and obligations of this statute, is thereby given a right of eminent domain to construct lines along the right of way of the Pennsylvania Railroad, and since the removal of its present lines prior to the construction of new ones would work irremediable damage to the telegraph company, the court intervenes to prevent such removal. The Pennsylvania court denies that the act of Congress confers upon telegraph companies any such sweeping rights of eminent domain to use the right of way of railroads, and points out that in the contract of 1881 between the Western Union and the Pennsylvania Railroad, the telegraph company expressly "relinquished and abandoned any easement or right of way heretofore acquired . . . upon any of the roads comprised in this agreement," and expressly agreed that its right of way should cease with the expiration of the contract. The Pennsylvania court holds that the telegraph company cannot now claim a right which it thus formally abandoned, and grants the railroad the right to proceed with the removal of the telegraph company's lines. The case will, of course, be appealed to the higher courts, and a decision reached as to the extent to which the public interest in the maintenance of unhampered telegraph communication gives telegraph companies the right of eminent domain in the use of the property of a railroad.

Public Rights in the Telegraph

It is interesting to note that the Federal legislation under which the Western Union Company claims to have been delegated the right of eminent domain includes the following provision:

The United States may, for postal, military, or other purposes, purchase all the telegraph lines, property, and effects of any or all companies acting under the provision of the Act of July 24, 1866, . . . at an appraised value to be ascertained by five competent disinterested persons, two of whom shall be selected by the Postmaster-General of the United States, two by the company interested, and one by the four so previously selected. [U. S. Revised Statutes, 5267.]

It is not generally known that the right of the Government to purchase the telegraph lines has for a generation been so explicitly established. The special interest to the public of this litigation lies in two points: first, that it brings out very distinctly the public function of the Western Union Company; and, second, that it makes manifest the right of the public to take over by purchase and manage the telegraph as it manages the post-office. In the opinion of The Outlook, if the business of any private corporation or trust is to be taken and operated by the Federal Government, it might well be that of the telegraph trust.

The Coal Famine Investigations

The coal famine was unrelieved last week, though despatches from England announced the sailing of several vessels loaded with coal for America, and in this country miners, operators, and railroads

professed to be bending every energy to increase the supply of coal in the needy markets. In the testimony before the Coal Commission responsibility for the present limited output was the point of keenest interest; the operators arraigned the miners for unwillingness to work overtime, and the miners arraigned the operators for unwillingness to employ two shifts of workmen, and the railroads for failure to furnish sufficient cars. The fact that the miners get no advance in wages by reason of the great advance in prices is held by their friends to absolve them from the charge of desiring to maintain the scarcity, but the accusation of President Mitchell that the operators are still keeping three thousand miners unemployed is vehemently denied by the operators and not credited by the public. The most extraordinary feature of the present panic for coal is that it has its greatest intensity in the soft-coal States. In the soft-coal-producing State of Ohio the Governor was last week compelled to issue a proclamation to repress the coal riots at Xenia; in the soft-coal-producing State of Kansas a resolution was introduced into the Legislature calling for an investigation of the famine there; and in the soft-coal-producing State of Illinois—which ranks next to Pennsylvania as a coal State—the Attorney-General announced that a legislative investigation of the famine would be recommended after the special Grand Jury in Chicago had reported on the famine in that city. The report of the Chicago Grand Jury was given to the public last week, and is eminently moderate in its tone. The Grand Jury finds that Chicago has not suffered more than other places, that the coal shortage is mainly due to the falling off of 25,000,000 tons in the year's production of anthracite, and that the railroads have been unable suddenly to increase the number of coal cars so as to transport fuel as rapidly as the present situation requires. Nevertheless, the Grand Jury also finds that the "Northern Illinois Soft Coal Association," the "Retail Coal-Dealers' Association of Illinois and Wisconsin," and "a certain combination of Indiana coal operators" have violated the laws against conspiracies in restraint of competition, and it has presented indictments against them. The indictment against the Retail Dealers' Association is the most formidable. Among the eight counts in this indictment are the charges that the Association "fixed a minimum price on their wares and forced that price upon the consumers of this State and of Wisconsin; that they agreed to prevent wholesalers from selling direct to consumers in furtherance of the upholding of their own price agreements, and declared against those of the wholesalers who failed to recognize this pledge." If dealers thus acted together, while consumers acted separately, each bidding against the other, the abnormal prices do not require further explanation. It is, however, a striking example of the failure of consumers to act together that the American people are this year paying a great deal more for a short supply of coal than they usually do for a full supply. There would, indeed, have been no occasion for a panic if the supply had been evenly distributed. In 1901 this country produced 261,000,000 tons of coal. Even when we reckon that one ton of hard coal goes as far as two tons of soft, the falling off in the supply this year was not more than one-eighth. The coal stored in yards and bins at the beginning of the strike was nearly enough to have offset the deficiency. It was only the feverish anxiety of everybody not to be left in the lurch that made the present panic and extortion possible.

❀

The Trial of Colonel Lynch

Last week at London occurred the trial of Colonel Arthur Lynch, member of Parliament for Galway, on the charge of high treason. As may be imagined, the occasion was one of deep impressiveness. It is sixty-odd years since an Englishman has been on trial for high treason. The defendant at that time was the lunatic who tried to shoot Queen Victoria and Prince Albert on Constitution Hill. Colonel Lynch was born in Australia, is a British subject, but in 1900 took the oath of allegiance to the Transvaal and issued his appeal to Irishmen to fight for the Boers. He himself fought against the British at the head of an Irish brigade, and prosecuted spies with all the rigor of martial law. When the war was over, he again professed to be a British citizen, and

was elected to Parliament by the pro-Boer Irish. The trial began last week before Lord Alverstone, Lord Chief Justice, and two other Justices. The prisoner pleaded "Not guilty." After Sir Robert Finlay, the Attorney-General, had recited the alleged treasonable acts, counsel for the defense submitted that the prisoner was protected by the naturalization laws, that a man was entitled to become an alien at any time, even after the outbreak of war, that Colonel Lynch took up arms in behalf of the Transvaal without secrecy and under the belief that the Naturalization Act permitted it. Sir Robert Finlay, on the other hand, argued that Colonel Lynch procured naturalization for the purpose of fighting against his own country, and added that, even could naturalization cover the prisoner's subsequent action, it could not cover his anterior treason—the adherence to England's enemies, and the statement of his willingness to fight against Engla d's army. The Lord Chief Justice, in summing up, said that the case involved no difficulty either of law or fact. It was treason to join the enemies of the Sovereign for any purpose. The jury returned a verdict of guilty, and the sentence of death was passed on each of the four counts in the indictments. It is believed that the sentence will be commuted; but the King's clemency will in no way change the conviction of most Englishmen that the prisoner was proved to have been a traitor in both letter and spirit, particularly since, as is reported, there is no record of any formal renunciation of British citizenship or of any formal naturalization in the Transvaal. The charge would probably not have been brought if Colonel Lynch had not had the effrontery to stand for Parliament.

❁

Education in China Not even the repeated rumor that General Tung, with the Mohammedan province of Kansu behind him, had taken up arms against the Chinese Government was so interesting last week as was a confirmation of the report that Yuan-Shi-Kai, Viceroy of the metropolitan province of Chili, had offered to pay the expenses of about sixty Chinese students in the Military School at Tokio, Japan, realizing, as he says, that compulsory education in foreign learning for the officials is one of the two great needs of China at present, the other (and, to our mind, more important) being elementary education for the masses. This opinion is also reflected in a recent address by Mr. C. S. Addis before the Educational Association at Shanghai. "The China pony," he remarked, "is endowed by nature with a courage and endurance second to none. It has required, however, a long course of foreign training to develop the added powers of intelligence and swiftness which make him a formidable competitor on any racing field." The same training is necessary with the Chinaman. The native good qualities are there—sobriety, frugality, patience, industry, adaptability; but, despite these, there is both inefficiency and waste of Chinese labor; "as compared with European it is as one to three." The Chinese lack the capacity to combine their good qualities and apply them to modern industrial conditions; as Mr. Addis says, "the power of mental concentration is wanting." The conviction which has taken hold of enlightened native officials and foreigners alike has borne fruit, not only in the sending of young Chinamen abroad, but also in the opening of primary and intermediate schools at home. Prefectural schools are to follow; but a higher grade, namely, the university, has already been established, not only at the Peking Imperial University, but also in the provinces of Shantung and Shansi. The great problem of the universities, of course, is to obtain competent foreign professors to teach in Chinese, or to obtain Chinese professors who have mastered the leading branches of foreign learning. In preparing China for all this educational renaissance a principal agency has been the "Society for the Diffusion of Christian and General Knowledge among the Chinese," of which Sir Robert Hart, Imperial Director of Maritime Customs, is President, and Mr. Addis, whom we have already quoted, is one of the Vice-Presidents. Whatever harmony of progress there now exists between China on the one hand and Europe and America on the other is largely due to the wise and persistent endeavors of this Society. Its members realize that foreign diplomats and merchants alone cannot succeed in bringing China into line with more civil-

ized ideals. The Society justly claims that nine-tenths of the increased knowledge which the Chinese have recently obtained, and no less than ninety-nine per cent. of all the modern schools there, up to the last few years, are due to the missionary. But even the missionary cannot solve the present question; it must be done by the Chinese themselves as educated by the leaders of the world's educational systems.

❀

The American Institute of Social Service

In a very interesting article called "The Best of Paris," published in last week's issue of The Outlook, the author, Mr. Carl S. Vrooman, after praising the Musée Social as an invaluable institution, expressed the belief that "a virile, scholarly, and constructive institution of the sort will one day be established in our country to boil down and popularize, supplement and stimulate, the work of our present Bureau of Labor Statistics." Such an institution now exists, has already done excellent work in this direction, and has of late largely increased its scope and plan of usefulness. The American Institute of Social Service, in a charter granted it last month by the Regents of the University of the State of New York, defines its object as "the collection and interpretation of facts bearing on social and industrial betterment and the dissemination of the resulting knowledge for the education of public opinion." The Institute is an expansion of the League for Social Service, which was founded some four years ago. Since that time it has been accumulating material, and, as we have heretofore told our readers, has put itself in touch with social needs on many sides. The aims of the Institute are identical with those of the League, but it will have additional departments and a more ample equipment throughout. Its organizing committee was headed by the late Abram S. Hewitt, and includes many men and women of influence, of whom we may name a few only. Among the men are Carroll D. Wright, Spencer Trask, Robert C. Ogden, Albert Shaw, Jacob A. Riis, R. Fulton Cutting, Josiah Strong, and W. H. Tolman; among the women, Miss Helen Gould, Grace Dodge, Miss Caroline Hazard, Mrs. Mary L. Dickinson, are representative names. The Institute is in close touch with the Paris Musée Social, and has established other international relations of great value. The Director, Dr. William H. Tolman, will spend part of the coming summer in the principal cities of Europe gathering material relating to such subjects as improved housing, settlements, playgrounds, public baths, and other developments of social economy of European cities and countries. The Institute will issue Social Service handbooks describing societies and institutions occupied with charity, recreation, art, education, improved houses, and the like; will send out a bi-weekly letter service to hundreds of newspapers describing and interpreting new movements; will provide for illustrated lectures; will continue to carry on its commercial membership section in which are interested many of the most important and foremost establishments of the country; and in many other ways will act as a center and clearing-house of social economy. The public service which may be rendered by such an institution can hardly be overestimated; and its opportunity for increasing this service is limited only by the support it receives from the public.

❀

The Pennsylvania Academy of Fine Arts

The Outlook has already called attention to the annual exhibitions of the Pennsylvania Academy of Fine Arts as constituting a genuine American Salon. Through the remarkable energy and tact of the managing director, Mr. Harrison Morris, these exhibitions have come to be representative of all that is best in the various departments of painting, pen-drawing, illustration, and sculpture among American artists, whether at home or abroad. The Pennsylvania Academy, as the oldest institution in America devoted to the fine arts, seems thus to have resumed its original leadership, and this not only because of the compelling excellence of its exhibitions and of its training-school, but also because it has gained in a peculiar degree the confidence of the entire American artist body. It certainly is a relief from the divided and subdivided exhibitions of Paris and New York to find one showing of pictures which is at once comprehensive, representative, and really National in its char-

acter. The present exhibition at Philadelphia, which will continue until the end of February, should be distinguished from its predecessors and from others because it seems to mark the declining interest taken by the public in that department of painting which we know as *genre*. The examples of this department are notably few in number as compared with those which have crowded the walls of picture shows for the past generation. The public has finally tired of whatever has been meretricious in the genre school of overemphasized millinery and upholstery, and there has been a correspondingly increasing interest taken in landscape painting—not in the hard, metallic, photographic reproduction of actual scenes, but in the evanescent, atmospheric aspects of nature, those which give greatest play to the imagination. Finally, the noble art of portraiture has gained steadily in influence and in vogue, so that not only are American artists overwhelmingly occupied with orders, but every year witnesses the coming to our shores of a notable group of foreigners who find here their most profitable employment. In the present exhibition the works of such men as Messrs. Alexander Harrison, Winslow Homer, Gedney Bunce, and Charles Morris Young, for instance, indicate the fineness and variety of perception of painters of nature, whether on sea or land, and in portraiture the canvases of Messrs. Whistler, Sargent, Alexander, Chase, Tarbell, Benson, Abbott Thayer, Irving Wiles, Miss Cassatt and Miss Beaux. As indicating the wealth of output behind each name represented at the Philadelphia Academy, we may add that there are there no less than six pictures apiece by Mr. Whistler, Mr. MacEwen, and Mr. Harrison, four by Mr. Sargent, five each by Mr. Chase and Mr. Tarbell, seven by Mr. Alexander, and twelve each by Mr. Palmer and Mr. Winslow Homer.

Julian Ralph

Julian Ralph, who died in this city on Tuesday of last week, belonged to the group of men who have been developed by the exigencies and opportunities of modern journalism. Mr. Ralph was what is known as a Special Correspondent; a trained man of great quickness of resource, courage, and capacity, who could be sent at any moment, to any part of the globe, to report a war, a plague, a revolution. The intrepidity of the Special Correspondent in the wars of the last thirty years has been quite as great as that of the bravest soldiers. Their exploits of this kind have rarely been recorded; but the story of their heroism, energy, and triumphs over obstacles forms one of the most romantic chapters in recent history. Mr. Ralph was the son of a physician, born in New York, educated in the public schools; he entered a printing-house at the age of thirteen, and two years later had attracted attention by reason of the excellence of his descriptive work. After acting as editor of several short-lived or out-of-town newspapers, Mr. Ralph came to New York in 1870 to join the staff of the "Daily Graphic." His work had so much individuality and vividness that its quality was at once recognized, and Mr. Ralph was invited to join the staff of the New York "Sun," a position which he held for about eighteen years, representing the newspaper in different localities, and intrusted with important and difficult commissions. During the last eight years he had various newspaper connections. He represented the London "Mail" in the Turko-Grecian war, and two New York newspapers in London during the Jubilee of Queen Victoria; he was the representative of various London journals during the Boer War in South Africa, and he participated in the campaigns of Lord Roberts and General Methuen. He had traveled widely in China and the Black Sea region, and was the author of a number of books of travel and observation and of two novels. Personally Mr. Ralph was a very interesting talker; fresh, frank, original, full of special knowledge of remote localities and peoples, with an immense interest in life. His enthusiasm was the joy of his friends. He was always "discovering" commonplace things or familiar localities again. It used to be said that he found Tompkins Square at least once a year, and that he more than once discovered City Hall in this way. "Discovery" meant to him a new look at a building or a locality, a new feeling for its human interest or its charm, and an immense zest in his enjoyment of beauty, of novelty, or of significant types.

Wireless Telegraphy The first actual message by the wireless system between the United States and England was sent last week in the form of a complimentary and congratulatory despatch from President Roosevelt to King Edward. The distance from the Cape Cod station to that at Poldhu in Cornwall is about 3,000 miles—600 miles further than that between the stations at Poldhu and Glacé Bay. Oddly enough, the actual sending of the message was inadvertent: Mr. Marconi was practicing with it on the apparatus at this end, not supposing that the apparatus at the other end was in readiness, when he received a report via Glacé Bay that President Roosevelt's message had been received in England. Mr. Marconi is confident that the system will be ready for commercial use within three months. The Poldhu plant's power is to be increased to equal or exceed that at Cape Cod, and then a regular service will begin. The inventor thinks that reduced rates for transoceanic messages will follow. Great as is the triumph of sending a message 3,000 miles, it bids fair to be surpassed before long by wireless "connection" between England and South Africa, and even between Italy and Argentina (6,000 miles). For the last the King of Italy has been building a power station to have five or six hundred horsepower—more than ten times that of the Cape Cod station—and Mr. Marconi hopes for positive results within a month or two.

❁

Episcopal Elections Last week, in the Protestant Episcopal dioceses of Mississippi and Newark, N. J., events occurred of an interesting nature to the whole country. In the first diocese, to succeed the lamented Hugh Miller Thompson, the Rev. Dr. Arthur S. Lloyd, General Secretary of the Domestic and Foreign Missionary Society, was elected on a first ballot. If Dr. Lloyd accepts the office to which he has been called, the Missionary Society will lose an officer whose consecration, enthusiasm, and notable tact have gained for him a high place among missionary organizers, but the bench of Bishops may be proportionately congratulated by the addition of one who in every way would add honor and worth to it. Dr. Lloyd is forty-five years old. He is a Virginian, and received his education at the University of Virginia. He devoted himself immediately to missionary work in the sparsely settled northern districts of his own State, where he labored with signal success. In 1885 he was called to St. Luke's Church, Norfolk, to take up the work begun by the late Bishop Newton. Three years ago Dr. Lloyd accepted his present post. To any position to which he may be called Dr. Lloyd will carry the influence of a peculiarly genial and forceful personality, together with a breadth of view which has already made his influence felt outside the bounds of his own communion, particularly in the work of the Young Men's Christian Association.—— In the diocese of Newark last week a convention was held to elect a Bishop-Coadjutor to the venerable Bishop Starkey. The candidate of a majority of the clergy was the Rev. Dr. Fiske, of Providence, R. I.; that of the majority of the laity, the Rev. Dr. Mann, of Orange, N. J. After a lengthy session, as there seemed little prospect of agreement, adjournment was had until next May. The occasion is of interest to all Christians as indicating a possible change in the proportionate influence both between clergy and laity and between the High and Broad Church parties.

❁

Methodist Reunion A recent meeting of more than usual significance was that of the Joint Hymnal Commission of the Methodist Episcopal Church and of the Methodist Episcopal Church South, at Nashville, Tenn. While for several years there has been a movement on foot to bring the two Churches nearer together, this would seem to be a definite step, particularly as a common hymn-book has been authorized and a Commission appointed to prepare it. Among the Commissioners are Bishops Goodsell and Hoss, the Rev. Drs. Stuart and Winton, Professors Winchester and Mims. The meetings of the Commission were characterized by great cordiality, and the progress made was entirely satisfactory. About four hundred hymns have already been agreed upon, most of them the standard hymns of the two Churches, along with a goodly number of the best modern productions. The Commission expects to complete its work in

July; and the resultant good may far transcend the immediate purpose in view, perhaps leading to a federation of the two great branches of American Methodism, and thus undoing the work of half a century ago. At all events, the Nashville meeting is only another evidence of the disappearance of sectionalism from American life.

❁

Dr. Hall as Haskell Lecturer in India

Following the late Dr. John Henry Barrows and Principal Fairbairn, Dr. Charles Cuthbert Hall, President of the Union Theological Seminary of New York City, has been delivering the University of Chicago Haskell Lectures in India. He has delivered the full course in Calcutta and in Lahore, besides giving part in Colombo, Benares, and Allahabad. According to the conditions of the lectureship, the remaining Presidency cities, Bombay and Madras, will also be included in his itinerary. He has drawn large audiences of students and of educated Hindus, who are more eager than ever before to listen to the presentation of Christianity by leading preachers and theologians of the West. In some of the places which Dr. Hall has already visited he has drawn the largest local audiences that have ever been gathered there, and, quite significantly, in steadily increasing numbers for the six successive evenings. The general subject of the lectures is "Christian Belief as Interpreted by Christian Experience," set forth under the topics, The Nature of Religion, The Christian Conception of God, The Lord Jesus Christ the Supreme Manifestation of God, The Sin of Man and the Sacrifice of Christ, The Ideas of Holiness and Immortality Interpreted by Christian Experience, and Reasons for Regarding Christianity as the Absolute Religion. The sympathetic appreciation of all that is good in their religion and the eloquent personal declaration of the facts and significance of Christian experience have been appealing forcibly to the earnest seekers after God in India. In Calcutta Dr. Hall had the privilege of baptizing a young man of high standing who had been led to decide to become a Christian by the hearing of the lectures, and the sentiment of not a few of the Hindus probably was voiced by one who said in words of thanks, "Up to this time I supposed I could be overcome only by mind. Now I know that love conquers. You have won us by love." In Lahore, where at the close of the course the published lectures were first offered for sale, the entire temporary supply of 150 copies was taken at the door before all the audience had left the town hall. Leading representatives of college students, of Hindus, of Mohammedans, and of each of the reform movements in Hinduism, have sought and obtained separate private interviews. Everywhere, Dr. Hall has received cordial welcome, not only on his own mission, but also as a representative from America, whose substantially sympathetic aid to India during the recent famine and through missionary education was frequently recalled with deep gratitude in the addresses of welcome and of thanks. In many ways Christianity is being attractively and efficiently presented to India, and the admirable general work of the missionaries is being admirably supplemented by the special work of such men as Dr. Hall, who are being sent out from time to time.

❁

District Attorney Jerome

There are some thoroughly honest and well-meaning people who have been disturbed, if not shocked, by the methods employed by District Attorney Jerome in his fight with political corruption during the first year of his term of office. We think most of these well-meaning critics of the District Attorney understand neither the platform upon which he so courageously stood during his memorable campaign of 1901, nor the motives which are directing him in the conduct of his office, nor the results which he is seeking to accomplish. The Outlook approved of the candidacy of Mr. Jerome, and rejoiced in his election, because it believed that he was introducing into practical politics an element which is too rarely found in that field of human activity.

Every reader of the story of his campaign—which is now appearing serially in The Outlook—must have recognized what this element is. To find out the

actual facts for himself, and to tell the public the naked truth about them, has been Mr. Jerome's animating purpose from the day he was nominated until now. He counts neither personal nor political expediency. Now that the smoke and fury of the political battle in which he fought so important and victorious a part have passed away, we think it is well to set down calmly and quietly the record of that contest, and to ask our readers to consider it and what it means. This is the reason why The Outlook is publishing "A Fight for the City." In our opinion, what Mr. Jerome did during his campaign he is still faithfully and courageously doing as a public official. He is not attempting to exterminate gambling or prostitution. He *is* attempting, and with a remarkable degree of success, to crush out the corrupt and debasing alliance between city officials and vice and crime. The power of the law can never make vicious men virtuous, but the power of public opinion, supporting public officials, can prevent the Police Department, the Health Department, the Building Department, the Tax Department, and the other executive branches of the municipal government, from sharing with the vicious the profits of their vice. When the District Attorney raids a gambling-house like that popularly known as "Canfield's," he does it, not primarily to punish Canfield, but to show the public that the officers they employ and pay to prevent confidential clerks from squandering their employers' property and rich men's sons from losing their patrimony over the roulette-wheel, not only wink at such proceedings but encourage them. Any public man who does his duty courageously in attacking a public evil will be misunderstood, misrepresented, and even maligned by those from whom he ought to receive encouragement and support. Mr. Jerome knows this, and bears the burden without complaining. Nevertheless, the real work which he is doing ought not to be obscured by the specious argument of his enemies—who are enemies of the public welfare—that he is simply driving criminals from one block to another, and that the law must wink at vice because it cannot suppress it. We have the right to believe that we are speaking for Mr. Jerome when we assert that he is not fighting the gambler, the liquor-seller, or the prostitute. When they obstruct the real work which he is doing, they will inevitably get hurt, as in the case of Canfield. His chief, we may almost say his sole, purpose is to put a stop to official blackmail.

To what gigantic and horrible proportions this system of official blackmail has grown in this city the story of his campaign clearly indicates. Let those honest critics to whom Mr. Jerome's methods seem so radical as to be undignified, carefully read his mind and purpose as indicated in the graphic story told by Mr. Hodder, and we think they will agree with us that the District Attorney should have from every good citizen constant and cordial support, as one who has done more than any other single individual to make the public appreciate the need in New York of a fearless and incorruptible administration of the law.

❀

Selling and Giving

The character of the great congregation which filled Calvary Church, in this city, on the occasion of the funeral of Mr. Hewitt, on Wednesday of last week, bore impressive testimony to the range and variety of his interests. The church was crowded with men, and not often in any assembly are to be found so many men of advanced age. Universities, colleges, schools, the arts, religious organizations, all the leading clubs, and innumerable financial organizations, were represented by their leaders. There were faces familiar to the public in almost every pew in the church. Foremost men of the city were among those who stood with the family of Mr. Hewitt about his coffin. It was an assemblage which evidenced something more than prominence in social and civic affairs; it bore striking testimony to the energy and generosity of Mr. Hewitt's nature, to the multitude of things for which he cared.

Science determines the rank of a living creature by the number and complexity of its relations to its environment. If these relations are few and rudimentary, the living thing is rudimentary; if they are many, complicated, and intricate, the organization which sustains them moves up in the scale of life. Man is at the head

of all created things because he has the greatest number of relationships with his environment; and among men, rank is to be determined by the same test. The rich, highly organized, fully developed nature stands in manifold relations to its environment. Such a nature has a great variety of interests—physical, social, political, intellectual, moral, and spiritual. It touches life on every side, its energy flows out through a thousand channels; and when such a man is withdrawn from the sphere of mortal action, there is a widespread feeling that life has been impoverished. There are thousands of people to whom life has never been as rich since Phillips Brooks went out of it; and some one has said with truth that New York seems lonely without Mr. Hewitt.

No man can call together the representatives of so many forms of human activity, of so many organizations, representing such widely different interests, unless he has been a generous spender. The man of niggardly nature, of parsimonious spirit, who husbands his resources and saves rather than gives, is always solitary, and his departure means little either to his friends or to the world; but the going of a great giver is like the drying up of a river. A man is great because he has capacity for assimilation, for taking to himself the force of his own time, for appropriating the accumulations of the past; and because he has the capacity for immense bestowal. The man of energy is a great giver. He may not always be lavish with his means, but he is always lavish of himself. To whatever he touches in the manifold relationships of life he gives something of his own spirit, the impulse of his own power, the inspiration of his leadership.

A man's place among his fellows is determined by the relation between the things that he gives and the things that he sells. Every man has a right to sell, at the best price he can secure, his time, strength, knowledge, and talent; but every high-minded man gives more than he sells. Every great leader carries to his work his temperament, his power of devotion, his character, and his genius, and these no man can sell. The country can pay Abraham Lincoln a certain salary; but, whether that salary be large or small, no country can pay for the services which such a man renders, and such a man cannot sell those services; he must give them. What makes his service priceless is the fact that it could not be bought or sold. It was a free gift. A great painter like Michael Angelo may receive large sums for his work; but he cannot sell, and the world cannot pay, for that view of life, that force and distinction of nature, which reinforce the technical skill and give the work as a whole its splendid significance. Mr. Gladstone had a right to sell his time, his talent, and his strength; but England did not and could not pay for such a service as Mr. Gladstone rendered. The people who listen to a preacher like Phillips Brooks ought to make ample provision for his comfort and ease, because freedom from care of material things provides the conditions for the highest efficiency of such a spirit; but no congregation could pay for the service which a Phillips Brooks renders to the people who hear him and to the community at large.

Great natures are always generous; they are fountains, not only of vitality, but of bestowal. However great the rewards they receive may be, these rewards are but a fraction of the worth of the service rendered; and no man ought to be satisfied, whatever his position or work, unless he can feel that he is giving far more than he is receiving; that a very large part of what he does is not returned in money; that, however successful he may be on the practical side, he must still be counted one of the benefactors of his kind because of the generosity of his bestowal.

❁

The Certitude of Immortality

To the Editors of The Outlook:

Several months ago one of your reviewers, in commenting upon some religious book, by Farrar, I think, took occasion sharply to criticise the writer for maintaining that Christ's resurrection is our only proof of the "universal certainty of immortality" (or some similar expression). I now write to ask you on what grounds you *speak so certainly of immortality independently of revealed religion.* I must admit that I am sometimes horribly depressed by a lack of conviction on this matter, when I feel the weight of scoffing skepticism without—with its assertion that life is merely a chemical process soon to be discovered—and when

doubt begins to gnaw within. As a matter of fact, many men seem to doubt immortality, and if there is some unanswerable argument in support of this "universal certainty," those who possess it should advertise it far and wide. X. Y. Z.

Reserving to the last the most important consideration, one may clear the way to a reasonable conclusion by observing where the burden of proof rests. Two views compete. One holds that mind is a function of the body. The other holds the body to be the organ of mind. Which of these is the more reasonable must be judged in view of the achievements of mind—organizing out of nervous sensations the conception of an orderly universe, weighing and analyzing the stars, yoking to work the titanic forces of the world, creating art, literature, and religion. If, as all this indicates, the body be the organ of mind, the burden of proof rests on those who say that the end of the organ is the end of the organist.

One should allow for the important distinction between the assurance based on mathematical demonstration and the assurance based on rationally discerned probabilities. To the former belongs our knowledge of the cosmic law of gravitation; to the latter our practical judgment in the conduct of life even in its greatest exigencies. In these the utmost that we require is a reasonable rather than an incontrovertible assurance. We are also to bear in mind that even the exact sciences, as well as the reasonable conduct of life, are both at bottom based on faith, faith in the truthfulness of nature, faith in the perceptive and rational faculties of mind.

Those who seek for philosophic "proof" of immortality are not content with historic facts, however strong they may be as witnesses. They desire to find ground for believing that life survives beyond the grave in phenomena which life exhibits here and now. Such ground is discoverable. A species, a type, of life exists in the present world which reason cannot without stultifying itself pronounce destructible by the death of the body.

This world exhibits two types, two grades, of life, whose distinctness is demonstrated by the opposite modes of their development. To recognize this is of pivotal importance in the discussion of the subject. The first is the animal life, developing itself by its struggle to appropriate and possess this world in the survival of the fittest. The second is the moral life, developing itself through sacrifice of this world in order to fit itself to survive this world. History exhibits through the ages a multitude turning their backs on allurements of a transitory nature in preference for a good which they deem eternal. The entire record of moral and religious progress is the record of this victorious struggle of moral nature against the most imperious demands of animal nature.

The question at issue is, Does this victorious energy proceed from a fond illusion, and rest on no more substantial basis than a dream?

Frederick the Great is said to have asked his chaplain for clear evidence of the truth of Christianity, and, to save time, in the fewest words. To which the chaplain replied: "The Jews, your Majesty." To a demand for evidence of immortality both convincing and brief, one may simply answer: *The martyrs.*

When one of that glorious company prefers to lose life rather than virtue, some raise the question: Does he keep his virtue any longer than he keeps his breath?

The affirmative answer rests on the axiom, respected alike by Science and Philosophy, that Nature never lies. Unless we can trust Nature, there is nothing in the universe to trust.

The primary instinct of life is self-preservation. We trust it amid floods that threaten to drown the body. It is equally trustworthy amid perils that threaten to pollute the conscience. In each case it points to reality, to a possible good as conditioned on the struggle it prompts to. Its conditional promise of that good cannot reasonably be regarded as more illusive in the one case than in the other. The self-preserving instinct of the moral life, that bids parting with the body for the keeping of conscience, is at least equally veracious with the similar instinct of the animal life, that bids the shipwrecked swimmer throw away his bag of gold in his struggle for the shore.

We must believe, then, that though the steadfast martyr loses his body, he keeps his virtue. But he cannot keep it unless he keeps the life from which his virtue is inseparable, without which *his* virtue would be but a name, a memory of something

vanished from existence. Were this not so, the noblest type of life would be the most deceptive. If the defeated animal instinct to save his body from the flame pointed to a more substantial good *for him* than did the victorious moral instinct to save his virtue from stain, no rational account could be given of the action of what is most heroic and divine in human nature.

One who is not prepared at once to admit the full force of this argument must at least recognize its preponderance of rational probability. Outside of mathematics there is no problem in which judgment is not determined by the balance of probability.

On precisely similar grounds of pure reason science holds the otherwise indemonstrable cosmic ether to be a reality, affirming, with Professor Tyndall, that it is a postulate of reason for a rational explanation of the action of light.

We have found thus exhibited in the present world a type or grade of life whose demonstrated independence of this world assures our reason of its exemption from the evanescence of this world. Those who are skeptical of the fact are so in part, at least, through neglect to study the phenomena that attest it.

This remark suggests what, after all, yields the supreme assurance of immortality, to which the foregoing considerations are merely subsidiary. Cicero observed in heathen Rome a fact which also should count for much with those whose judgment is determined by the rational probabilities of the problem. This is, as he said, that the presage of a future life roots itself deepest in the most exalted souls. The highest certitude of it depends on one's cultivation of the moral and religious life which is the sole and sufficient witness of it. He whose reason cannot penetrate the cloud of doubt cannot borrow this certitude from another; the inward conviction is incommunicable. He must create within himself the soil of the Christly life to which it is indigenous. As in Jesus, so in those who follow him in cultivating life of the divine type, that life bears convincing testimony of itself. It can say with Jesus, "*I know* whence I came, and whither I go." On such a life only a blind materialism can write at the grave,

> "The forces that were Christ
> Have taken new forms and fled."

The world it has overcome can bring it to no end, but only to that world to which its struggle attests that it belongs.

The Impressions of a Careless Traveler

VII.

April 15.

WE came back last night tired of a four days' land trip to Tiflis. The illustrated circular describing the tour of the Prinzessin, which was forwarded to us before we started, thus locates and describes this city:

"Batoum is one hundred and ten miles northeast of Trebizond, its harbor being the safest on the east coast of the Black Sea. . . . Opportunity is given to visit by rail from this point Tiflis, the capital and largest city of Caucasia, a half-European, half-Asiatic town, aptly described as a city of contrasts, Cairo alone presenting a similar mixture of Oriental poetry and decay, with some of the humble types of European society. It consists of a Russian quarter, with ambitious buildings of the modern style, a clean and picturesque German suburb, and a Persian district with a decidedly Eastern aspect. Tiflis was first made a capital in 455 by Wakhtang, a Georgian chieftain, who erected a fort and several churches. It was subsequently occupied and plundered, devastated and rebuilt, by Persians, Greeks, Saracens, Turks, etc., till 1795, when Russia, in order to protect it from the Shah of Persia, took it and has kept possession ever since. Tiflis has a population of over 100,000, among whom are 8,000 artisans renowned as silversmiths, gunsmiths, and sword-makers. Of its fifty-four churches, the Cathedral of Sion traces its origin to the fifth century."

At Batoum we entered Russia. Here we had our first experience of the Russian Government. Prior to Constantinople our passports were not asked for. At Con-

stantinople we were directed on landing to go to an office at the Custom-House, where they were viséed—*i.e.*, stamped—by an official, without charge to us. This was so much a pure formality that I passed by the office, had my hand luggage examined, and could have passed on had not a friend suggested that I might have difficulty in embarking if I did not have my passport viséed. In fact, however, it was not looked at again. In Batoum it was quite different. All our passports were gathered up by the steward. Russian officers came on board to examine them. We had to go in person to the library to get them. Two of our fellow-passengers, seeing theirs on the library table, and jumping to the conclusion that all was done, took them up and went off, and after we all got on shore the train was delayed ten or fifteen minutes until the proper officer could be hunted up and the passports viséed. This incident emphasizes my impression of the difference between the Russian and the Turkish Government; it is matter of feeling largely, but as I find it shared by others of our passengers, I think there must be some basis of fact for it. In Turkey there is no real government. Official position gives prerogatives and powers, but involves no duties. There are despotic powers, but no organized power. Foreigners are protected by their flag and have their own consular courts of justice; but a native is at the mercy of any man who is stronger, more cunning, and more unscrupulous than himself. Neither person nor property is really safe in Turkey. In Russia there is a strong bureaucratic government. It is thoroughly organized. It protects person and property. I am inclined to think that both are quite as safe in Russia as in America, so long as one is not *suspected* of being hostile to either Church or State, which are practically one. If he is under suspicion of hostility to either, he has no assurance that he will have any trial, or even know of what he is accused. I would much rather live in Russia than in Turkey, but I should want to be both "orthodox" and imperialist, and as I am neither, I should never be quite easy in Russia.

Batoum is the port from which most of the oil from the Russian oil-fields is shipped to European ports, and enough of it escapes in the shipping to furnish a very evident covering to the water of the harbor. Perhaps this is what makes it the safest harbor on the east coast of the Black Sea. We met here on landing the American Consul, who was an old acquaintance of one of our passengers. Report has it that his consul fees amount to $300 a year, and his salary from the Standard Oil Company to $25,000 a year. It does not seem to me felicitous to employ as our ill-paid representative so well-paid a representative of a great corporation, whose interests might very easily, in certain conditions, be quite different from those of the United States or one of its private citizens. [But later the Consul at Odessa told me that Mr. Chambers's reports were noteworthy, and had been translated into Russian, and I think he said also German.] We saw Batoum only from the car windows. For on landing we went direct to our train, and, after the delays which appear to be indispensable in all Eastern countries, we started on our thirteen-hour railroad ride to Tiflis.

The special train arranged for by Cook, under whose guidance all the passengers placed themselves in the Black Sea excursions, was a corridor train—that is, it was composed of cars each of which was divided into compartments running across the car, and a hallway running the full length of the car along one side of it, on which these compartments opened. We four, with two fellow-passengers very congenial to us, secured one of these compartments, and made ourselves very comfortable. Each of the two long seats, facing each other, had an upholstered back which could be turned up over the seat so as to make a bed, thus converting the compartment into a sleeper with four beds, each of which was long enough to make it possible for two short people to sleep in it, by either curling up a trifle or by overlapping a trifle. As evening came on, we turned up one of these beds, and two of our number climbed up into it, while the rest, in various attitudes, composed ourselves to rest, and perhaps to sleep, on the seats or couches below. There were two dining-cars on the train, quite different from ours, however. A long table ran the whole length of the car, and on it a table d'hôte lunch and dinner

were served, to each of which the passengers were summoned in three relays, by means of a dinner-bell rung through the train. The engine burned coal-oil—consequently no smoke, no cinders, but some smell. The train, though a special express, did not move very rapidly—I think from ten or fifteen miles an hour when climbing the mountains to thirty miles an hour when descending. We made stops all along, for no very apparent reason, and never, I think, for less than four or five minutes. The starting was quite a ceremony. First a station-bell rang; in perhaps two minutes it rang again; then the engine blew a whistle; the conductor responded with a pocket whistle; the engine replied, and then we moved off. As soon as the passengers understood this to be the rule of the road, they jumped off at each station, to walk the platform, pick flowers, get snap-shots with their cameras, or get some fruit or a glass of tea or coffee—both are served in glasses, not in cups, in Russia—at the station restaurant.

For the first two hours our route lay over a perfectly level plain, like an American prairie, though with generally a thin soil; on the whole, a poor country. At first the sea lay on one side of us; later the mountains began to appear upon the other side. At about noon we entered the hill country and began to climb up through a ravine, along the edge of a mountain torrent. The valley grew gradually narrower, the hills more precipitous. They were generally barren, always treeless, sometimes cultivated in patches. The roads were too steep and rough for carriages. The carts were a combination of two wheels and two poles; the latter, sticking out behind and taking the place of back wheels, answered also the purpose of brakes down the steep hills; the motive power always small oxen. Steeper and more barren grew the hills, narrower and still narrower the valley, until at last, a little before sunset, we entered a long tunnel on the top of the range we had been climbing all the afternoon. We were, I believe, about three thousand feet above the sea. I am sure we all shared the surprise to find ourselves, when we emerged, in a garden; the fields green with verdure, the trees radiant with blossoms, the villages alive with apparent prosperity. In ten minutes we had passed from a desert into an Eden. Ten or fifteen minutes beyond the tunnel we stopped at a large station, in what appeared to be a town of considerable size, and there remained—five minutes, ten minutes, quarter of an hour, half an hour—and then rumors of an accident began to spread through the train. One of our fellow-passengers, passing through the train while it was in the tunnel, had in the darkness become confused, and either, mistaking the doors, had opened the wrong one and stepped off the train, or had somehow managed to fall between the cars and yet miraculously to one side. Two minutes later the patrol coming through the tunnel found this passenger there, got him on his feet, and succeeded in getting him to a telegraph station at the mouth of the tunnel, telegraphing to our train and getting a hand-car which brought our fellow-passenger on, considerably shaken up and with a broken arm, but apparently not otherwise seriously injured. The tunnel is broad enough for two tracks, but has as yet but one; he fell on the vacant side; had he fallen on the other he would inevitably have been crushed between the train and the wall of rock. We waited nearly or quite two hours for him. Bandages meanwhile were procured and a local surgeon obtained; the arm was set; and we started on our journey. We incidentally learned through this accident that at all Russian stations appliances are kept in readiness for first aid to the injured.

It was thus nearly midnight when our train stopped at the station at Tiflis. Here Cook's arrangements appeared to me to be worthy of all praise. To embark a hundred and fifty passengers from a train, most of them sleepy, none of them knowing the language of the country, nor even each other's language, and get them promptly and comfortably housed in their respective hotels, is no small undertaking, and this was accomplished with much skill. Each passenger had been given a ticket on which was the name of his hotel, and in some cases the number of his room. The passengers allotted to hotel No. 1 were first called in the waiting-room, then those for hotel No. 2, and so on. We were allotted to the last hotel, but got off very quickly, with little confusion or dis-

order, and, handing in our card, were taken to our rooms at once, so that in an incredibly short time we were placed in condition to go to bed and to sleep if we were so inclined. Our hotel was half a mile or more from the center of the city, which deprived us of some of the sights and sounds we might have otherwise had without leaving the hotel; but, *per contra*, we had a quiet hotel, excellent rooms, a good table, and street life that was not without interest. It was essentially German, and but for the fact that we did not speak German and scarcely any one in the hotel understood either French or English, we were very comfortable. Indeed, Tiflis was in two ways disappointing: agreeably, in that I had expected to find primitive and perhaps uncleanly accommodations, whereas I had no fault to find with those furnished to us; disagreeably, in that I had expected to find a city unlike anything I had ever seen before, whereas I saw more of strange sights, faces, costumes, and customs in Constantinople. I should have done well on the first day to have found, if I could, an English-speaking guide and engaged him for ourselves. Whether I could or not, I do not know; they were rare; for English visitors to Tiflis are rare. Some of our fellow-passengers did get English-speaking guides in Tiflis; they were, I believe, Armenians who had lived in England or in America, and who came to the hotels for the purpose of renewing their acquaintance with English-speaking people. I wonder, by the way, how it is that Mr. —— gets his guides and his carriages. He is never flustered or hurried or anxious or even concerned. While his fellow-passengers are running hither and thither, pushing, struggling, bargaining, perspiring, I see him generally looking calmly on, cane in hand, cigar in mouth, placidly amused at the turmoil. When all is over, he has a good carriage, good horses, an intelligent driver, and one of the best guides in the city. It dawns upon me that the guides are as anxious to find a customer as the customers are to find a guide, and he lets the guide find him.

Asia Minor is roughly divided into two districts or sections, in one of which, the northeast, Russia has, through concessions from Turkey, commercial control; in the other of which, the southeast, Germany has, in the same way, commercial control. The monopoly granted to Germany is the price paid by Turkey for aid furnished by Germany to Turkey in the Cretan war, and for her interposition of a quiet but effective obstacle to any European interference with the Armenian massacres. There is no instance in America *yet* of commercialism quite as bad as this. What it may become in the United States if the moral sentiment of the country is not alert, this indicates. As a result of this commercial control, the only languages used in that part of Asia Minor where we were are the Turkish, German, and Russian. English and French are of no use. As none of our party knew more than a few words of German, and we could only guess at the *letters* of the Russian language, we were necessarily dependent on Cook, and as neither of his two representatives had any knowledge of the Russian language, and they had to look after a hundred and fifty passengers divided between three or four different hotels, the situation was one of considerable interest, not to say of some difficulty at times.

Saturday morning we were taken in a series of processions—funeral processions we called them—about the city. Wisely, the company was broken up into small parties—our special one had not over six or eight carriages. One of Cook's agents went with us. From time to time the procession halted and the agent went from carriage to carriage with the information: "The City Hall," "Place ——," "The Opera-House," "The Museum," etc.—information which was not very valuable, nor to me very interesting. The city itself was more so, and of the city we got a fairly good idea. It is divided into two sections by a madly rushing torrent of chocolate water, crossed by at least three bridges, and in one place by a rope ferry. It is surrounded by high hills whose shoulders protrude into the valley and are partially occupied by dwellings. Neither in Tiflis, Trebizond, nor Constantinople has any grading apparently been done. Consequently the streets are often steep climbs or serpentine ascents or sometimes flights of steps, and the garden of one house is on a level with the roof of its next neighbor. Most interesting of all was the life; but that we could have seen almost as well by sitting in our carriage

and letting the life go by us—though we should have needed to move our carriage to different points of view. Here is a funeral procession, the hearse laden with flowers, the coffin borne on the shoulders of the pall-bearers—empty, we are told it is, the body having been quietly buried the day before; here is a company of soldiers, the martial music sounding much like such music on Broadway in New York; here is a Greek church, and we go in to see the Ikon and the veil over the Holy Place; here are wine or water skins of all sizes from that of a small dog to that of a large ox—I have often seen pictures of them, but never the real skins before; here are the Armenian and Persian shops, of which more hereafter; here are Georgian men, their breasts ornamented with a row of silver-tipped cartridge-boxes, and here Georgian women, their heads ornamented with enormous winged head-dresses; here is a fire company going to a fire and carting the water in barrels with which they intend to put it out; here we see men watering the streets with a short hose carried like a garden hose on two wheels, and attached first to one hydrant and then to another; here is a wedding party, whether going to the wedding or returning we do not know, the bride sitting in an open cab, dressed all in white with a gorgeous bouquet in her lap, and with, I suppose, the groom at her side; and everywhere we are tormented by signs printed in letters sometimes like and sometimes unlike the English, with now and then a resemblance to the Greek, to which we in vain endeavor to attach some meaning.

But our most interesting experience in Tiflis was that of Saturday afternoon at the Armenian and Persian shops. These line both sides of several narrow and crooked streets in the old town, and here both manufacturing and trading are carried on, as I suppose they have been for many centuries. These shops, like the smaller bazaars in Constantinople, are little rooms ten feet broad by perhaps fifteen deep, their only light and ventilation being from the front, which is entirely open to the street. The customer stands in the street in making his purchase; the dealer, in what has all the aspects of a cave. Some of the more sumptuous shops are large enough to allow half a dozen customers or so inside the cave, but these are few. The weaving and silver work are done in the interior of the cave; all the goods are contained in one rather small show-case on the quasi-counter which serves as the partition between the cave and the street. There are absolutely no prices. These people are children, and bargain as boys do at school. "What will you take for your top?" "Ten marbles and two agates." "What do you take me for? I will give you five marbles." And so it goes on until an exchange is made for six marbles and one agate. I do not believe that these "merchants" have any idea what their raw materials cost, or what their labor is worth, or what profit they must get to make a living. All they know is that they have something which they do not want and which they wish to exchange for something they do want. A hundred and fifty customers, of all grades of worldly wisdom and worldly inexperience, some with plenty of money, some with little, some by nature spendthrifts, some by nature calculating every penny of expenditure, some hating bargaining, some thinking this chaffering is a great lark, none of them knowing the language of the town, only two or three interpreters in the entire crowd, all bargains substantially made by signs or by writing the figures offered and demanded on a scrap of paper; the entire principal street, barely wide enough for one carriage, crowded with interested traffickers and equally interested spectators, native and foreign—such was the scene that Saturday afternoon. Our railroad ride from Tiflis back to Batoum gave us fine views of the wild and romantic scenery which in coming up we had passed through after dark. The day was exceptionally clear; one view, especially, I am not likely ever to forget. The clouds covered the top of what seemed like mountains, ten miles from the base of which our train was running. Above these clouds a snow-capped peak towered, seeming as if it were hanging in the air above our heads by some marvelous suspension of the law of gravitation. I wanted to believe that this was Ararat, which was situated in that direction; but, after some discussion with a fellow-passenger over a map on which the mountains were indicated, I had to abandon that idea as untenable.

L. A.

A FIGHT FOR THE CITY

THE STORY OF A CAMPAIGN OF AMATEURS

BY ALFRED HODDER

Private Secretary to District Attorney Jerome

III.—The Alliance Between Puritan and Grafter

FOR all practical purposes the puritan idealist and the "practical politician" are confederates in a game to defraud the public. The puritan plays for the credit of striving on all occasions, in public, in season and out of season, for the recognition of his code; the practical politician plays frankly for money. The two play into each other's hands, with never a wink to betray them, and the public pays. The puritan is rarely so unskilled in the ways of men as to believe for an instant that the laws he insists on having passed will be or can be enforced. He says brutally and simply, "I cannot and will not, in public, compromise with vice." He is not usually, in other matters, destitute of common patience or of common sense; and it is not to be presumed that he is so in this isolated instance. By his uniform protestation of hostility to vice, he gains or preserves the reputation of being a man of principle, and risks nothing. He maintains his peace with the women of his household, and, if he be a clergyman of doubtful dignity and ascendency, with his congregation (clergymen of indubitable dignity and ascendency have been among the steadiest of Mr. Jerome's supporters). He sacrifices the public interest to his personal welfare; excusing himself sometimes, no doubt, on the ground that the effect upon his personal welfare is obvious and immediate, while the effect upon the public welfare is incalculable and remote; but oftenest on the ground that the public interest is best served by the administrative lie. The lies of the Jesuit are by his enemies declared to be elusive, swift, subtle, shifting, manifold; the lies of the puritan are instead emphatic, monotonous, colossal, few. They are for the most part lies concerning the community or human nature as a whole: good, round, mouth-filling, chest-expanding falsities as to what for humankind or the community is possible or true. The corrupt politician welcomes the puritan as an ally. He sees in laws that cannot and will not be permanently enforced a yearly revenue in money and in power. He sees that, if there were not a great many puritans in fact and in profession, venality in political life would cease to pay. The occasions would be too few on which a corrupt politician had anything of worth to sell. The maintenance of a corrupt organization costs money, day by day; and, without the wealth of the liquor interest and the prostitution interest and the gambling interest to draw upon, individuals indeed from time to time might pocket considerable sums of money for the sale of franchises and similar commodities, but such an organization as Tammany would lack the bare necessities of life. The refusal of the puritan "to compromise with vice" is Tammany's opportunity; and Tammany has never been slow to make the most of it. The puritan arouses public sentiment; Tammany, holding office, sees to it that the law demanded by that public sentiment is inserted upon the statute-book, and looks to the inevitable violation to supply the mainspring of its power. "Who were the advocates of the amendment of the gambling law in the Constitutional Convention?" Mr. Jerome asked, pertinently. "The foremost among them was Delancey Nicoll, the representative of Tammany Hall. And who reaped the benefit of it? Johnny Carroll, Frank Farrell, Johnny Sexton, and the gentleman who works his

private gold-mine from his home in Wantage, England."

It sounds like a paradox to say that the average saloon-keeper would prefer to close on Sunday, but the fact is undeniable. Since he cannot close for the whole day, he would prefer to close on Sunday morning under a law rigidly enforced. The Liquor-Dealers' Association were loyal supporters of Mr. Jerome. After all, the saloon-keeper is a man like another, and is not anxious to work more than six days in a week, unless he finds work on the seventh day indispensable to keeping step at the pace set by competition. The saloon-keeper dares not close on Sunday, because his neighbors dare not and do not close. Which of two saloons on opposite corners at a street-crossing a man shall enter first is commonly a matter of pure accident; he happens at the time to be on one side of the street and not on the other; he enters the saloon that is the nearer. A prompt or a courteous or a facetious bartender takes his fancy, and for years together he and his friends, when they want a drink in that neighborhood, walk a block to go to that saloon. They pass other saloons on the way, as they might so many clubs of which they are not members; they never dream of entering the saloon on the opposite corner. But let their favorite saloon close on Sunday, and when they have tried the side door and found it locked, they stray across the street, and there, too, they find a prompt or a courteous or a facetious bartender; they become domesticated; they have been made free of another club, to which thenceforth they go on week-days as well as Sundays. A saloon-keeper whose neighbors keep open on Sundays must himself keep open on Sunday or lose in great part his week-day trade. He, like his neighbors, must pay blackmail for the privilege; and in the majority of cases the blackmail more than covers his profits, and he closes the day at a loss. Sunday opening is demanded by the public; but violation of the Sunday-closing law is not on that account a source of profit to the saloon-keeper; it is a source of profit only to the grafter. The very keepers of gambling-houses would prefer to ply their trade under restrictions rigorously enforced. "If anybody ought to understand the working among gamblers of our present system of corruption," said Mr. Jerome, "it ought to be 'The.' Allen. I have had the pleasure of a number of conversations with 'The.' 'The.' tells me gambling is by no means what it used to be. He tells me that in the old days, on a police captain's birthday, the gamblers would all get together and buy him a gold shield or a repeater, or give his wife a silver service, and then the thing was at an end. But by and by the captain had two or three birthdays in a year. A little before the Lexow days the practice of the monthly payment came into fashion; and then one of the shining ornaments of the Department down in the old Eleventh Precinct inaugurated the system of the initiation fee. That worked nicely; and then another formed the bold conception of $500 a year for a gambling-house and $50 a month. And then they found that $50 a month was not enough, and demanded an occasional extra. Then it was one extra and another extra—and since you have done me the honor to place me in nomination there has been another extra.

"At present the police force and the politicians are no longer content with levying blackmail upon gamblers. They insist upon appointing all the employees of the establishment, except the doorkeeper, who is a confidential employee and not subject to civil service rules; and, further, they insist on nominating a partner in the business, who takes from twenty to thirty-five per cent. Vice is growing almost unprofitable in this community; it is in need of a protective tariff."

The alliance between the puritan and the dishonest politician scarcely could be set forth in stronger terms.

The belief of the puritan that the administrative lie redounds to the advantage of the public is best to be defended on the ground of the hypnotic force of the administrative lie. The traditions that an Englishman never knows when he is beaten, and that one Englishman is equal to four Frenchmen, have no doubt won games played with cannon and sword and musket, as clearly as the tradition that no eleven from Yale is beaten before the last second of the time-limit has won games played with a pigskin ball. People of English blood have a robust talent for administration, and a

sturdy faith in the administrative lie. They believe in the power of good words; they have an innate gift for words, and are subject to their charm. They are a fighting race and a commercial race, yet they cannot go to battle on an openly avowed ground of public or commercial expediency; they must first have for battle-cry a decorative and thrilling phrase, not meant to bear the light of sober scrutiny. "All men are created equal;" "A house divided against itself cannot stand;" such decorative and thrilling phrases lift their lives in their own minds into the realm of the ideal, dignify the conflict, let their deepest passions loose in the service of their will. In the long warfare to be waged by each and all against the devil and his works, it well may seem expedient to invoke the aid of all such decorative and thrilling phrases as may serve to form and fortify the will. It well may seem a tenable hypothesis that, by sheer reiteration of audacious but inspiring falsities concerning what men are or may be, they may be transmuted into some sort of likeness to the nature asserted to be theirs. But the hypothesis has, in the case in question, been tested by experience; for generation after generation there have been maintained upon the statute-book the formulas of the hypnotic lie. And some twenty thousand gamblers, young and old, according to the report made by Mr. Nixon, nightly crowd the gambling-houses of the city, and the saloons stand open Sunday, with at most closed shutters and a change of entrance, and prostitutes by scores of thousands ply their trade where he may know who will.

It is characteristic of Mr. Jerome that his most explicit speeches on the subject of prostitution were addressed to the richer classes of women; to the auditors, that is to say, whose enmity it was believed he was most certain to incur. It is in the woman's world that the administrative lie bears most exclusive sway. The average Anglo-Saxon man, as has been said, is at once idealist and realist; an idealist in aspirations and in words, a realist in practice and in sense for fact. By his sense for fact, by his increasing acquaintance with fact, he is debarred from a living faith in his own words; his is a soul at variance with itself. Among wage-workers the woman's world and the man's world are, on the whole, the same; it is among the well-to-do that there exists a separate woman's world. What constitutes the main distinction of this separate world is its entire severance from fact; contact with fact and even veridical report of fact have been excluded with a prodigality of pains. The Anglo-Saxon woman of the richer classes walks abroad with greater freedom than her sister of the Latin race, because, by tacit compact of the men about her and her own consent, move where she will, she moves within the walls of an invisible harem. She has been revered by men precisely for the sake of her ignorance of fact, and has herself till very lately found a ground for pride in the confession of her ignorance.

Mr. Jerome unhesitatingly invoked her aid against the grafter and the puritan; and in so doing advanced into the very citadel of the administrative lie. It is with regard to the relations of the sexes that she has been kept in strictest ignorance and is believed most passionately to resist and to resent enlightenment; and it is with regard to them that she exerts upon men's public speech most influence, deliberately and unawares. On that topic men's administrative lies are framed rather for her ears than for their own. That on that topic there ought really to prevail a perfect ignorance in the woman's world and the child's world is a contention that no doubt may be maintained with a certain plausibility, while the child's world and the woman's world remain apart from the man's world. The case is altered when the woman's ignorance of fact becomes a force in the world of men and of affairs; that the conduct of the State should be determined, not by ignorance of fact, but by consummate knowledge, is in the long run of supreme importance also for the woman and the child. Already on the third night of his campaign he had admonished the women of the richer classes of the harm their ignorance of fact might do in politics if they attempted to take an active part, and of the need, if they desired to be of service, that they first should be at pains to know and understand. The next evening, when he found himself addressing at St. Nicholas Rink an audience of men and

women of the richer classes, he took for his main theme the laws that deal with prostitution. And here again he asked the women in his audience to be at pains to understand. With his accustomed precision and energy, he defined the moral issue in the case in question as concerned, like other moral issues, solely with such matters as lie in our own power; not with the morality or immorality of modes of life that no vote of ours can alter, but with the morality or immorality of laws which our votes have passed and may repeal. "I am going to speak of the question of sexual morality here to-night," he said, "though there are ladies present, because I never knew a good woman yet that you could not talk straight goods to, and because no good woman should be ignorant of the state of this question in the city of New York. It is a false and prudish modesty that seeks to veil in silence the conditions that exist in this great city, instead of disclosing them and seeking for a remedy.

"My own notions of morality are in their way as strict and as severe as any Puritan's; they are as strict as yours can be. But it is a question now of the conditions upon which our notions of morality are to be brought to bear. There are in the city of New York to-day, in the greater city of New York, in all likelihood almost a hundred thousand women who make their living by prostitution." (This figure was challenged afterwards. "I do not know the exact number," said Mr. Jerome in answer, from another platform. "No man knows it. It may be eighty thousand, it may be sixty thousand. God help us! it is too many if it were but one.") "The history of mankind shows us that for thousands of years such conditions have existed; human judgment tells us that they will continue to exist long after we and our grandchildren have passed away. The righteous man is not the man who seeks by the severity of the criminal law to seem to be preventing that which the law is powerless to prevent. The righteous man is he who seeks to minimize the evil the law cannot prevent. The righteous man is he who scans closely and weighs long the consequences of his laws. The existing law in the city of New York is of as little effect to prevent or to restrain as if it were chalked up on a billboard in Chicago; but it is of infinite effect for harm. Do you think it makes for the decency and honesty of the police force, do you think it makes for such decency and honesty as may be maintained even among fallen women, that there should be a sort of league established between fallen women and police officials, and that police officials should grow rich upon wages of their shame? I am far enough from meaning to speak ill of our entire police force, whom by our laws we have done all we could to turn into perjurers, panders, and blackmailers. Not all, not many, of the men that walk the beats touch a penny of that money; few if any of the roundsmen touch a penny of that money; few of the sergeants touch that money. Many of the captains, very many of them, take that money. When you find a captain of police retiring on a competency, you may divine the nature of his gains. When I was a practicing lawyer, I was able to earn more than a captain of police; since I have been in public office my salary has been greater than that of a captain of police; but my most sanguine dream of financial success is to retire in my old age with a competency such as many a captain of police retires with. If am extraordinarily successful in my profession, I too may be able to invest in lots in Japan.

"Do you think it is endurable that through the connivance resulting from the league established between police officials and the keepers of houses of prostitution, young girls should again and again be taken from their homes and kept in those houses against their wills? that those houses should be the only houses in the city from which cries for help are by policemen never heard? I mean literally that screams issuing from the upper windows of such a house, and heard by men in the street, are by policemen in the street not heard or not investigated. They do not dare hear; they do not dare investigate; the keeper of the house pays protection. You hear talk about the evils of prostitution, you hear talk about the horrors of white slavery in the houses of white prostitution, and it is to you like hearing evil fairy tales or tales of wrong done in far-off lands. It is not a fairy tale, it is not a tale about some foreign city; case after case comes under my own

observation—case after case of just that kind. If any single one among these cases happened to be brought to your personal attention, you would be horror-stricken; but you feel no responsibility. You feel yourself under no obligation to declare that these things shall not be so. You say of the man who tells you of them, that he is a railer, and is talking about he knows not what. And I, who know about these things, not simply from direct personal observation in the district in which they happen, but because I have time and time again sent good and loyal men into these houses, and taken these girls out of them and restored them to their families, am called a Carrie Nation for my pains.

"And therefore I care little enough what you think of me or what you call me. I was at a meeting at Progress Hall, on the East Side, last night. I would give more for the good opinion of those people, for the good will of those people, than for all the solemn pledges of support that could be given by the women—and the men—that live above Fourteenth Street on the West Side. To them the situation is no abstract problem; to them it is no new and curious story about a far-off land. To them and me the situation is a great reality which we are face to face with morning, noon, and night.

"Have you ever known, have you ever taken pains to know, how, under our existing law and administration of the law, vice overflows our tenements? The man who earns his living as a motorman on a cable-car, the man who goes to one of the sweat-shops to sew garments, and too often has to take his wife with him in order to earn the little pittance necessary to support his family—he and his wife know. That man has to leave his daughter at home, that man has to leave his children at home; economic conditions require it, they necessitate it; and when he goes, in the next apartment to him, or on the floor above, or on the floor beneath, the harlot is plying her trade.

"It is not so easy a matter to oust the harlot as some of you imagine. She cannot be killed, she cannot be electrocuted, she must perforce be somewhere; but in the tenement-house she need not be. And the law could be made different and its administration could be made different, and the lot of the wives and children that poor men daily leave behind them could be made different, if we had an honest, rational, and decent administration of our city government; and we have not had it; and the responsibility rests mainly with you, who have had leisure and intelligence and education, and have neither known nor cared."

"The first thing every man and every woman must do to deal effectively with such a subject as the social evil," he said four nights later, in his second speech before the Women's Municipal Club, "is to forget all theories and dreams and hearsay, and set his heart to know the truth. We have before us, not a theory nor a dream, nor yet a story told by a romancer or a traveler, but the hard, bald fact that there are at this moment prostitutes by scores of thousands within the limits of the city of New York. There is in this fact nothing new—new even to you; we all of us from time to time have read in the newspapers about this state of things. In the world this state of things is very old. It is something that existed a thousand years ago; something that existed a thousand years before that; something that will in all human likelihood exist, despite the efforts of good people to the contrary, a thousand years from now.

"If you want to aid us, if you women want to put forth all your great influence in dealing with this evil, and to make your influence all-powerful, acquaint yourselves with the history of the evil; read, for instance, Sanger's 'History of Prostitution.' Read there the meaning of this state of things which is as widespread at the beginning of the twentieth century of the Christian era as it was before the coming of the Light. Then, when you have read, make up your mind that even though you wish to save the souls of the scores of thousands of unfortunates in this city, you cannot save them—because they do not want to be saved.

"There are conditions which it is impossible to counteract. One of them is to be found in the social circumstances of the women who, speaking generally, make up that class. It is made up, not out of members of the richer classes, though unfortunately those who have had the opportunity to lead prosperous lives within the strictest bounds of virtue come in to

swell the list. It is made up for the most part of poor girls taken from the walks of life where life means drudgery, where there is little cheer to refresh and invigorate the tired hearts of the overworked, and where amusements come seldom, if they come at all.

"What we need in this great community are opportunities for cheap and innocent amusement, and we need them more than we do libraries! What we need next to amusements to bring about a bettering of the existing state of things are wiser laws. And we need wiser laws, not imposed from the outside by legislation at Albany, but proceeding from the wisdom and the conscience of our citizens, and in especial from the wisdom and the conscience of the citizens who constitute perhaps the soundest and the strongest part of our American Republic—the American women with minds and eyes to study and to see, and, when they have seen and studied, to advise.

"Believe me, when I say wiser laws, I do not mean a system of segregation, I do not mean a system of licensing. I honestly believe that never in the world will an English-speaking race consent to the legalizing and organizing of a traffic in women's sin and shame. But among the arguments that weigh most heavily with English-speaking nations against what is called State regulation, is the slavery imposed upon these women—imposed by men who are in great part partakers in their shame. As rigorous a slavery exists under our laws to-day. Mr. Philbin has told you of the unspeakable cadet system. The cadet system is possible only because the women in the houses of prostitution are the slaves of the women and the men who keep those houses; their slavery is possible only because of the alliance that our laws promote between the keepers of the houses of prostitution and the police. Are you concerned to know how far this slavery has gone and goes? The other day a man who wished to open a place of this kind was told: 'All you have to do is to open up, and after that see to it that the girls never have any money.' Never have any money! Without money they cannot leave the house, they cannot even have clothes to leave the house; it has come to this, that the one secret of success in this abominable traffic is to cheat these women of the earnings of their shame!

"If we are to have laws more tolerable to our moral sense than any of the systems of State regulation, bear in mind that the legislation must be wise. At present you who would aid in bettering the condition of affairs know nothing of the tremendous subject you have chosen for the field of your good work. It will not help you to quote Scripture. It will not help you to consult your clergyman. You yourselves can learn all that you need to know by reading works dedicated to the subject that deal with it scientifically and coldly. There is not a man can rise on the floor of the Legislature to advocate laws dealing with this problem in sane and sober fashion, without knowing that he will meet political death as he finishes his speech. There is not a man in the Legislature who dares brave the public censure sure to be evoked by such a stand. And yet to deal with the problem in a sober, scientific way is the one chance of success.

"And who is to talk in that way? You wives and mothers and sisters and daughters! You, after coming to close quarters with the subject to save those whom you are trying now to save at an ineffective long range. Study the evil historically, and you will find that even though we cannot hope to exterminate it, we may still, by wise or unwise measures, increase or minimize its harm. Hope and plan still, if you will, to exterminate it in the future, when in the present you have minimized its harm. But in the present it is you women who must do the work. I have talked with many clergymen upon the subject, and many of them have said to me, 'While we agree with you perfectly, you will agree that for us it is too hot stuff.'

"You will find that it needs courage to come to the front and speak your meaning plainly on a subject which custom has so long forbidden to your lips. But you need not come to the front. Work in quiet. Guide your men. Aid your men by showing that you have taken thought and understand. At heart they understand. But they are cowards in this matter. They dare not speak or legislate according to their knowledge, for fear of public

opinion, which is in great part your opinion; very many of them dare not because they know that their own lives have not been beyond reproach. It is for you to be the first to speak, whose lives are known to have been pure; it is for you, when you have come to realize that although the law which in this matter is to govern each man's conduct is to be found in Scripture, the law which is to govern lawmaking is to be found there in so far only as it is included in the laws of beneficence and truth."

With the women he was addressing the main danger to him lay in the reproach of laxity, of over-readiness to believe that sheer determination on the part of the virtuous members of the community could not there and then end the whole vast evil; though indeed women everywhere, to the bewilderment of his advisers, justified by their response the hardihood of his appeal to them, and were among his most enthusiastic auditors. "We have considered," wrote the President of the Women's Municipal League the day after the speech just quoted, "what you said about the evil of prostitution and the need of women's taking the problem up to solve it, and we trust that after election you will draw a bill and statute embodying the ideas that you expressed to us, and give, not the men, but the women of New York a chance to have it passed." To women he had found himself compelled, by way of prelude to his own plain scheme of legislation, to insist on the impracticability of projects of sweeping and absolute reform. "Look steadily," he said, "at the vast multitude of prostitutes. What shall we do with them? Reform them? You cannot. They do not want to be reformed. Unless you exterminate them, to stop their traffic is as impossible as to stop the rising and setting of the sun. The conditions that impel them to the choice of their profession are what they are. The impulses in men and women that everywhere in the world have made for the maintenance of that profession are what they are, and will remain unchanged until the human race is physically so degenerate that men and women cannot stand upon their feet. They are a perfectly natural phenomenon. They are intimately connected with the sources of our bodily and mental strength. The one thing that now serves anywhere to keep them within the bounds prescribed by Christianity or decency is the effort of will-power on the part of strong men and women whose moral sense is unimpaired.

"But, they tell us, why not come to the aid of the will-power and the moral sense by force? Why not enact prohibitory laws? We have the laws. Is it not these very laws, these anti-prostitution, anti-gambling, anti-liquor laws, that have corrupted our police force and have added to the evils that ostensibly they counteracted the further evils of perjury and blackmail and arbitrary power? The men in our police force, men by nature exceptionally brave, intelligent, deserving, men who have the welfare of vast masses of our population committed to their charge, by these laws are placed in circumstances that seem as if deliberately plotted for their downfall. Why, then, ask for more laws of this kind? Make these laws more drastic? If we have a cylinder filled with water, which is a non-compressible body, and we try to compress it, the moment we bring force enough to bear, the vessel bursts. The only successful way of diminishing the body of water in the vessel is to open a valve in it, and then the water is not diminished, it escapes. Just so with these women. They are an incompressible body. The laws by which we try to exercise a compressing force upon them for the most part are powerless; they escape. They escape into the crowded tenement-houses. They escape where they can do most harm.

"But give them a chance to escape where they can do least harm. Govern them by one only of the laws by which at present we seek to govern them. There are two laws at present in the Penal Code with reference to this subject—one which makes it a crime for any person to maintain a house for people to resort to for purposes of unlawful sexual intercourse, one which provides that any act by which public decency is outraged shall be regarded as a public nuisance. Govern them henceforth only by the law of nuisances; rescind the other law. If there is a house that by sight or sound gives

token that such traffic is carried on within, make the proprietor amenable to the law of nuisance. If such traffic is practiced in a tenement-house, make those who practice it amenable to the law of nuisances; let it be practiced, since it must be practiced, out of sight of the innocent and young. The law of nuisances can be enforced. Let there be no other interference by the criminal law; let there be not even so much as public recognition. And in taking from the statute-book the law which cannot be enforced, which is not meant to be enforced, you will at the same time be dissolving the alliance between the prostitute and the police."

On men he urged the same arguments, but with a difference of accent. Among men there was small reason to lay stress on the impossibility of a more radical reform. It is characteristic of the dual working of the administrative lie that whereas among women the charge he had most ground to dread was that of laxity, among men the charge that he had oftenest to meet was that of overstrictness—of fanatical and intermeddling puritanic zeal. His raids had been repeatedly and publicly construed as a crusade against personal liberty—the personal liberty of the keeper of the saloon and of the gambling-house, the personal liberty of the "madam" of the house of prostitution, the personal liberty of their patrons in the community at large. It is significant of the temper of the public with regard to the enforcement of the sweeping prohibitions on the statute-book that one of the main topics of his adversaries was a sentence of three months' imprisonment imposed by him upon a female barkeeper found selling liquor Sunday, though in this instance the offense was known to have been aggravated by perjury and by the instigation of perjury in a child; and that another topic of invective was the penalty imposed upon the "madam" of one of the raided houses of ill fame. "You have probably heard that I am making a crusade against personal liberty," he said on more than one occasion. "Tammany and I do not mean the same thing by personal liberty. I do not think that there is personal liberty under a régime of blackmail. I do not think that there is personal liberty in houses of ill fame.

"I want it understood that I do not expect New York to become a Garden of Eden; possibly a good many of us would not think that a very merry place to live in. But there are matters in which every decent man is in duty bound to interfere. I know what human nature is as well as you; I was not born yesterday. I know that the social evil is as old as the world itself; I know that I cannot change, I know you cannot change, the ways of the world. But I want to see an end of blackmail in this city; I want to see an end of perjury in this city; and I want to see a reasonable degree of decency observed. I want to know that the people who live in tenement-houses may feel that the daughters whom they leave behind them when they go to their day's work are not exposed to peril from a prostitute who plies her trade on the same floor. I want to know that their daughters are not made prisoners in houses of ill fame by force or fraud."

"I have little enough interest in those gilded youths," he said in one of his earlier Brooklyn speeches, "who are pulled in by the bedizened women of the street in the vicinity of Tammany Hall. That doesn't concern anybody very much. The bedizened woman is not of very much account in that part of the town, and the gilded youth is of no account whatever. But what is of vital import to the Bronx and Manhattan is that the poor man's home should be kept clean, that the poor man should have a chance to bring up his daughters out of sight of the traffic of the prostitute, that the poor man's daughters should not be entrapped and held in houses of ill fame by force or fraud. It may seem almost incredible, the system of supply for houses of ill fame that under the protection of the police has grown up on the East Side, but it exists, and it is widely spread. Men put women into houses of prostitution; if necessary, they marry the women and then put them there. These men are the so-called cadets. They are no nightmare, no mere monsters of the imagination; they are a horrible reality. They live there on the spot, and there are very many of them. Occasionally one is caught and convicted. Everybody in that district knows them well.

"The women in those houses of pros-

titution are not paid. The keeper of the house receives the wages of the woman's shame, and gives her a brass check—like that." (Mr. Jerome drew from his pocket a brass check.) "This check is one of those taken from a house we raided in New York, and it is in checks like these that the girls on the East Side receive the wages of their sin. Once or twice a week, in theory at least, they cash their checks; a check like this represents twenty-five cents.

"But if the girl is put into that house by a man, often and even usually it is not she herself that takes and gets the cash for even these checks: the man who put her in there takes the checks and has them cashed and keeps the money. In a week, in a month, in a year, the amount of money is considerable. [Mr. Jerome stated here that sworn testimony shows that on an average in the most brutal houses of ill fame a girl receives eighteen brass checks, like those he exhibited, each night. These facts, horrible as they are, were amply substantiated by Mr. Jerome.] The girl in there has no means by which she can escape. Her clothes have been taken from her: she has perhaps a wrapper, a pair of stockings, and slippers. Many of them come from foreign lands where arrest for debt is customary. They are told that they are indebted to the woman of the house in this amount or that amount, and that they cannot leave her without paying. I have in my possession account-books of these places, showing how these women are charged for the ordinary necessities of life and are kept there in that condition. There is not simply one of these houses on the East Side; there are several hundred houses in which substantially the same method is pursued.

"In collaboration with the Committee of Fifteen, only about a week ago, we tried by way of experiment to buy the good will of a house of prostitution from a wholesale dealer in such houses; and he said to our agents, 'Yes, I will sell you a house of prostitution,' as though he had been speaking of the sale of so many yards of cotton goods. 'What is the price?' 'Well, this is a fine house; it has thirty-four beds; I will sell it to you for ten thousand dollars.' 'All right,' said our agents, 'we will take it.' And he proposed a little celebration at the Dry Dock Hotel in honor of the transaction; and our agents went there with him, and he received from them a little money, and accepted promissory notes for the remainder. And while they were all sitting round a table at their little celebration, in walked a policeman, accompanied by two or three agents of the Committee of Fifteen, with my warrant for the man's arrest. He had been taken in the act of selling the house. And the man was Jake Hertz, a prominent leader on the East Side, one of the right-hand men of Martin Engel. Before our agents consented to buy the house they took the pains to ask about its running, and were told, 'There is only one thing that you need see to. Run your house so that the girls never have a cent of money, and they can never get away.' Is there personal liberty when in a civilized community we have women kept in that condition? Is that your conception of democratic liberty? Is it violating personal liberty to try to stop it? Is it enforcement of the blue laws, is it Puritanism, to try to put a stop to a state of things like that?

"That is the sort of civilization that has sprung into existence and that flourishes under the rule of Tammany Hall. It exists and flourishes, no doubt, without your knowledge, but there are many men who know. I was talking only yesterday with Mr. Barondess, a Socialist leader among the Jews on the East Side. Probably no formal proposition could be framed concerning politics on which he and I would not differ, but we talked three hours together, and I never spent three hours to greater profit, because I felt myself in contact with a real man and a man who told the truth. More even than has come to my knowledge as a Magistrate he knows, and those around him know. If I could tell you from this platform all he told me, if I could tell any audience from any platform all he told me or even all I know without his telling, the end of the long rule of Tammany Hall would be beyond all question near at hand. I think it is already near at hand. I think these things have endured so long and are so widely known and have come close to the hearts of so many men already,

that our victory is certain; I think that we shall carry both the county and the city ticket; but it is far too grave a moment to take chances: it may be we cannot win without your help. Remember against what it is we fight; remember for what it is we fight. We do not hope to make New York a Garden of Eden, but we hope to keep the poor man's home reasonably clean and sweet and safe. We do not hope to drive all prostitutes from the city, but we hope to exclude them from the tenement-houses, and to drive into the deep sea all the wretches, cadets or police officers or politicians, who live on women's shame."

The German Immigrant in America

By Edward A. Steiner

TO the Reformation was due in a large measure the formation of America, and the stamp of Protestantism which this country still bears was put upon it by the early colonists whose consciences came in conflict with the Church and with the throne, men who needed a newer and a larger world for the development of their ideals. Upon the path made by English Quakers came in 1682 the first German settlers; they were Mennonites, a Protestant sect which combined in its tenets many of the faults and virtues of both Quakers and Puritans. They sailed up the peaceful and shallow Delaware Bay, settling in what is now called Germantown, and soon their little cottages were surrounded by gardens where the rosemary wafted its fragrance on the air, and where no doubt the cabbage lifted its astonished head above the ground, little dreaming that some day it would be "monarch of all it surveyed." In some points these Germans out-Puritaned the Puritans, for while it is said that the Puritans did not kiss their wives on the Sabbath, these German Puritans did not kiss their wives at all. That they brought with them noble ideals is proved by the fact that they were the first people on this continent to oppose slavery, and sent to the Quakers a petition to that effect which contains the following quaint paragraph: "If once these slaves (wch they say are so wicked and stubborn men) should joint themselves, fight for their freedom and handel their masters & mastrisses, as they did handel them before; will these masters & mastrisses tacke the sword at hand & warr against these poor slaves, licke we are able to believe, some will not refuse to doe? Or have these negers not as much right to fight for their freedom, as you have to keep them slaves?"

The Germans were also the first among us to legislate against the vice of intemperance, and may be said to be the first Prohibitionists, a fame which the modern German immigrant does not care to share with them. One of the most ideal men of this time was Francis Daniel Pastorius, a man who combined in himself all the graces and virtues of his noble race; he was a lover of science and the finer pleasures, and was a mystic who yearned for the closer communion with God. Pietists, Tunkers, and others followed the Mennonites in the eighteenth century, and Pennsylvania was soon dotted by communities in which these strangely garbed people lived their peculiar and simple lives. To name them all would require much space, and to describe their peculiarities would fill a book. The Schwenkfelders, the Moravians, and the Amish were the most important among the later arrivals, and Germany seemed to have exhausted her ability to produce sects after their departure. Encouraged by good Queen Anne, Lutherans and Roman Catholics came later, and these were neither as pious nor as intelligent as their predecessors, but were the advance guard of that vast horde of peasantry which ceased not its coming for nearly two centuries, which moved from Pennsylvania to Ohio, from there southward along the Mississippi to Louisiana, and northward to Wisconsin and Minnesota, and which was a great factor in redeeming the wilderness and making it to "blossom as the rose."

Thousands of these peasants were sold

into a semi-slavery as Redemptionists, and thousands more laid down their lives in the attempt to blaze paths through the forest and make the fever-stricken plains habitable. Wherever they went they created wealth by their unremitting industry, by their skill in cattle-raising and farming, so that where an English-speaking farmer starved and was forced to move westward, they stayed and dug riches out of the neglected soil. To-day, in traveling through this country, one can almost invariably detect the German farm, and the German farmer is everywhere the standard of excellence.

None of these immigrants were idealists like their forefathers, but were content to worship God as did their fathers, and by the honest sweat of their brows eat the fruit from their own "vine and fig tree." In 1848, when the breath of freedom grew into a wind-storm, there came involuntary immigrants, political exiles of whom Carl Schurz is the best known, if not the best example. They were all educated men, many of them real scholars, and whatever culture there is among the Germans to-day in our cities is in a large measure due to their influence and example. They and their descendants are our real German aristocracy, and in the German centers of Cincinnati and Milwaukee they form the select society.

While these men were idealists politically, they were in a large degree materialists religiously, and planted the seed of Marxian Socialism and of infidelity among their countrymen. One whole colony in Minnesota made it one of its tenets not to have a church or even to mention the name of God, and the little city of New Ulm bore that distinction for a great many years; but in spite of the most diligent efforts to keep God and the churches out of their town, several houses of worship have been built in late years, and while much skepticism still prevails, the younger generation almost as a whole has turned to its God.

The modern German immigrant comes pressed neither by hunger nor by his conscience, but most often to escape irksome military service, or drawn by the German "Wunderlust" which carries him beyond the mountains of his Fatherland into all corners of the earth. On board ship he is the jolliest of passengers, and you will find him at the bar in the morning for his beer and late at night in the smoking-room with a crowd of jovial men and women, singing the songs of the Fatherland, which grow sadder as he grows jollier. He carries with him an exalted opinion of his own country, and has fully made up his mind not to let anything crowd out his love for it, so that when New York Harbor with its vastness and beauty rises before him he insists that it is not half as big or as beautiful as the harbor at Hamburg, and only at the sight of the sky-scrapers does he acknowledge our superiority. I once stood before mighty Niagara with one of these subjects of Kaiser Wilhelm, and, with a deprecating shrug of his shoulders, he said, "Ve gots dem in Shermany too." This attitude towards our country lasts a long time, and is lost only when success comes.

The German immigrant invariably has a good common-school education, although not always possessed of culture, and, if he has it, he does not find much of it among those with whom his lot is cast. A young chemist whom I met grew so despondent at the sight of his German boarding-house and at the lack of manners among the boarders that he returned to Germany two weeks after he landed. Not many such young men come, and few of such who come succeed, for the hustle and bustle, the common tasks to be performed, and the common people whom they must meet as equals, repel them; the weaning from aristocratic notions, the being thrown into the hopper without being asked, "Who are you, and who are your parents?" are painful processes, and only the fit survive. Although the process is slow, it is sure. A young man who has come to this country to study our way of doing business is employed in a large department store in Chicago as a bundle-boy. At first he politely addressed the elevator man thus, "Vill you blease let me off on de second floor?" but within two months he said imperatively, "Second," and he was on the road toward complete Americanization.

The city of Milwaukee is probably the most German city in the United States, although nothing in its business or residence portion suggests the Germany across the sea, and, with sixty per cent. of its population German, it has not impressed upon the city the best things which we

usually associate with that nationality. The intellectual life of its people does not receive that stumulus which one might expect, and whatever German culture there is outside of the ever-diminishing circle of the "forty-eighters" has been transplanted by Americans who have traveled and studied in the Fatherland. The few Germans who try to bring the Germany of Am rica in touch with its glorious heritage across the sea give it up after trying, only to fail most miserably. The cry I most often heard from them was, "The idealists are dead, and the dollar reigns supreme." With a few exceptions, neither the German stage nor the German newspaper has been able to keep alive that intellectual spirit, and, as a rule, the German population falls below the American in its desire to keep in touch with the intellectual life of Germany. "We have two kinds of Germans in Milwaukee: soul Germans and stomach Germans, and the latter are in the vast majority," said a keen observer; and it does seem that the national spirit rallies around social usages rather than around the things which make Germany a world power in the noblest sense. The editors upon whom I called were all intent upon telling me how great their papers were and how many subscribers they had, and I could not go beyond the business point with any of them, although I wasted two hours upon one of them trying to get a glimpse of his German soul; but if I saw it at all, it had the American dollar-mark written all over it. Upon the social side the German is abnormally developed, and to be a "good fellow" is to him a high ideal. He usually belongs to numberless lodges and societies, in few of which he receives any intellectual stimulus. He retains his convivial habits and frequents the saloon, but is seldom intemperate, although the American treating habit often works havoc with his frugality. Another thing which this vast German population has failed to impress upon our cities is the love of law and order which characterizes it in its native home, and almost without exception it stands arrayed against any attempt to curtail the privileges of the saloon and lawmakers, and officials are usually kept from enforcing existing laws by their fear of the German vote. One of the Milwaukee beer-brewers whom I interviewed in regard to his influence upon local politics naïvely said: "No, we have no influence upon politics at all, but if a sheriff or a judge should try to enforce laws against our saloons, he would simply lose his head." The fact is that a certain phase of municipal life is completely controlled by the brewing interest in nearly every city where the German element plays a political part, and that element always rallies to the support and defense of the brewers. It is a strange but general experience that the German immigrant is immediately arrayed against the temperance element; this is due in no small measure to the facts that his first lodging-place is usually connected with a saloon, that the German newspaper almost always ridicules temperance effort and misinterprets the motives of its leaders, and, lastly, that designing politicians make their slogan, "personal liberty," synonymous with a certain kind of lawlessness. The average German comes willing enough to obey all the laws, and, if he has proper environment, develops quickly into the best kind of citizen.

Neither in Milwaukee nor elsewhere did I find that the Church, whether Lutheran or Roman Catholic, had kept pace with the intellectual development of the home Church, nor has it come to feel its social responsibility to the community. The German Lutheran pastors are often more exclusive than the Catholic priests in their unwillingness to co-operate with other churches for the public good; and while the churches in Germany are the most progressive on the Continent, here they are the most conservative, and correspondingly inactive in the affairs which move society. Certain synods of the Lutheran Church, and those the most prosperous, hold to the Augsburg Confession more tenaciously than Luther ever did, and believe that beside that Church there is no Church, and outside of that creed no salvation. I attended a Lutheran church one Sunday evening when it was crowded largely by young people, all of them wage-earners in the lower walks of life, and the whole burden of the sermon of nearly forty-five minutes' length was the thought that salvation is not in morality or merit or good deeds, but that the only thing necessary to it is a proper definition of the nature of Jesus Christ. There was not one ethical

note in the whole sermon, and if it is a fair sample of that man's discourses, his flock of over fifteen hundred souls is feeding upon barren pasture. When I called upon a Lutheran pastor who was pointed out to me as a liberal, I found, upon asking him to define his liberality, that it turned entirely upon social habits and had nothing to do with theology. "I want to drink my beer whenever I want to," was the article in his creed that had driven him into the arms of a more liberal synod. Among the Germans of the Northwest there is a good deal of infidelity, fostered by the Turner societies, but they are languishing and dying, and with them dies the unbelief. I was told in Milwaukee by a business man that the disappearance of those societies is due to the fact that men of affairs discovered that it was poor business policy to belong to them, because it arrayed against them the conservative church element, and that the cessation of infidel agitation is not a sign of more faith, but simply a sign of more common sense. One free-thinking paper is still published in Milwaukee, but its constituency is gradually growing smaller, and the lecturers on infidelity, of whom there used to be many, have dwindled to one or two, and they find it hard to make a living out of a thing that has no life. Yet the German immigrant contributes positive good to this Nation's life; he brings usually a sound body, and while seldom intellectual, he is nearly always intelligent; he is scrupulously honest in business affairs, and has raised the business morals of his community. By his love of music he has robbed the social life in America of some of its sternness, and the German singing societies are known not only for the artistic quality of their performance, but also because they are keeping alive the spirit of good fellowship.

Unfortunately, the German falls an easy prey to the prevailing materialistic spirit, and when he worships mammon he becomes the most ardent of devotees. Then he has no time for his "Gesangverein," nor for anything else which is not utilitarian, and "Geldmachen," the making of money, is his great ideal. In his home life he still emphasizes those virtues which have given inspiration to the German poets' best songs. His wife is, even in America, the model "Hausfrau," for "she looketh well to the ways of her household, and eateth not the bread of idleness." The Woman's Club has touched her but little, and the "Kaffeeklatsch," with its innocent neighborhood gossip, has not given way to the formal reception and kindred social delusions. The German has been the prime factor in dispelling the Puritan idea of the Sabbath, which to many is a positive evil, but may at least be considered a mixed good. Still, he ought not to bear the blame alone, if blame there is; for the disintegrating process which has taken place has been helped along not a little by the thousands of Americans who annually cross the ocean, and who, during their visits in Continental Europe, leave much of the Puritan spirit behind them—too much for their own good and the good of their country.

The German has not largely contributed to the deepening of the religious life of the Nation, although wherever he enters the life of the church he makes its expression more honest. The one thing which he hates desperately is hypocrisy, and because of that he guards himself very jealously and seldom speaks of his religious experiences. The German Methodist and Evangelical Churches, which are of the emotional type, are not only failing to grow, but are perceptibly becoming smaller. This is to be deplored, because they developed a somewhat deep if rather narrow Christian character, and strove to counteract the cold and more formal spirit of the majority of their brethren in other communions. The German in America has not produced many great men, but he has filled this country with good men, which is infinitely better. The cause of the dearth of prominent German-Americans is due to the fact (in some measure at least) that they blend more quickly than any other foreigner (except the Scandinavian) with the Nation's life, especially if the German reaches any kind of eminence, and the effect which he has upon the life of the Nation is difficult to trace just because of that. The coarse, the crude, and the low retain their national stamp, while the finer and better soon become part of us. Some of us seem to know the German best and judge him most from the standpoint of the saloon and all it means; but I have

almost always found him industrious, intelligent, honest, frugal, patriotic, and God-fearing—noble qualities for American citizenship. If he has not risen to the highest which he is capable of reaching, and if he does not exert his influence for the best in all directions, it is not due to the fact that he is not willing to do it, but because he could not rise much higher than the highest marked out for him by the native citizens, or because he could not quite comprehend that this money-making, materialistic Yankee had ideals which he was trying honestly to realize.

If we misjudge the German, he misjudges the American and rates him much lower than he deserves; and this has robbed him of a higher standard for himself and made him exaggerate our National weaknesses, and in imitating them has created a peculiar combination of character which does scant justice to himself or to his American neighbor. When he revisits his Fatherland, these weaknesses manifest themselves most, and then his adopted Fatherland comes in for a good share of the blame for his lack of manners. The following incident illustrates this point. In the lobby of a fashionable hotel in Berlin a German-American of this type was expectorating tobacco-juice with the exactness and frequency of an adept. To a German who called his attention to this nuisance, he replied, "Everybody does that in America." He needs to know the American and value him as he deserves, and he ought to know that which he does not seem to, that the making of money is to the true American, after all, not the greatest of achievements; that the hypocrisy with which he charges him in his citizen's life is less frequent than he thinks it is, and that the National ideal is slowly but surely gaining ascendency. He ought also to know that, more than any other foreigner, he has impressed upon us both his strength and his weakness. It is for us to find out what this strength is and to appropriate it more and it is for him to grow conscious of his weakness and eliminate it from his social life, that he may become indeed one of the strongest pillars of this Republic, which already, like the coming Kingdom, is made up of every nation and kindred and tribe and people under heaven.

The Passing of the County Court

By Katharine P. Woods

AN interesting result of the adoption of the new Virginia Constitution will be the passing of the monthly meeting of the County Court. From the time when the first four counties were set aside, in 1634, until now, the affairs of each of Virginia's counties have been administered by the county officials; but the new Constitution groups two or three counties into a single district, under the jurisdiction of one court, with one judge to each district, thus reducing to something like one-third the old list of courts and officials, numbering a good round hundred.

But the very restriction of the area over which each of the former courts held sway made it a center of social and political life to the community in which it was held; and not only to the immediate neighborhood, for its influence spread far beyond the circle of its legal jurisdiction.

On Court Day the debtor sought his creditor, and the collector looked carefully after his bills; the aspirant for political honors found his readiest audience; and every news item, every jest, and the poorest fragment of gossip found a quick market and a steady rise in value. It was the great monthly event in the life of every man, from the day when, as a small boy, he first made one of the under-foot world upon the green, until he became "one of our most prominent citizens, sir," whose word on whatever topic "carried weight," like John Gilpin. It was by that time a new generation that hung about the groups of men, listened eagerly to the news of the day, drank in and remembered their terms of barter, or turned aside to hearken, awed and agape, to the stentorian and occult cry, "Oyez, oyez, Tom Brown, come into court!" Tom Brown might go, and those immediately interested in his case might follow; the rest of the world stayed outside—kaleidoscopically

shifting and changing; seeking far corners for confidences, friendly or hostile; examining the points of rival horseflesh; selling, bartering, laughing, threatening, and slapping on the back. Here agricultural affairs were best understood, because most thoroughly canvassed—the condition of the crops, the merits of favorite fertilizers, the state of the market, the cost of transportation, and the practical value of the new weather maps and bulletins.

With a curious analogy to the old Indian method of naming the months, though with no traceable connection, some of these court sessions received names that carry with them a vivid touch of local color. Thus, the March court day in a certain eastern county, at which time seed potatoes are a staple of sale, is known as Sweet-potato Court; others are Hog Court and Horse Court; and greatest of all is the midsummer festival, Watermelon Court.

This is a view of things that are passing away. Two years in some localities, six months in others, will see the end. What will take its place? The people, hopeful as the majority are over the new order of things, are already beginning to ask themselves this question. The District Courts, alternating from county to county, are held too infrequently in any one locality to become in any wise social centers. Can farmers' institutes, or farmers' clubs, which have proved so helpful in other places, be made to flourish in Virginia?

A Scientific Study of Mont Pelée[1]

By George Kennan

IN a large octavo volume of 335 pages, illustrated with photographs and maps, Professor Angelo Heilprin, President of the Geological Society of Philadelphia, has given to the public the results of a long and careful study of the Martinique volcano, and a discussion, from a scientific point of view, of the phenomena that it has exhibited since it became active in April, 1902. Although a number of scientists, including Russell, Hill, Jaggar, and Hovey, have written brief reports or magazine articles upon Mont Pelée, Mr. Heilprin is the first professional geologist who has published a book upon the subject; and inasmuch as he has made two separate trips to Martinique, and has had more time for observation, reflection, and study than any of his predecessors in this field, we may fairly look to him for a fuller statement of the facts and a more careful consideration of the problems involved than we have yet had from competent scientific authority.

A glance at the chapter headings of the book shows that its subject matter may be divided into two parts. The first two hundred pages describe the author's visit to Martinique in May, 1902, and give a detailed account of the geography and topography of Mont Pelée; of the destruction of St. Pierre; and of the volcanic phenomena observed by himself or others between April 25 and June 6. The second part contains a record of personal experience in a later visit to the island; brings the history of the volcano up to last September; and discusses the eruptions, their causes, and their effects, in the light of all the observations hitherto made and all the information thus far obtainable. In the first half of the volume there is little that is new, or that imperatively demands notice. The story of the catastrophe of May 8 is retold, with a few additional details; new translations are given of Vicar-General Parel's letter and the last articles on the volcano that appeared in the St. Pierre newspaper "Les Colonies;" and the author's account of his first two ascents of Mont Pelée, originally published in "McClure's Magazine," is reproduced with some amplification and amendment suggested by later experience; but, with the exception of Chapter X., in which the destruction of St. Pierre is compared with that of Pompeii, the first two hundred pages contain little of importance that is wholly new.

In the second part of the book, however, Professor Heilprin has given us an extremely interesting account of the dis-

[1] *Mont Pelée and the Tragedy of Martinique.* By Angelo Heilprin. Illustrated. The J. B. Lippincott Co., Philadelphia.

astrous eruption of August 30, which he witnessed from Habitation von Leyritz on the northeastern flank of the mountain, and a graphic description of a climb to the summit, in a storm of flying projectiles, while the volcano was in a state of violent and destructive activity. The coolness and intrepidity of Professor Heilprin under volcanic fire excited my admiration when we studied Mont Pelée together last May; but he did not then attempt anything so hazardous as an ascent of the mountain while it was in full eruption. On the 30th of August, however, he climbed to the edge of Lake Palmiste through a shower of falling bombs and rock-fragments, and watched, from a distance of only a few hundred yards, a series of explosions that threw dust-charged vapor to a height of five or six miles, with an initial velocity of from 130 to 180 feet per second. That night he saw, at close range, the eruption which destroyed the villages of Morne Rouge, Morne Balai, and Ajoupa Bouillon on the southern and eastern slopes of the mountain, and witnessed another extraordinary display of the stellar or scintillant volcanic lightning which so terrified us at Vivé on the night of May 26. Early the next morning he visited, with Mr. Joseph Clerc, the wrecked village of Ajoupa Bouillon, and there had an opportunity to observe the effects produced by a hot lateral blast from the main crater, which killed more than twelve hundred persons, and which reproduced, on a somewhat diminished scale, the great catastrophe of May 8.

As a result of later experience and fuller knowledge, Professor Heilprin has changed or greatly modified the opinions that he first expressed with regard to the nature of the force by which St. Pierre was destroyed. His first series of observations led him to believe that the horizontal discharge of May 8 consisted mainly of inflammable gas, that St. Pierre was wrecked and its inhabitants killed by an explosion of this gas after it had left the volcano, and that, if superheated steam was present, it played a wholly subordinate if not an absolutely insignificant part in the catastrophe. He now admits, with scientific frankness and candor, that he was probably mistaken, abandons the gas-explosion theory as wholly unsupported by the evidence, adopts the explanation of the phenomena that I suggested in The Outlook soon after my return from Martinique, and says: "It is now clear that the acting force . . . was superheated steam, or superheated steam charged with hot ashes and lapilli." This is also the judgment of the French scientist Professor Lacroix, who says, with reference to the blast that destroyed Morne Rouge, "It is not doubtful that the destruction was due to the action of a cloud of aqueous vapor, highly charged with hot ashes. There is no reason to seek for a combustible gas." (Comptes Rendus, October 27, 1902, p. 672.)

Among other conclusions reached by Professor Heilprin in his survey of "The Phenomena of the Eruptions" (Chapter XIX.) are: (1) that Mont Pelée, in its present period of activity, has not discharged lava in liquid form; (2) that its eruptions, prior to August 24, were not accompanied by earthquake tremors; (3) that none of the eruptions was heralded or preceded by barometric fluctuation; (4) that the main crater of the volcano now occupies nearly, if not precisely, the position of the ancient basin known as the Étang Sec; (5) that the amount of solid matter discharged by Mont Pelée daily, when in a state of moderate eruption, is greater than the amount of sediment carried to the sea in the same interval of time by all the combined rivers of the world, and amounts, probably, to more than eleven billion cubic feet; and (6) that "in the intensity and swiftness of its death-dealing blast, the vast disturbance caused by it in the magnetic field, and the extraordinary brilliancy and remarkable character of the electric phenomena, the eruptions of May 8 and of later date stand unique in the records of volcanic manifestations."

Professor Heilprin's style is generally clear and intelligible, but his language, at times, seems to be that of a cultivated foreigner who has not fully mastered the peculiarities of idiomatic English. Such expressions as "fermenting volcano," "dazzling velocity," "tornadic ferment," "phenomena that construct this extraordinary cataclysm," "human scavengers, prowling about for observation and study," and Martinique "writhing in the coils of the dragon that wrought its earlier

fabric," are not in accordance with the rules of English composition. The proof-reading, too, is open to criticism. Krakatoa, or Krakatao, is variously spelled; "Arabian Knights" (p. 6) is apparently intended for "Arabian Nights;" and "one or two miles an hour," which is given as the velocity of the volcanic blast that destroyed St. Pierre (p. 272), is clearly intended for "one or two hundred miles an hour." These, however, are nothing more than superficial blemishes in a work of great interest and permanent value.

Three Volumes of Criticism[1]

THERE is a Gallic aphorism which runs that "all that is not clear is not French." While it is always difficult to establish a universal proposition, it is certainly true that lucidity is a signal quality of French style; and this virtue accounts, in a measure, for the fact that the French language has been the chief medium in the interchange of the cosmopolitan ideas of civilization. Though admitting the merit of lucidity, detractors of the French have been fain to couple it with the counter-charge of superficiality. But, in our judgment, he is a superficial critic who brings such a charge against French style. The truth is that the French writers, with their exquisite sense of form, are content to present their pearls of thought only in an artistic setting. To get them, however, they have to dive just as deep into the muddle of the profound as the other thinkers, who, regardless of form, leave their ideas in the obscure without a literary setting. The effort to clear up the obscurity often makes the reader believe that he is in the depths of profundity; but the reader often fools himself. If the French save us the trouble of the clearing up, it is ungrateful to call them superficial. As Matthew Arnold said, they have supreme tact in the application of ideas.

These reflections were induced upon our mind as we read Mr. Bliss Perry's study of prose fiction. For he is one of the few American essayists who have complete mastery of the handmaidens of style; and, like the French, with the service of these he can take a large and complicated subject and make it easily and charmingly intelligible. One half of the genius for good writing consists in knowing what not to say, and in this book Mr. Perry vindicates his title to its possession. The knowing reader is constantly aware of the inapt detail which he has put into the basket of reserve. As a consequence, he has written a book in which the essentials stand out like the columns and alto-reliefs of a Greek temple. The ordinary German would have filled a tome and been far less effective.

The author, in the course of his treatment, discusses the relations of prose fiction to the kindred arts, the essential elements of construction, the plot, the setting, the characters, the personality of creative artists, and the short story as the popularly prevailing form. The volume is designed to be a text-book for college classes, and it comes at a time when there is a great need for such a thing, and no adequate work in the field. It is a manual at all times suggestive and inspiring.

Some points which Mr. Perry develops are worthy of emphasis. In the last generation there has been an increasing demand for historical accuracy. Mr. Maurice Hewlett is more true to fact than Scott. People know their history nowadays, and their knowledge is a concern on the author's conscience. It makes him cautious. This in some respects is unfortunate; for as accuracy increases in influence, creative imagination declines, and artistic possibility is limited.

If modern fiction has lost in this regard, it has gained in another. "Art is a bit of nature seen through a temperament. . . . The personality of the artist is a crucible in which the bit of nature is transformed into art." And this transfusing power of personal temperament is stronger and freer to-day than ever. As we revert to mediæval times we find an

[1] *A Study of Prose Fiction.* By Bliss Perry. Houghton, Mifflin & Co., Boston.

The Lost Art of Reading. By Gerald Stanley Lee. G. P. Putnam's Sons, New York.

increasing diminution of the narrator's individuality, hence the flatness of the old metrical romances.

In discussing the short-story, the writer considers it as different from the story that is short. It is a distinctly modern type of art. He compares it to a lyric poem, and applies the principles of Poe's theory. It should be read at a single sitting, and should cast an unbroken spell to make its valid artistic impression. The contemporary taste demands visual imagination of a high order, unique characters, and forces of development that act quickly.

In the review and outlook of American tendencies he finds that in fiction we have not attempted anything parallel to the enterprises of gigantic bigness in the mercantile world. In the main, American fiction has been done on small canvases of real excellence; it has come direct from the soil, and has that optimism and freedom from the morbid which are signs of national health and promise.

There are still many intelligent people who would rather take Browning's greatness on faith than read his works. The poet, indeed, is recognized; but the ribald have not yet ceased to jeer, nor even some of the judicious to grieve. Browning's verse can always pass the primary test—that great poetry should be a profound interpretation of life; but when it comes to the second—that poetry must be phrased in terms of artistic beauty—very many of his poems must be disqualified from the ranks of the elect. His lapses so often quench our enthusiasm and rapture. There are many moments when he is under the influence of supremely creative impulses, when reason, emotion, and intuition are in artistic equilibrium; yet there are just as many others when, like Balzac, his imagination lags in the traces, and his mere intellect runs fast and loose. If Browning is to endure for the ages, he will live, as in Wordsworth's case, in a body of selections. We trust there never will be a generation of men reluctant to cherish such things as Abt Vogler, Saul, Prospice; nevertheless, we feel sure there are generations to come who will shelve Sordello, the Epistle to Karshish, Caliban, as we to-day shelve that English writer—so distinguished in his own day—the metaphysical Abraham Cowley.

A reading of Mr. Stopford Brooke's "Poetry of Robert Browning" confirms the reviewer's opinion that while much of the poet's work will be saved by the instinct of self-preservation in the race, a large part will inevitably perish in the struggle for the survival of the fittest. "It is all very well," remarks Mr. Brooke, "for his students to say he is not obscure; he is. . . . Nor is it by any exceptional depth of thought or profound analysis of soul that Browning is obscure. It is his style. He is negligent to a fault, almost to impertinence." He lacked regard for his public; he lacked reverence for his art; and where he has offended most, art and the public will visit upon him the subtle revenge of neglect.

Mr. Brooke's volume brings forth a great many points, some old, some new, about the poet's divinely endowed yet, in many respects, fantastic personality. "The Jew lay deep in Browning." He was Jewish in taste and in his sense of the ever-enduring righteousness at the heart of the universe. His intellect was English in its optimism, its steadfast fighting quality, its unyielding energy; his imagination, on the other hand, was an expatriate. It wooed that "woman's country," for its earthly delight, forgetful of home. And this predilection for foreign settings and alien atmosphere accounts in some degree for the absence of popular appreciation among English readers.

The inspiring element in Browning's poetry is his militant faith. He was certain of his hope amid all the hurly-burly of a skeptical age. This makes him a better poet to live by than Tennyson. "For Tennyson, though he had hope, was often uncertain about it, and bewailed his uncertainty." Browning's theory of life conceives that man is a fledgeling whose business on this earth is to grow wings. He saw clearly the limitations which retard that growth; he saw also that the spirit in its plight was helped by nature, by humanity, by God. His impulse is ever upward; to dwell on the ground and brood aimlessly was submission, and submission was damnation. Nevertheless, while romantic as an artist, while, like Shelley the "sun-treader," his first inspirer, he was restless and unsatisfied, Browning always maintained the sane poise of a man of this world. Though he saw life's

limits, he made up his mind to work unceasingly within them, knowing that suddenly "the worst turns the best, to the brave." He was no anchorite, crucifying the flesh. He was rather a spiritual epicurean. "It is one of the root ideas in Browning that peace is not won by a repression of the noble passions, but by letting them loose, in full freedom, to pursue after their own highest aims."

The content of Mr. Brooke's volume shows that he has been a careful and loyal student of the poet. When, however, one comes to consider his critical method and his form, one cannot feel that his work attains the standard of the highest criticism. His style is wordy and tinctured with cheap rhetorical conventions. In his endeavor to be comprehensive he fails in that bold relief which gives distinction to the essential. Much of the material is transcribed rather than assimilated, and much, too, is more like a mere guide-book with running comments. Arnold, in his literary hunts, had the rare virtue of capturing a single quarry. Mr. Brooke, like an unskilled sportsman, sometimes beats around the bush and simply starts up the game. In spite of this defect, however, his volume is one of the first which we should desire as an aid in the study of Browning.

Mr. Gerald Stanley Lee, in his "Lost Art of Reading," evidently believes that critics, like the heathen, will be heard for their much speaking. His volume is bulky; the intrinsic value is slight. The author seems to feel that the time is out of joint and that it is his business to rail; and he does so in some four hundred and fifty pages. The objects of his attack are modern civilization, educational methods, the misuse of books, the conduct of librarians, and incidentally anything else that comes into his mind. In some ways he is a follower of Ruskin; he thinks that men are willfully blind to the beauty of life and neglectful of their earthly heritage. The hustle and feverish restlessness of the latter-day world prevent real living. "The typical civilized man," he writes, "is an exhausted, spiritually hysterical man because he has no idea of what it means to face calmly with his whole life a great book a few minutes a day, to rest back on his ideals in it, to keep office hours with his own soul." Mr. Lee appears to have Rousseau's idea that, since society corrupts man, he should take to the woods. There is something in the thought, although it is to be discredited, on the whole, as impracticable. Voltaire remarked that Rousseau talked so eloquently on the subject that he was tempted "to get down and go on all fours." Mr. Lee indulges in a great deal of Emersonian aphorism which is often brilliant; the total impression of his book, however, is that of diffuseness and eccentric egoism. There is enough good material to make a small volume of excellent essays. His manuscript should have been boiled down relentlessly, and the author's whims and caprices should have been expunged.

Correspondence

The Gifts of Millionaires

I.

To the Editors of The Outlook:

I find that your issue of January 10 contains a criticism of the views which I expressed in a recent Western trip. The facts are not correctly given, but the question is fairly put and squarely met. It is this: Is the president of a college—usually the chief figure in such a transaction—at liberty to solicit or to receive the gifts of a millionaire whose money is known to have been wrongfully secured? Such an act seems to me to be censurable and mischievous. My critic thinks, with equal decision, the reverse. The question is one of immediate moment.

The first affirmation by which the criticism is made good is that such gifts cannot be rejected without first establishing a standard of business morality, and that there is much variety in these standards. This state of things, instead of being a reason why the head of an educational institution may be without a standard of business morality to guide his own action and influence the action of others, is the chief reason why he should carefully frame and constantly defend such a standard. It is not our calling to give guid-

ance where no guidance is needed, but where it is needed. We frame principles for the very purpose of correction.

The second supporting consideration is that, if such a standard is set up, it is impossible to apply it in specific cases. It is impossible for boards of trustees to determine whether wealth offered for public use has been righteously earned. But the question is, whether money that is known to be unrighteously acquired is to be solicited and accepted. The way in which the wealth of the Standard Oil Company has been gained is notorious. Articles, books, the reports of Congressional committees for thirty years, have made it so. No intelligent man can plead ignorance. If I should say to my class, "Monopoly is in itself a great wrong and can only be established in connection with many other wrongs," and one of the students should ask, "How about the Standard Oil Company?" and I should respond, "I know nothing about the Standard Oil Company," I should escape the suspicion of being a fool only by the suspicion of being a rascal. The answer is the same as that given before. It is the duty of the man who guides instruction to frame standards and to give them correct, concrete application. This is his function. It is a novel principle in morals that, as one does not know all things, he need give himself no trouble to know anything; that because one does not see distinctly the obstacle on the horizon, he may stumble over the stone under his feet.

The critic proceeds to affirm that his rule does not hold in the rare cases in which a redress is possible of the wrong done. How is one to know whether redress is possible if he is at liberty to take money in complete ignorance? If the claims of the hundreds who think themselves to have been wronged in business relations by the Standard Oil Company were entertained, its gifts would be swallowed up in an instant.

But the critic urges that there is every degree in wrong-doing. Certainly; but a large share of the questions of life are questions of degree. How dishonest may my partner be and I still do business with him? How corrupt may a political party become and I still support it?

But, it is said, the instruction is not affected, and ought not to be affected, by the want of integrity in those who sustain it. Neither of these propositions is true. I shall mention no names, for these would introduce confusing considerations. Two professors of sociology, men of marked ability, original investigation, and sober opinions, have lost their positions some time since and have never been restored to college work. One of these was mentioned to a college president as a suitable person to fill a vacancy. The response was, "I cannot appoint him. I shall retire shortly, and I do not know from whom my successor will wish to obtain money." There is worldly wisdom for you, heaped up and running over. To suppose that the same man will accept Rockefeller's money and condemn Rockefeller is to imagine that a president in the same act will fall below the claims of honor and rise up to those of duty. The critic plays his men as if there were not a particle of human nature in them, and as though they would turn up black or turn up white, precisely as he might wish.

The question is easily settled. The proper time to express an opinion is before the gift is completed, while there is still freedom of action on both sides. Say to Mr. Rockefeller—and to the public, as the transaction is a public one—"I utterly repudiate your methods," and then see how large a gift will be received. If a president should say at an annual meeting of alumni, "The college has secured another large sum from Mr. Rockefeller, but as there is a general feeling against his methods of business, I must improve the occasion to remark that the Standard Oil Company is a heartless monopoly and that its officers have done more to debauch business morality than all the thieves behind prison bars." The alumni would look in all directions for an exit from the cruel dilemma put upon them, searching for it with as much eagerness and jostling as men manifest in escaping from a burning theater. Mum is the word, the best word, and the only proper word, in such transactions.

Let us cast off the works of darkness and put on the armor of light. Have no fellowship with the unfruitful works of darkness, but rather reprove them. Certainly these precepts should meet with

some recognition in a divinity school and in a Christian college, so called.

JOHN BASCOM.
Williams College, Williamstown, Mass.

II.

To the Editors of The Outlook:

The editorial in The Outlook of January 10, entitled "The Gifts of Millionaires," does not seem to me to meet the question raised by Mr. Hobson and Dr. Bascom. I have not seen either Mr. Hobson's or Dr. Bascom's full statement, but the moral principle to which they refer seems evident in the quotations which you make. Their contention, as I understand it, is not that a charitable institution, such as a college, must trace back to its origin each gift to find whether it was honestly come by or not, but rather that there are conditions attached to certain gifts which make their reception impossible to an institution which aims at leadership in moral and intellectual matters.

Let me illustrate. Suppose a citizen of New York should come to the authorities of Columbia College and say: "Here is a million dollars to be used in the work of the College. I have made it dishonestly, but in such wise that it is impossible to return it to those from whom it came. I ask no recognition for myself, but am satisfied to know that the money is put into useful channels." Without doubt Columbia College would be entirely right in accepting this gift.

On the other hand, suppose that William M. Tweed, in the heyday of his career, had come to the authorities of Columbia, and said: "Here is a million dollars to found a school of political science which is to bear my name." Columbia could not have accepted that gift and maintained its moral leadership.

In other words, there is a line of demarcation, not always hard to distinguish, which separates the gift which may be accepted from that which may not; but this line, as you rightly say, cannot be drawn by inquiry into the origin of these gifts, but is rather revealed by the conditions which are attached to them. When the acceptance of a gift carries with it a tacit excuse for past misdeeds, when it involves the placing of a name which stands for violated law and disregard of the rights of men side by side with the names of the great and of the unselfish, when it implies the recognition of a false measure of success—a thing most common in our American life—then the college which accepts such a gift suffers in its moral leadership; its action goes far to confuse in the minds of men the distinction between right and wrong, and between unselfish and selfish public policy; or, as George Eliot so aptly expressed it, such action tends to "debase the moral currency."

As I understand Mr. Hobson and Dr. Bascom, it was this distinction which they made, and not that which The Outlook discusses. Would you have advised Columbia to accept a bequest from Mr. Tweed? If not, do you hold that an institution of learning must await the civil trial and conviction of a well-known man before its officers can decide whether that man's career stands for a sound public policy or a harmful one?

HENRY S. PRITCHETT.
Massachusetts Institute of Technology.

[The foregoing letter of Dr. Pritchett, President of the Massachusetts Institute of Technology, in our opinion satisfactorily answers Dr. Bascom's letter. Dr. Pritchett implies, though he does not explicitly state, the principle that, it appears to us, should govern university trustees in all cases of debatable gifts of money. This is that it is not the business of trustees to trace back the money to its source and decide whether the money offered to them has been honestly or dishonestly made, except in the rare cases in which they have reason to believe that the money does not belong to the donor because it could be given back to the original owner. But, on the other hand, it is their duty to consider all that is expressed or implied in the deed of gift. We should not think that Columbia University could have accepted a gift from William M. Tweed "to found a school of political science which is to bear my name," because the condition "to bear my name" would necessarily involve the honoring of Mr. Tweed. What Mr. Hobson, as reported, explicitly claimed, and what Dr. Bascom claims in his letter printed above, that it is the duty of trustees to trace money to its source and refuse to accept it if in their judgment the money has been acquired by the donor by immoral methods, The Outlook thinks is untenable.—THE EDITORS.]

Books of the Week

This report of current literature is supplemented by fuller reviews of such books as in the judgment of the editors are of special importance to our readers. Any of these books will be sent by the publishers of The Outlook, postpaid, to any address on receipt of the published price, with postage added when the price is marked "net."

Art of Disappearing (The). By John Talbot Smith. William H. Young & Co., New York. 5½×8¼ in. 367 pages. $1.50.

Art of Speaking (The). By Ernest Pertwee. Illustrated. G. P. Putnam's Sons, New York. 5×7½ in. 122 pages. $1.

Beacon Lights of History: The World's Heroes and Master Minds. By John Lord, L.L.D. In 15 vols. Illustrated. James Clarke & Co., New York. 6×8¼ in. $50 per set.

It has become a generally accepted belief that books published by subscription lack taste in their outward form. Here is a notable exception. These fifteen volumes could hardly be excelled in paper, binding, print, and form generally. They make up a new library edition which can be cordially and highly praised. The illustration also is adequate and extensive. As to Dr. Lord's lectures themselves, their painstaking accuracy and popular methods of presentation have long been recognized. The scope and extent of ground covered are really remarkable. For forty years the various series have been delivered before literary institutions and special classes in many cities, and they have proved eminently acceptable. Dr. Lord has in his own way contributed substantially to the education of the people, and we have here in permanent form the results of a very extended treatment of the history of civilization from the earliest times to recent days.

Biographic Clinics: The Origin of the Ill-Health of De Quincey, Carlyle, Darwin, Huxley, and Browning. By George M. Gould, M.D. P. Blakiston's Sons & Co., Philadelphia. 5×8 in. 223 pages. $1, net.

Birth of Berea College: A Story of Providence. By John A. R. Rogers. Henry T. Coates & Co., Philadelphia. 4¼×7 in. 174 pages.

A little book dealing with a great subject; a chapter in the higher life of the country, of great interest to all who care for education in America, and of still greater interest for all who care for American character. It is the record of a typical American enterprise, begun with the fewest materials but with the highest aims, and established on the strongest foundations by a rare combination of idealism and practical good sense. If this little book could get into the right hands, it would render service to many persons of means who are looking for the right places in which to invest a part of their capital.

Boy's Iliad (The). By Walter Copland Perry. Illustrated. The Macmillan Co., New York. 5×7½ in. 411 pages. $1.25.

Boys who have read Mr. Perry's "Boy's Odyssey," and grateful parents who have read [illegible] boys' version (not only for their children [illegible] themselves), will gladly welcome Mr. "Boy's Iliad." It is true that Achilles [illegible] the engaging character of Ulysses, and it is certainly true that the adventures of Achilles were not half as interesting or as picturesque as were the adventures of Ulysses. But Mr. Perry has succeeded in making a book of signal worth to every lover of boys, of good stories, and of sound literature.

Civil War Times, 1861-1865. By Daniel Wait Howe. The Bowen-Merrill Co., Indianapolis. 5½×8 in. 421 pages.

Constructive and Preventive Philanthropy. By Joseph Lee. The Macmillan Co., New York. 4½×7 in. 242 pages $1, net.

Reserved for later notice.

Cuentos Castellanos. Selected and Edited by Mary D. Carter and Catharine Malloy. D. C. Heath & Co., Boston. 4¼×6½ in. 200 pages.

Egregious English (The). By Angus McNeill. G. P. Putnam's Sons, New York. 5×7¾ in. 210 pages.

An answer to "The Unspeakable Scot." There is something essentially childish in these attempts to attract attention and sell books by holding up to ridicule a nation's failures and weaknesses and ignoring its greatness and fine traits. Irony and caviling continued for two or three hundred pages becomes wearisome, even though, as here, many clever hits are made.

Deeper Teachings of Plant Life (The). By Hugh Macmillan, D.D., LL.D., F.R.S.E. Thomas Whittaker, New York. 5×7½ in. 386 pages. $1.20, net.

This book is not as formidable as its title might lead one to imagine. It consists of a "collection of popular studies" on the commoner flowers and trees, and the suggestions that they make to one who is looking for explanations, sees God in nature, and delights in beauty. The glaze on the flower of the buttercup, for instance, which serves as the subject of one study, suggests to the author, on the one hand, the long process by which this flower has become adapted to its environment, and, on the other hand, its apparent liking for human companionship. Those who enjoy meditations on the "Poetry of Plants," to use the running title of the book, will find these studies pleasant and helpful.

Egypt. Painted and Described by R. Talbot Kelly. The Macmillan Co., New York. 6¼×9 in. 240 pages. $6.

Very delicately and charmingly painted are the pictures of Egypt here skillfully reproduced in color-printing. The pen descriptions of the land of the Nile are written easily, and will recall to all travelers the atmosphere and indescribable delight of Egyptian journeys.

England and the Holy See: An Essay Towards Reunion. By Spencer Jones, M.A. (Second Edition.) Longmans, Green & Co., New York. 5×7½ in. 264 pages. $1.50.

French Engravers and Draughtsmen of the XVIIIth Century. By Lady Dilke. Illustrated. The Macmillan Co., New York. 7½×11 in. 227 pages. $10.

Reserved for later notice.

Gardens Old and New: The Country House and Its Garden Environments. Vol. II. Edited by John Leland. Illustrated. Charles Scribner's Sons, New York. 9½×14 in. 284 pages. $12, net.

This second volume of "Gardens Old and New" is a welcome addition to the rapidly increasing library of garden literature. It is first of all a book of large and beautiful pictures, from photographs by Charles Latham. These illustrations, which set forth the striking features of seventy-six formal gardens in England, are accompanied by brief descriptions of the gardens and discussions relative to the growth of the garden idea. In view of the wide interest in this subject, it is gratifying to have a book that tells us how the wonderful garden development of the English country seats has been accomplished. The volume is rich in suggestions for those who have gardens of their own, and it will be cherished by all who love the beautiful.

German Revolution of 1849 (The). By Charles W. Dahlinger. G. P. Putnam's Sons, New York. 5½×8½ in. 287 pages. $1.35.

The publication of General Franz Sigel's account of the German Revolution in 1848–49 calls attention to another work by a less well-known author, but also of singular merit. It portrays a period which, however disappointing in its ultimate outcome, was of considerable significance as indicating the breadth of the general democratic wave which swept over Europe in those years. Great things were accomplished by that noble impulse, especially in France, Austria, and Italy. If in Germany the permanent results seem slight, we may remember that the Fatherland had already begun its Prussianizing. A Government of arrogant absolutism triumphed and remained in power until 1870, when it was replaced by the present more liberal (although not sufficiently liberal) imperial representative government. Mr. Dahlinger's description of the death-struggle of democracy in Germany is both clear and spirited. On every page also it bears the marks of intimate knowledge; the author has enjoyed a manifest advantage in being able to derive most of his facts from his father, and from other friends who were participants in the struggle. Some of the most notable participants came to this country—Brentano, for instance, the civil leader of the Revolution, later editor of the Illinois "Staats-Zeitung;" Franz Sigel, the military commander of the Revolution, who, at Carthage, Mo., was to gain the earliest victory for the North in our Civil War; finally, Carl Schurz, coming from his early army life in Baden to fight in America under Sigel, his old commander, and himself to become an American Major-General, a diplomat, United States Senator, Secretary of the Interior, a notable publicist and writer. Mr. Dahlinger throws new and interesting light on just why the Revolution was so strong in the southwestern corner of Germany.

Highways and Byways in London. By Mrs. E. T. Cook. Illustrated. The Macmillan Co., New York. 5½×8 in. 480 pages. $2.

This is neither a guide-book nor a history, but it may be cordially commended to travelers as well as to the general reader. It is a pleasant, discursive, anecdote-relating sort of a book, which makes the most of all the picturesque literary, biographical, and historical associations of London. It is an excellent supplement to Baedeker because it is as unlike that work as possible. The pictures are by Hugh Thomson and others. Much as we admire Mr. Thomson's work, speaking generally, we do not think he is at his best here.

History of Siena (A). By Langton Douglas. Illustrated. E. P. Dutton & Co., New York. 6×9¼ in. 500 pages. $6. net.

In Mr. Douglas's recent admirable monograph on Fra Angelico we saw how mistaken conceptions of the Dominican artist had become prevalent because historians and critics of painting in the first place had neglected the study of the history of Renaissance architecture, and, secondly, had failed to comprehend the true character of that religious movement in the Roman Catholic Church of which the friar was the chief artistic representative. In the present volume Mr. Douglas seeks to show—and has succeeded in showing—that no one can understand either the political history or the artistic history of Italy, or of any part of Italy, if one neglect either politics or art. We are glad that, instead of following up a subject already begun—Fra Angelico—and giving us a history of Florence, Mr. Douglas has devoted his attention instead to Siena. Of Florence we already have histories a-plenty, but of Siena there is, so far as we know, no complete history in any language. In the Italy of the Middle Ages and of the fifteenth and sixteenth centuries Siena played an important part, and in this volume we grasp that part as never before, while some great figures in Sienese history also stand out as never before—San Bernardino, St. Catharine, Pius II., Petrucci, Quercia. The volume is adorned with many pictures especially illustrating the latter half of the work, which is devoted to a description of Sienese architecture, sculpture, painting, and other arts. The illustrations by no means interfere with the thin paper on which the text is clearly printed, and do not make the volume of five hundred pages heavy to the hand. Finally, the cover is practical, may be handled without spoiling, and is also æsthetic, as befits the subject of the text.

Jane Eyre. By Charlotte Brontë. (New Century Library.) Thomas Nelson & Son, New York. 4×6¼ in. 517 pages.

A very attractive edition of this striking story, in flexible leather covers, printed on thin paper from large type, small enough to put into the pocket, but meeting every requirement of the fastidious reader.

John Inglesant: A Romance. By J. Henry Shorthouse. In 3 vols. The Macmillan Co., New York. 6×9¼ in.

A dignified and almost sumptuous edition in three large volumes, beautiful in type and

paper, and gratefully light in hand. A portrait of Mr. Shorthouse reveals a singularly interesting and unusual type of face, as might be expected with the author of a book which is truly unique in English literature.

New International Encyclopædia. Edited by Daniel Coit Gilman, LL.D., Harry Thurston Peck, Ph.D., L.H.D., and Frank Moore Colby, M.A. Vol. V. Illustrated. Dodd, Mead & Co., New York. 7×10 in. 842 pages.

Nova Solyma, the Ideal City; or, Jerusalem Regained: An Anonymous Romance Written in the Time of Charles I., Now First Drawn from Obscurity, and Attributed to the Illustrious John Milton. By Rev. Walter Begley. Charles Scribner's Sons, New York. In 2 vols. 5×9½ in. $5, net.

Reserved for later notice.

Quest of the Holy Grail (The): An Interpretation and a Paraphrase of the Holy Legends. By Ferris Greenslet, Ph.D. With Illustrations from the Frieze Decoration in the Boston Public Library by Edwin Austin Abbey, R.A. Curtis & Cameron, Boston. 8×10½ in.

A very attractively printed quarto, which contains stories taken from Sir Thomas Malory and from other authors, and illustrated with reproductions, not wholly successful in several instances, of Mr. Abbey's striking mural paintings in the Boston Public Library.

Religions of Ancient Egypt and Babylonia (The): The Gifford Lectures on the Ancient Egyptian and Babylonian Conception of the Divine, Delivered in Aberdeen. By A. H. Sayce, D.D., LL.D. Charles Scribner's Sons, New York. 5½×8½ in. 509 pages. $3.50, net.

Those who are interested in comparative religion will find this latest work of a distinguished Orientalist most valuable. It is, of course, as related to our religion that the religions of those to whom we trace back our civilization are chiefly interesting. The points of resemblance between the religions of Babylon and Jerusalem, between the Egyptian and the Christian religion, have by no means escaped notice till now. Now, however, Professor Sayce, by the light of the most recent researches, has exhibited the parallels and the contrasts as fully as they are now perceptible. The religion of Egypt, though better understood than the Babylonian, can even now be outlined only in general principles and fragmentary details. To reconstruct it from its relics in our possession would be like reconstructing the religion of Englishmen "from a few tattered pages of Hume or Burns, of Dugald Stewart or Sir Walter Scott." And yet it is discovered that, whatever the grossness of the popular superstitions, the cultured few in Egypt attained to religious conceptions both pure and sublime. We are in some things their heirs, and their theories, variously transformed, enter into modern religious thought. The continuity that links Christian thought to that of early Egypt links that also through Judaism to the thought of primitive Babylonia. Fresh discoveries only augment the known resemblances between the ritual of Israel and that of Babylon. "The Mosaic law," says Professor Sayce, "must have drawn its first inspiration from the Abrahamic age." Of this positive proof appears in the recently ·ered code of King Hammurabi of n, about 2250 B.C. To study these ancient religions is to study the background of Christianity, and the germinant thoughts and aspirations which find in Christianity their explanation and fulfillment. In such a study sympathetic appreciation and discriminating criticism are in these lectures felicitously joined.

Round the Horn Before the Mast. By A. Basil Lubbock. Illustrated. E. P. Dutton & Co., New York. 6×8 in. 375 pages. $2, net.

The author, a young Englishman fond of adventure, sailed in a four-master from San Francisco to England as a sailor before the mast. His experiences bring out the life on a sailing vessel as have hardly any other books of the sea except Dana's "Two Years Before the Mast." He is a cheerful young man, took ill fortune, accident, and hardship as all in the day's work, and seems really to have enjoyed bad food, hard work, plenty of abuse, and frequent danger. There is not much of the imaginative quality that is to be found in Joseph Conrad's stories, nor of the vivid narrative of Mr. Bullen, yet the book is essentially readable. It is not pleasant to find often repeated as a matter of general knowledge the assertion that American ships have a much worse reputation for brutality than British vessels, but it may be said at least that the particular British ship here described was far from being a nautical paradise. There are a few good pictures.

Some Features of the Faith: A Popular Discussion of Certain Cardinal Points of Christian Doctrine. By John Arthur Shaw, M.A. The Young Churchman Co., Milwaukee. 5×7½ in. 306 pages. $1.25, net.

Social Unrest (The): Studies in Labor and Socialist Movements. By John Graham Brooks. The Macmillan Co., New York. 5×8 in. 394 pages.

Reserved for later notice.

United States Catalog (The): Provisional Edition. Edited by Marion E. Potter, B.L. Second Edition. H. W. Wilson, Minneapolis, Minn. 6½×10 in. 1,130 pages.

Week in a French Country-House (A). By Adelaide Sartoris. Illustrated by Lord Leighton. The Macmillan Co., New York. 5×7¾ in. 221 pages. $1.50, net.

The author of this book, Adelaide Sartoris, belonged to a gifted English family, and the book shows on almost every page the power of observation, the dramatic instinct, and the sensibility of a family which has given the English stage several of its best actors. Written in a most familiar way, and pretending to be the simple record of a visit in a French country house, the book reminds one in its quality of "Elizabeth and Her German Garden." It is full of the same out-of-door atmosphere; it has the same charm of style; it is not, however, filled by the same humor; it is much more serious, and the story element in it is much more pronounced. In a way, it is a complete story, but the story is beautifully set against a background of French domestic life and of French landscape, charmingly sketched, rich in passages of rarely felicitous description. It is a book which will appeal to a very large constituency of readers at a time when the love of nature is so widely shared.

RHEUMATISM

Tartarlithine

gives better results than any other remedy for Rheumatism. The promptness of its action is in many cases astonishing. Does not affect the heart nor irritate the stomach.

Prescribed and endorsed by the leading physicians of the country.

The Outlook is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The first issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

Price.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

Postage is Prepaid by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila Samoa, Canada, and Mexico. For all other countries in the Postal Union add $1.56 for postage.

Change of Address.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

Discontinuances.—If a subscriber wishes his copy of the paper discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

How to Remit.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of THE OUTLOOK COMPANY. Cash should be sent in Registered Letter.

Letters should be addressed:

The Week in Congress

In the Senate, as Senator Dietrich, of Nebraska, observed last week, everything has remained "in statu Quay." The Pennsylvania Senator's Statehood Bill holds the right of way, and practically nothing else can get a hearing. A majority of the Senate will plainly vote for the bill if it is brought to a vote, but those who are filibustering against it have in their favor the fact that many members of the majority are not strenuously enough in favor of the bill to hold a continuous session until it is passed. A continuous session is a much more trying ordeal for the supporters of a bill than for its opponents—if the latter are at all numerous—for the opponents merely need to keep enough members in the Senate to prolong the debate, while the supporters must obtain a quorum to prevent adjournment. Last week Senator Quay indicated doubt about his ability to keep his measure before the Senate when the appropriation bills demand attention, by getting his bill introduced as an amendment to the agricultural appropriation bill. This policy of grafting general legislation upon appropriation bills in the form of "riders" has long and justly been condemned, and the Senate has a rule against the introduction of such "riders" if they be not germane to the bill on which they are saddled, but it has never been strict in its definition of the word "germane." The friends of an amendment seem usually to vote that it is "germane" to the bill amended, but the relations of Statehood to agriculture are admittedly remote. The Cuban treaty and the Philippine relief bills are the measures held back by the Statehood debate. The Panama Canal treaty is allowed consideration, and is likely to pass. Senator Morgan seems to be its only determined opponent, and he declares that he has no intention of filibustering against it. The Militia Bill, in the form in which it has become a law, merely provides for the uniform arming and disciplining of State troops, chiefly through appropriations from the National Treasury to pay for the arms furnished and the detailing of National officers to exercise a certain supervision over the drill. The original proposal that an army reserve of 100,000 trained men should be enrolled in the various States under the command of the President, with obligation to serve wherever ordered, was eliminated by the Republican leaders in the Senate after it had been accepted by the House. The opposition to the creation of a regular army reserve of 100,000 men was led by Senator Bacon, of Georgia, and supported with unexpected vigor by nearly all the Democrats. Under the bill as passed there is no new army reserve, and the State militia systems remain under State control, though equipped and drilled so as to fit them for effective co-operation in case of National need.

The New Silver Complications

President Roosevelt sent to Congress last week a report of Secretary Hay inclosing and indorsing a proposal from the Mexican and Chinese Governments that the nations having Oriental dependencies should join with the independent silver-using countries in "establishing a definite relationship between their gold and silver moneys," so as to prevent further fluctuations in the rate of exchange. These fluctuations are a serious embarrassment to commerce between the gold and silver using countries, as the merchants on neither side can tell just how much they are paying or getting for the

goods they buy and sell. There are no figures showing that these uncertainties have prevented foreign commerce, but the Chinese memorandum holds out to us the possibility that with a stable rate of exchange our exports to China might increase from $200,000,000 a year to $1,200,000,000! This latter total, it points out—after the manner of Colonel Sellers—would only require Americans to sell $3 worth of goods a year to every man, woman, and child in the Celestial Empire. The Mexican and Chinese memoranda both make it clear that the gold-using nations are not asked to change their own monetary systems by restoring the free coinage of silver, but merely to legislate in such a way for their Oriental dependencies that gold and silver money may be interchangeable at a definite ratio. Just how this end may be secured is not made entirely clear. It is suggested that the Philippine currency bill recently defeated in the House offers the kind of a plan desired; but this bill merely provided that Philippine silver money should be kept at a definite ratio (32 to 1) with gold money, by limiting the amount of silver coined and establishing a gold reserve to insure exchangeability. Any nation can take this action to keep its own silver money at par with gold, but no nation can guarantee that the silver money of any other nation shall be kept at par with gold, for it cannot limit the amount coined or use its reserve to keep the excessive coinage of another country from going to a discount. Such a plan could have no effect to steady the value of silver bullion, for the nations joining in it must each close their mints to the free coinage of silver and thus send the commercial value of that metal down to a still lower level. The plan of a union does not seem to us at this writing feasible, but we recognize the desirability of a fixed ratio of exchange for international commerce, and the Mexican and Chinese proposals should receive all the consideration that the importance of the end in view demands. The mere fact that these countries desire a better commercial understanding with the other nations is of great significance, and, whatever final result may come from the negotiations, their request for a mutual conference by means of a joint commission should receive a hearty welcome from the American people.

The Doblin-Lessler-Quigg Story

The tale of attempted bribery which has been recounted before a committee in Congress for about two weeks has aroused a popular suspicion of legislative methods which cannot easily be allayed. The story is briefly as follows: Among the plans for the enlargement of the navy has been a proposal that the Government should purchase a number of Holland submarine torpedo-boats. Representative Lessler, of New York, who has been an opponent of this proposal, announced to the House Committee on Naval Affairs that he had been approached by a man named Doblin with an offer of $5,000 on condition that he should support the proposed measure. This offer purported to come from Lemuel E. Quigg. When brought before the Committee Mr. Doblin confirmed this statement, and added that he had been told that there was possibly "$1,000 in it" for himself. Mr. Quigg, being thereupon called upon to testify, denied unequivocally that he had made any offer of money, but admitted that he had spoken to Mr. Lessler "on behalf of a friend" whom he wished to oblige. Mr. Doblin, summoned again before the Committee, retracted his former story, and declared that he had told it as a favor to Representative Lessler in order to substantiate the charges. In addition to this offer of money, Mr. Lessler had declared that political pressure had been brought to bear upon him by means of threats from John McCullagh, Chief of the Bureau of Elections in New York, that men who had made and could unmake Representative Lessler politically, willed that he should vote in favor of purchasing the boats. Mr. McCullagh in turn disclaims making these threats. So the matter stands, with but two points clear: that Mr. Doblin, on intimate terms with Representative Lessler, apparently considered by Mr. Quigg as fit to be recommended for political office, and a deputy under Mr. McCullagh, is clearly, no matter which statement of his may be accepted, a perjurer, and that some one else is clearly guilty either of subornation of perjury or of bribery. This is the sort of occurrence that has created in the minds of many good citizens the idea that political affairs are corrupt, political practices underhand, and politicians conscienceless.

This idea, already too prevalent, will be made only more widespread by any effort at concealment out of regard for the feelings even of men who are unjustly involved. A searching investigation is the only means by which the House of Representatives can convince honest men that it discountenances such dishonesty. The first step in this investigation should be the indictment of Mr. Doblin for perjury. Perhaps a prospect of the State's prison before him, from which he could not be delivered by political influence, might result in getting some substantiation of the true story. If not, still the country would have satisfaction in knowing that perjury does not remain unpunished even if bribery does.

❀

The Venezuelan Question It is to be hoped that the delay and disagreement as to the terms of a settlement between Venezuela and the allied Powers (Great Britain, Germany, and Italy) will not prevent the adoption of some plan fair and acceptable to all concerned. The new German Minister, Baron von Sternburg, has but just arrived in Washington, and is energetically striving to familiarize himself with the situation. He has already sent to his Government a full statement of his understanding of the situation. The diplomatic discussion last week turned around the point involved in President Castro's unwillingness to give Germany and Great Britain a position as preferred creditors in any arrangement reached for pledging Venezuela's customs for her debts. Not unnaturally, the allies who have by a display of force brought about the crisis think that their claims should first be satisfied, and have refused to raise the blockade until they are assured on this point. Of the other creditor nations, France has notified Venezuela that, by a convention between the two countries in 1867, France was authorized to collect customs directly in Venezuela, and renounced this right in 1885 with the express condition that interest should be paid regularly. This has not been done, and France intimates her intention to enforce her rights. The other claimant countries have shown no uneasiness. A compromise plan was suggested providing that the allies should have preference for their claims, but only for a short time. The representatives of the allies at Washington have submitted this plan to their Governments, but it has been positively rejected by those Governments.

❀

Present Duties in the Philippines At a mass-meeting held in Cooper Union in New York City last week to consider "Present Duties in the Philippines," Mr. Edwin M. Shepard, the intellectual leader of the Democratic party in that city, speaking upon the "Immediate Needs" of the islands, gave his cordial support to the three measures urged upon the present Congress by the President and Secretary Root. Congress, he declared, should at once reduce the taxes imposed on Philippine products sent to our markets, should at once give the islands a stable currency, and should at once appropriate the three million dollars asked for to relieve the appalling distress among the people. He said that he had not changed his attitude toward the policy which had imposed upon us our present responsibilities in the Philippines—indeed, he was strengthened in it by the results which were reported by Secretary Root—but division upon past issues or future issues should not cause division among the American people upon recommendations which offered an opportunity to awaken among the Filipinos the respect and affection which all Americans desired. Dr. Felix Adler, who followed Mr. Shepard, had for his subject "Coolie Labor," and urged with great power the close kinship between coolie labor and the slave labor which was its immediate predecessor in the West Indies, and for which it is being urged as a substitute in the East Indies. In the West Indies, he said, the coolies, deprived of freedom by their contracts, were often treated with greater cruelty than the slaves whose exhaustion meant loss to their owners, and in one little island the entire four thousand coolies imported perished in a few years from the revolting hardships to which they were subjected or from suicide, to which a large part of their number were driven. When laborers are held to service by fear of arrest and punishment, they are not free men, and the American people, who a generation ago at fearful cost suppressed

slavery in this country, should not re-create it in any form in the Philippines.

❀

Future Issues in the Philippines

President Schurman, of Cornell, the last speaker, took for his subject "American Ideals," and in his speech dealt rather with the issues of the future than the needs of the present. He said:

There is not, I believe, a single man of them who will consent that his country should be permanently a dependency or colony of the United States. Thousands have died and hundreds of thousands are still ready to die in the cause of Philippine independence. Our war with the Filipinos has made a nation of them; they are no longer Tagalogs or Visayans or Ilocanos, but one people with a single national consciousness and a single national heart. By force the Filipinos may be worried and harassed; but force will not mitigate or destroy their unconquerable love of independence. But men ask, in incredulity, Shall we give up the Philippines? The Philippines belong to the Filipinos; we hold the islands as guardians and trustees pending the political pupilage of the Filipinos; when they set up for themselves, they will resume title to their property; and it is our duty at the earliest possible moment to grant them their independence. And shall the flag, once raised, come down again? Two years ago I saw it wave all over Cuba. But it has come down in that island—to the joy of the Cubans and the everlasting honor and glory of the United States. The American flag has always stood for liberty and national independence, and to aid the Filipinos in achieving liberty and national independence is its thrice-glorious mission in the archipelago.

President Schurman declared that the question of Philippine independence, when orderly government is established, had never yet been passed upon by the American people. Three weeks ago he had put the question to a great audience of workingmen in New York, and only four had stood for the creed that the flag must not be hauled down. A fortnight before he had put the same question to more than two thousand school-teachers in Nebraska, and only eight had stood for the doctrine that the people of the Philippines should be denied the government of their choice. He concluded his address by urging that government by force was only to be justified as a temporary measure, and that a government resting upon loyalty was the only government which could or should endure. In our judgment, it will be time enough to meet the future issues when they arise, and it is a mistake to turn public attention away from pressing and immediate obligations to future and theoretical problems. The duty of to-day is to give the Filipinos industrial relief along the lines indicated by Mr. Shepard, and to guard sedulously against any danger of slave labor or any approximation to it. When this relief has been afforded, starvation has been warded off, the Filipinos have been put upon their feet, the census has been taken, the national consciousness which Dr. Schurman rather foresees than sees has been perfected, and a legislature has been elected to give expression to it, the Filipinos will be in condition to know what they want and we shall be in better condition both to understand them and to meet their wants. We do not now think that they will then wish for absolute and formal independence; but we are very certain that the American people will not wish to hold them in unwilling subjection.

❀

A New Method of Defrauding the City

District Attorney Jerome last week exposed an entirely new method by which the Tax Department of New York City has been defrauded. He put under arrest the Librarian of the City Library and three associates who are charged with supplying "dummies" to impersonate wealthy business men and swear off their personal taxes. The conspirators were entrapped by getting them to engage as one of their dummies a county detective, whose age and size fitted him to impersonate for them one M. B. Bryant, in order to, in his name, swear off the latter's personal assessment from $80,000 to $10,000. The detective was carefully coached by the conspirators as to the answers he should make to the questions asked him in the Tax Department. According to the charges, the system employed by the gang under arrest included a card catalogue of all New Yorkers assessed for personal taxes and several classes of dummies, who could be sent to impersonate tall and stout men, tall and thin men, short men, stout and thin, men with whiskers and men without —actors out of work being often employed to fill the rôles assigned. The wealthy taxpayers or tax-dodgers were not, as a rule, it is thought, told that some one

else would swear off their taxes for them for a consideration, but merely assured that a reduction in their assessments would be secured if they paid the price asked for the service—perhaps a percentage of the amount saved them by the reduction. Nevertheless, the business men who were duped into believing that these assessments were reduced by legitimate means were probably not unwilling to be duped, and the incident brings home once more the laxity of the current commercial conscience regarding the defrauding of the public. The tax-dodgers in question were unwilling to commit perjury, for by perjury most of the personal assessments in New York may be evaded. Yet they were willing to employ shady characters to aid them by hidden means in withholding from the city a part of their legal dues. The two remedies for this state of affairs are, first, a change in the law so that property shall be taxed only where it is invested; and, second, a change in public sentiment by which attempts to reduce just assessments, whether of personalty or realty, shall be branded as attempts to cheat the whole community. It is one of the anomalies of our time that the robbing of individuals should be regarded as so much more disgraceful than the robbing of the city, the State, and the Nation to which the allegiance of every citizen is due.

❀

Chicago's City Ownership Bill

Upon the surface of things Chicago's City Council is now as unanimous in support of city ownership of street railway lines as it was in opposition to this measure a decade ago. By a vote of 51 to 16 it has asked the Legislature to pass a bill allowing any city of the State to purchase street-car lines at any time by condemnation proceedings, and the opposition to the bill recommended seemed to come chiefly from the supporters of a measure making the popular control of the whole situation still more complete. The bill sent to the Legislature with the Council's support—the Jackson Bill—provides that the bonds issued for the purchase of the street railways must be "made payable solely out of the revenue of such street railways," and "shall in no event be or become general obligations or liabilities of the city." It is only, therefore, when, in the eyes of the investing public, city ownership of street railways bids fair to be as profitable as city ownership of waterworks that the undertaking can be entered upon. It is further required that the ordinance providing for city purchase shall specify the price to be paid and receive the assent of sixty per cent. of the voters when submitted to the citizens for their approval. Neither of these stipulations is obnoxious to the trusted leaders of the municipal ownership movement, for these men do not wish their cities—any more than they would wish their firms—to engage in a business undertaking unless there is the prospect of business success and pretty general agreement among their associates that the undertaking should be begun. The popular fear that the Council's action does not mean as great a victory for municipal ownership as it would seem to upon its surface is based upon the opposition of a majority of the Council to the supplementary measures urged by Mayor Harrison—particularly the stipulation that no franchise should be leased to a private company for more than five years without the approval of a majority of the voters, if ten per cent. of their number petition for the submission of the lease to popular vote within sixty days after it is sanctioned by the Council. Inasmuch as city ownership of street railways in Chicago is almost necessarily postponed by the fact that not all of the present franchises expire at the same time, the possibility of further aldermanic extensions of particular franchises for long periods without popular approval involves a real peril to the principle of city ownership. Alderman Jackson's claim that no Alderman "would dare to vote contrary to the wish of the people" does not carry conviction among those familiar with franchise grabs. In the judgment of The Outlook, the amendment providing for a referendum of all considerable extensions of a railway franchise should be urged on the Legislature by the citizens of Chicago.

❀

Primary Reform in Baltimore

After years of agitation, Baltimore, Md., has at last a thoroughly good primary election system. It will receive its first practical trial at the city el

this spring, and some defects may be developed by the trial; but the general plan of the law, as outlined for us by Mr. George Stewart Brown, of the Baltimore bar, is so admirable that we do not fear any general dissatisfaction with the result. The principal features of the law are as follows:

First, the primaries of both parties are held on the same day and in the same voting booths.

Second, the ballot used is prepared by public officials, contains the names of all candidates alphabetically arranged, and is voted in secret.

Third, every citizen has a right to vote in the primaries of the party with which he prefers to be affiliated, the law expressly providing "that the statement of such party affiliation does not bind him to vote for the candidates of such party at any given election."

These provisions do away with the abuses by which conscientious citizens are kept from voting in the primaries of either party and corrupt ones are permitted to vote in the primaries of both. The "floaters," as they are called, upon whom the machines of both parties count to do them service in the primary elections, have still one vote, but they have no longer two or more, as the primaries of both parties are held together under the same safeguards as a regular election; and the citizen who is unwilling to do the machine's bidding can no longer be kept away from the primaries by a requirement that he must pledge himself to vote for all its nominees, however obnoxious to his moral sense. Besides these provisions, the new Baltimore law has another introducing the principle of direct primaries for the most important officer to be chosen at any election. If delegates to conventions are chosen, the name of the candidate they are pledged to support is printed above each list of delegates. Thus in a general city election the voter can be sure what man he is voting for as Mayor, and only need intrust to the delegates the selection of the minor officials on the general ticket. The councilmanic candidates will be voted for directly in the various wards. The new law gives to the party machines the right to adopt in full the principle of direct primaries; and Western experience indicates that voters are likely in time to demand that they shall have the privilege of saying who their party's nominees shall be for all offices.

English Political Reaction

The passage of the Education Bill in its modified form has settled the matter for the moment, but it is very evident that, while advancing the interests of education on the one hand by securing unity of control, and probably greater uniformity of teaching, it has introduced a principle which so offends the English sense of justice that the bill contains in itself the germ of vigorous reaction. Liberal feeling about the measure is well expressed by an English Liberal correspondent of The Outlook of unusual intelligence in these words: "Lord Rosebery used unusually strong language in describing the political reaction in England when he received the deputation from the Free Churches which waited on him on the eve of the second reading of the Education Act in the House of Lords. 'If the country is prepared to submit to the principle enunciated in this bill,' he then said, 'you may give yourselves up to an interminable reign of the principles associated with Lords Eldon and Sidmouth. You may hope for an era of great military and naval and diplomatic supremacy abroad, but you have very little to hope for in the development of free institutions at home. You cannot limit the effect of a bill so far-reaching in its principle, or want of principle, as this. If it is to be established as a maxim that the Church of England is to have the education in the schools entirely maintained by public funds and entirely controlled by a close corporation constituted under the trust deeds of these schools—if that is to be established, and established without demur and protest, we may look forward to a great political deterioration throughout the nation at large.' Strong as this language is, it must be conceded that it is no overstatement of the case. It is necessary to go back to the dark days in nineteenth-century history, when Great Britain was so long at war with France, to find a precedent for a Parliamentary enactment which embodies more of the Bourbon Toryism of Eldon and Sidmouth than the Education Act which has just become law. Any time between 1832 and 1886 such a measure would have brought England to the verge of revolution. To-day it is acquiesced in, for really little can be hoped from the

movement among Free Churchmen to make the bill unworkable by refusing to pay the taxes levied by the local bodies intrusted with the administration of the new Act. As a matter of fact, the Education Act is only one of many signs of the extraordinary reaction which has been at work since 1886. More is being made of the Crown to-day than at any period since the era of personal government; and the Tory landed aristocracy, including the House of Lords, now count for more in political life than at any time since the reign of George III. They monopolize more of the Cabinet and Ministerial offices than they have done for half a century past; and they seem able to assert their right to all these prizes as easily as they did when nearly half the members of the House of Commons were nominated by peers and larger landowners. As yet there is only one indication that a change is even in sight. The trade-unionists all over the country are quietly but very systematically preparing to return more labor members at the next general election. It is from the working classes that a turn in the tide is to be expected. The United States, however, is not unlikely to have an indirect part in checking the reaction. American industrial supremacy will in the next ten years bring new and serious problems for England; and as these will be bread-and-butter problems, the middle and working classes will at no distant day be compelled to join forces again, and assert themselves against the aristocracy as they did between the end of the French wars and the Reform Act of 1867."

❀

The Political Position in Japan

The session of the Japanese Parliament now in progress promises to be one of the most interesting since the opening of the diet twelve years ago. The "two burning questions" to be discussed are the Government's plan for the expansion of the navy and the continuation of the land tax at its present rate for that purpose. The scheme for naval expansion contemplates the annual expenditure of about eleven and a half million yen—the approximate amount of revenue realized from the increase in the rate of the land tax—during the next ten years. The rate of the land tax was raised in 1898 for a period of five years only, from 2.5 per cent. on a low valuation to 3.3 per cent. for the purpose of carrying out the Government's undertakings following the China-Japan War. Unless further legislation is passed, therefore, the former rate will be restored at the end of next year, with a consequent diminution of the national income of the amount above mentioned. The *Seiyukwai*, or Constitutionalists, presided over by the veteran statesman Marquis Ito, control an overwhelming majority in the lower house of the Parliament. The members of the General Committee and the local branches of the party throughout the country, representing largely the agrarian interests, have announced themselves as opposed to the Government's policy of naval expansion based upon the continuance of the present rate of the land tax. A similar position is taken by the political rivals of the Constitutionalists, the *Shimpoto*, or Progressives, headed by Count Okuma. The upper house, on the other hand, is thoroughly conservative and inclined to oppose any policy that is dictated by party interests. They may thus, as a whole, be expected to oppose the Constitutionalists as a party, and Marquis Ito because of his relation to that party; and to support the Government in case the latter is assailed in the lower house on party lines. The present Cabinet, which has shown itself to be a very able working Cabinet, avowedly holds a neutral position in respect to political parties, being neither openly allied nor opposed to any of them. At the same time its leanings, if any can be discerned, are in the direction of the conservative peers rather than of the liberal commoners.

❀

Questions at Issue

As to the questions at issue, there is a pretty general consensus of opinion that the navy must be augmented if Japan is to hold her own in Far Eastern affairs. Even with the proposed increase, the country will at the end of the period have dropped to a relatively lower place among the naval powers of the world than she now occupies. The crucial question, therefore, is whether or not the cost of the necessary expansion shall be met by the continuation

of the present rate of the land tax—no other adequate source of revenue being easily discernible. The underlying question as to the ability of the people to bear longer the burden of the increased land rate is a complex one, with much to be said on both sides. At the same time it appears to be true that while the national wealth has during the last twenty years increased three or four fold, and while the farmer gets twice as much for his rice as previously, the amount of taxes has increased during the same period only about one-half. The center of interest in the situation at last reports was Marquis Ito. Although the President of the Constitutional party, he has not as yet declared his position as to the Government's policy, and there is reason to think that his party constituents may have publicly recorded their opposition to the Government's programme without his formal sanction. It is believed that his broad statesmanship must lead him to see the vital necessity of the proposed naval increase, and it is remembered that only four years ago he faced the Parliament in support of this same issue of an increased land rate. His whole public career has been that of a peacemaker. Will he be able now to find any middle ground on which the Cabinet and the upper and lower houses can unite? If so, it must be a policy stamped with patriotic devotion to the national welfare rather than to personal or party interests. It may well be, however, that the veteran statesman will feel convinced that, at the present stage of constitutional government in Japan, the road to true national welfare lies along the path of fidelity to party interests; in which case a dissolution of the Parliament may follow and an appeal to the country; or the reins of government may be voluntarily surrendered by the present Cabinet to the Marquis and his followers.

❀

A Japanese Leader in the Arts of Peace

Count T. Sano, father of the Red Cross Society in Japan, who died in Tokio on the 7th of December, in his eighty-first year, was one of those extraordinary products of new Japan that brighten the hopes of the world. With the usual education of the feudal gentry plus a knowledge of Dutch medicine, he saw grand opportunities when Perry made treaties in Yedo Bay and Verbeck taught in Nagasaki. Sent in 1862 by the Shogun to Holland to learn ship-building, he visited also the Paris Exposition, and there was as much impressed by the apparatus for saving life as he was with the machines for maiming and killing. At home again, he was active in "giving light and saving life" by helping to perfect the new lighthouse system. When, in 1873, the Vienna Exposition opened, Sano was the man of the hour; for in him love of art was a passion, while experience in the Occident showed him just what to collect and send. At the Austrian capital artistic Japan gave a revelation to Europe that made an epoch. While in Austria he learned thoroughly the workings of the Red Cross Society. When the bloody Satsuma rebellion of 1877 broke out, which cost Japan twenty thousand lives, Sano, with the Emperor's permission, organized the Society of Mercy. This was the beginning of the Red Cross, which now numbers over a half million members, and has resources and equipment on land and water that might shame some Western nations. Sano loved bronze images of Buddha and Quannon (goddess of mercy) as works of art; but for actual exhibition of mercy he preferred surgeons, nurses, and clean hospitals. He was the founder and chief patron of the Fine Arts Society, and the recent notable revival of outdoor statuary and natural decoration in Japan owes much of its force and value to him. He was president of both societies during many years. Foreign Envoy, Minister of Finance, Privy Counselor, decorated by many sovereigns, Sano led in the victories of peace and humanity.

❀

Tenement Reform in Peril

The tenement-house reform victory in the New York Legislature two years ago is in danger of being succeeded by a humiliating defeat. Governor Odell in his message called for an amendment of the present law, and, emboldened by this message, the builders of tenements, with whom a high rate of profit is the only consideration, have introduced a bill embodying a long series of most brazen demands. In the first place, they would change the definition of the term "tene-

ment-house" so that it shall include only buildings containing more than four families, instead of buildings containing more than two families. There are now a vast number of four-family tenement-houses and the possibility of vast numbers more, and all of these buildings the proposed law would relieve from the requirements of the tenement-house act as to fireproofing and sanitary requirements of every sort. Even the new law making it perilous to conduct houses of prostitution in tenements would no longer be applicable to buildings of less than five stories. Besides the wholesale changes made by this new definition, the proposed act allows 75 per cent. instead of 70 per cent. of the lot to be built upon, allows water-closets to be erected in the "free" space, permits rooms with no windows into courts or light rooms, simply stipulates that men must be able to "see" in the inside rooms, instead of being able to "read" there, allows the public halls in the tenements to be entirely unlighted after ten o'clock, permits the renting of cellars for homes without the authorization of the Tenement Department, and in general permits in tenement-houses the lowest standard of living which sordidness on the part of either landlords or tenants would suggest. In the name of the civilization of the State as well as the health and morality of the immigrant poor, who must accept the conditions offered them, these proposed amendments should be voted down. Tenement-house construction was not blocked by the present law. On the contrary, as Commissioner De Forest reported the other day, hundreds of old tenement-houses were remodeled to conform with it, and five hundred new tenement-houses built with not a single dark room in any of them. The tenement-house owners who have obeyed the law should be protected against the competition of those who would evade its provisions. Only the worst classes of landlords or tenants demand the proposed amendments.

Church Federation and Practical Co-operation

Conditions of life in the tenement districts of the city and means for the improvement of them formed the subject of the meetings held last week by the Federation of Churches and Christian Organizations in New York City. That the churches of the city are not indifferent to the attack on tenement-house reform, mentioned in the preceding paragraph, was shown by the interest in Commissioner De Forest's address from which we have quoted. Plans for relief from congestion in these districts by means of removal to suburban regions, the establishment of substitutes for the saloon, effort for improvement in treatment of criminals in city courts, and the regulation of immigration, were some of the projects which were presented as offering opportunities of co-operative action by the churches. These meetings, interesting as they were for the very human and real character of the addresses made, have their chief significance in their indication of the direction from which church unity is coming. No creed, no ritual, no polity, was common to all the churches represented, but simply a desire to make the Christian ideal a reality in individual and social life. Effort to emphasize agreements in forms of belief, in forms of worship, and in forms of organization, rather than disagreements, is certainly discernible among churches of to-day; but effort to unite in practical measures of making the life of humanity Christian is even more pronounced, is certainly more inclusive, and is most likely to promote that real unity without which there is little advantage in a unity that is formal.

Railway Disasters

The absolute dependence of the safety and lives of railway passengers upon sureness of eye and brain in railway employees was strikingly illustrated by two terrible disasters last week—one on the Central Railroad of New Jersey, just beyond Westfield, the other on the Southern Pacific, not far from Tucson, Arizona. In each collision a score of lives were lost, and in each case the direct cause was the criminal carelessness of a railway employee; in Arizona a station agent neglected to deliver orders to an engineer, with the result that two trains met going at speed in opposite directions; in New Jersey the engineer of a fast express passed several cautionary signals and one peremptory signal, and paid the penalty of his mistake with his life when his engine crashed

into the rear of another train which had been stopped by a hot box. It is not enough, however, when we read the pitiful and heartrending accounts of the suffering that followed the collision, to say that human error is inevitable; we may properly ask whether this very element of fallibility has been guarded against up to the possible limit. In the Westfield collision, for instance, the railroad has an excellent block system, the signals were properly set, an extra precaution had been taken by telegraphing a special stop order, which either was not signaled or was not noticed by the engineer—probably the latter; in short, the engineer, Davis, was plainly and flagrantly to blame. Yet the circumstances show that, with all the rules observed, the margin of safety for fast expresses on that road is a very slender one. The engineer was alone in the cab, the fireman ten feet away from the cab, and not where he could communicate with the engineer; the latter suddenly found the injector out of order, turned to fix it, and in two minutes the engine, rushing on at a speed of perhaps seventy miles an hour, had covered more than two miles, passed several signals, and was close upon the preceding train. Ought not there to be a law to require more than one man to be in the cab of an express train? An attack of illness, an accident, any one of a dozen causes, may at any moment incapacitate an engineer; and in the new type of locomotive in use on the Central of New Jersey the fireman is most of the time where he can be of no assistance. Again, it is asserted that Davis declared before his death that it was the general custom of engineers to run past the green cautionary signal and up to the red stop signal without slacking speed, in the belief that the stop signal would change by the time it was reached; that he relied on the track being kept clear for the express, as was usually done; and that no fast express could make time if the engineer obeyed the rules strictly. All these things may be false, but the public has a right to know how closely railway companies are enforcing their own rules; to know if it is true that an engineer is impelled to risk his own life and those of his passengers in order to make time, and that he can take such a risk without being punished (to pass a red block-signal light knowingly is a penal offense), whereas a failure to make time injures him. If these things are so, then any block system that can be devised is worthless, and the wonder is, not that calamities take place, but that so few are recorded. There should be a constant inspection of the actual working of railroads by State officials acting for the public safety and with power to prosecute individual offenders.

❀

The International Institute for Girls in Spain

The Outlook wishes to call attention to the notable work which has been accomplished for Spanish girls and women by Mr. and Mrs. Gulick, whose thirty years' residence in Spain has gained for them the confidence of all classes. The American corporation controlling the work, having as President Dr. S. B. Capen, of Boston, and as Treasurer Mr. E. H. Baker, of Greenwich, Conn., has now bought an acre and a half of land in the finest part of Madrid, upon which buildings are to be erected. An appeal is being made for funds, and the cause should receive a support in this country rivaling that given by England in supporting Lord Kitchener's project for Gordon College in the Sudan. The late Mrs. Alice Freeman Palmer, who had intimate knowledge of the American Institute, declared that it should be moved to Madrid as soon as possible, for only there could its influence be most widely felt throughout Spain. It has been located at San Sebastian. The Institute first prepared students to be teachers in primary and secondary schools; and more than forty of its graduates have been employed as teachers in the principal cities of Spain. While Spanish law allows both girls and boys to enter all national institutions, few girls had made use of this privilege up to 1890. In that year Mr. and Mrs. Gulick decided to present students for the examinations of the State Institute, thus bringing them into line with the State system of education. Fourteen girls presented themselves and successfully passed the examinations, some even receiving the mark of "Sobre Saliente," the highest mark given. The next year forty-one girls were examined, and thirty-three came up to the same high standard. In 1893, at the Chicago Fair,

the exhibit of the International Institute gained a diploma and medal. In 1894, for the first time in the history of Spain, girls taught by women received the degree of Bachelor of Arts—a class of four from the International Institute. The B.A. degree entitles a student in Spain to enter a university without further examination; and in 1895 two of the students matriculated in the University of Madrid, and in 1897 were graduated with the highest rank. Only the most favorable reports come from the graduates scattered over Spain. Three thousand children are now under their instruction, and the Institute is recognized everywhere as filling a need in the educational world; indeed, each year more teachers are asked for than can be supplied and more pupils apply for entrance than can be accommodated. It would seem that the time has come to establish a Protestant college along American lines in Spain. This ideal should appeal to those of our countrymen—and there are many—who believe that America's duty to Spain did not end with the Spanish-American war.

❀

The Fight for Honesty

The "Fight for a City," of which Mr. Hodder tells our readers, and "Holding Up a State," of which George Kennan tells them, are both parts of that great battle between righteousness and wrong, truth and falsehood, purity and corruption, justice and tyranny, which constitute the true history of the world from the earliest ages, and will continue to constitute history until what Dr. Mulford has well called "The Republic of God" is established on the earth.

Mr. Jerome, in his first public speech before a mixed audience, as reported by Mr. Hodder in The Outlook for January 24, 1903 (page 204), well said: "Issues mean that there is something upon which honest men may honestly differ. I have never known any one to take issue on the Commandment, Thou shalt not steal." That is true; and yet it is also true that there was no other issue in Minneapolis when the Grand Jury of Minneapolis presented to the people of that city the question whether their Mayor should be allowed to remain in the Mayor's chair; no other issue in St. Louis when Mr. Folk began his proceedings against the St. Louis boodlers; no other in New York when Mr. Jerome began the indictment proceedings before the public of the Tammany blackmailers; and there is no other issue now pending in the State of Delaware. The question, Shall we have common honesty in public officials? takes precedence of all other questions. It is to-day the most important question before the American people, and will continue to be until it is so decided by the people that no corruptionist will venture again to raise it.

❀

Mr. Hobson's Position

To the Editors of The Outlook:

In two recent issues of The Outlook reference has been made to a singularly erroneous report of a lecture given by me under the title "The Charity of Millionaires," which procured too wide a publication for me to be able to correct it.

In that report an offensive paragraph relating to Mr. Carnegie and Mr. Rockefeller was given, not one word of which I uttered in my lecture. Nor did I argue anywhere that trustees ought to trace money offered to its sources, and refuse it if those sources were found to be tainted. I am disposed to regard such action as impracticable. The real point of my argument, entirely missed by commentators, lay in my insistence that the growing reliance upon private charity tends to sap the energy of public self-help, "pauperizing" cities and States, and preventing them from putting forth the wholesome effort of providing and supporting essentially public services out of the public funds. JOHN A. HOBSON.

January 31, 1903.

We give as prominent a place to this correction as we gave to the original report. It apparently leaves Professor Bascom alone in his contention that trustees of benevolent institutions are to sit in judgment on the moral character of the transactions by which the money has been made which is offered to them for public uses. Mr. Hobson's contention is of a very different character, and deserves certainly careful and candid consideration. Our own response to the question which he raises follows. It may, we think, be said generally that democracy is slow to initiate great enterprises of any description, educational, philanthropic, or commercial; but it is often able to carry them on energetically after they have been initiated. Congress would not appropriate fifty millions of dollars to get an entrance into New York City for an inter-

State railway, as the Pennsylvania Railroad is ready to do; but it is quite possible that a National Commission might operate it after it was built. Neither Nation, State, county, nor town would have started the libraries to which Mr. Carnegie has given life; but now that he has given them life, States, counties, and towns will be very apt to follow the example which he has set. It is doubtful whether up to this time the State, the city, or the school district would have engrafted the kindergarten on the public school system if private enterprise had not started free kindergartens and so demonstrated their value. Privately endowed universities had to exist for many years before democracy was ready to tax itself to establish them. Now they are numerous, efficient, increasing, and well sustained. The great mass of mankind walk by sight, not by faith; therefore some one more prophetic than the mass must give them the vision of a profitable investment in actual operation before they will invest in it. It is doubtful whether it is ever wise for private wealth to do for a community what it is willing to do for itself; but in so far as private wealth devotes its energies to initiating new forms of public service which democracy has not thought of, or would not believe in until their value had been demonstrated, it will not pauperize the community; rather it will stimulate the public to larger enterprises by showing their practicability and their value.

❀

Arrogance in the Senate

Last week, in commenting on the scandalous Senatorial elections in Delaware and Colorado and the highly unsatisfactory election of Mr. Platt in New York State, we said that these things were developing and strengthening the tendency of public opinion in favor of popular elections of United States Senators. An article in the "Century Magazine" for February, by Mr. Henry Loomis Nelson, in a very readable and graphic way points out the growth in the Senate of a belief in its own superiority to the President, the House, and the people—a belief which would be amusing if it were not pernicious. Mr. Nelson enforces his conclusions by anecdotes and stories, some of which recall one that used to be told of James Russell Lowell when he was Minister to the Court of St. James's. It is reported that great pressure was brought to bear upon Mr. Lowell to present at Court the wife of a certain United States Senator, who had every qualification of personality and character to exclude her from Court, and whose only ground for her demand was that she was a "Senatorial lady." Mr. Lowell resisted as long as he could, but finally such political pressure was brought to bear upon him that he was about to yield, when one day, in the anteroom of the embassy, he overheard this "Senatorial lady" exclaim in a high-pitched voice, "When I seen that dressmaker's bill, I just laid back and yelled." Unconsciously in this way the "Senatorial lady" strengthened Mr. Lowell's determination, and she was never presented.

This incident has no important political significance, but it does illustrate the arrogance with which some Senators, with nothing but the power of a political machine and of newly acquired wealth behind them, attempt to dictate what shall be the standards of law, morality, intelligence, and good taste throughout the country. Unfortunately, this spirit of arrogant assumption is not confined to such Senators. Even so highly cultivated a man as Senator Hoar has recently given expression to the autocratic views which the Senate sometimes seems to entertain respecting its own dignity and authority. He has assumed on the floor of the Senate to rebuke the President for venturing to intimate to certain Senators opinions which the President entertains on questions of public policy, and the hopes which he shares with the great body of the Republican party respecting certain policies, which for their adoption and execution require the co-operation of the Senate. Nor is it alone the President whom Senator Hoar would forbid from expressing opinions on public questions to members of the Senate for the purpose of influencing their action. A few years ago he administered on the floor of the Senate a similar rebuke to the people of the United States for venturing to address letters to Senators expressing judgment on public issues and urging upon them certain specified Senatorial action. Why

should the senior Senator from Massachusetts endeavor thus to draw, Wotan-like, a cordon of divine fire around the sleeping Senate, to keep its slumbers undisturbed by profane hands, now of the people, now of the President? The President is not a mere high-salaried page to run the errands to which the Senators call him, to fetch and carry when they clap their hands; nor are the people of the United States subjects of an empire ruled over by a council of Doges. In the Senate are many men of great ability and of fine personal fiber, men who have rendered eminent service to the Nation by their counsels, and among them history will award a distinguished place to Senator Hoar. But they are the servants, not the masters, of the people, and the wisest and best of them are, at least they always ought to be, glad to welcome expressions of opinion respecting the National judgment and the National will from every source.

The arrogating to itself of unquestioned authority, the resentment of counsel and criticism, which are sometimes witnessed in the Senate, grow partly out of the frailty of human nature, but more especially out of the unregulated and irresponsible power which our present method of electing Senators by legislative action tends to confer upon them. Popular elections, and the sense of personal responsibility to the people which they would involve, would act as a very healthful check upon this tendency in the Senate to become arrogant—a tendency which is not peculiarly characteristic of the United States Senator, but is apparently natural in the average man who reaches a position of great power. Modifications of our system of government must be made with caution and deliberation. They must be brought about by a process of evolution, not of revolution. But sufficient time has elapsed since the establishment of our system of Federal Government, and sufficient practical knowledge has been secured of the good effects of popular elections, to warrant a persistent demand on the part of the people for popular Senatorial elections. The demand will have to be enforced by a vigorous and intelligent public opinion, since the Senate, for membership in which so many wealthy individuals have paid such large initiation fees, will not abandon the very comfortable and superpopular position which it has so painstakingly won, without an earnest struggle to retain it.

Mr. Hay's Diplomacy

The signing of two treaties within a week at the American Department of State calls renewed attention to the activity and efficiency which has distinguished the Department under its present head.

In 1898 the American Ambassador to England relinquished his duties there, having, in the words of one of the greatest English statesmen of our day, accomplished twice as much during two years as had any other American envoy during a longer tenure of office. Colonel John Hay left London to accept promotion to the Secretaryship of State. The American-Spanish War had just come to an end. Our relations with England were scarcely closer than they are now with Germany. Despite Manila, our title to position as a world power was not yet conceded in Europe. In China, for instance, we played a part far below England's. The settlement of various and complicated issues after the war constituted a difficult task for our State Department; but the settlement was made with credit.

In 1899 occurred the outbreak of the Boer War. To the world one principal result of that war was secured by the American State Department in persuading England to accept a general declaration that foodstuffs, though in transit to an enemy's ports, were not contraband of war unless there were evidence that the food was intended for the enemy's military use. Up to this time, as it had suited her convenience, England had ranged herself on both sides of the question. Not only were American rights upheld by this decision, but in the future the weakest country, though at war with England herself, the greatest sea power, may invoke justice by this guarantee of good faith.

In the beginning of 1900 our State Department won for the world that which England had long been trying to obtain from Russia, France, and Germany—the open door in China. Henceforth, whether territorial integrity be preserved or not, it

is agreed among the Powers trading with China that Chinese ports shall remain open on equal terms to the commerce of all nations. The joint agreement of the Powers, obtained at our instance, is justly regarded by the American Government as having all the solemnity of a treaty.

Later in 1900 occurred the Boxer Rebellion in China. If it had not been for American intervention, the chief result to the world of that rebellion would have been the partitioning of the Flowery Kingdom among the Powers. As an American Secretary of State had insured Chinese commercial integrity, so now he sought to preserve territorial integrity, despite sneers from every chancellery in Europe; the Chinese Government was treated by us, during the entire period of Boxer atrocities and the following siege of Peking, as a real government. The encouraging result, not only to China, but to all civilization, was apparent as soon as the smoke of battle had cleared away. Our task was by no means accomplished, however. During the international discussion which followed, it was necessary for us to protest against and to put an end to the secret agreements which Russia was trying to impose upon a prostrate people. Following this, in disapproval of the Allies' outrageous punitive expeditions, the State Department advised the Administration to withdraw from China all United States troops, with the exception of the Legation guard. So little did supposedly intelligent European authorities understand this that the London "Spectator" actually described our course as "timid and vacillating," and the "Journal de Genève" mourned "the loss to America of her influence in the concert of the Powers." Next, though opposed by all the Allies who were urging a policy of unwarranted delay, the American Department of State secured the evacuation of China on the terms of the original protocol. Finally, there remains to the Department the hard task of inducing tolerant treatment in the matter of the Chinese indemnity.

The Department's other notable recent efforts have been in the advancement of the cause of international arbitration, first at the Hague Congress and then before the Hague Tribunal; the ratification of the Hay-Pauncefote Treaty, supplanting the outworn and outgrown Clayton-Bulwer Treaty; the representation to the Rumanian Government concerning its treatment of the Jews; the negotiation of reciprocity treaties with Cuba and Newfoundland and the Panama Canal treaty with Colombia; finally, the Hay-Herbert Treaty looking towards the settlement of the Alaskan question, the last of the great points of divergence between America and England.

At the dinner of the Ohio Society in New York City the other evening, one of the speakers declared that Mr. Hay's name would stand in history alongside Webster's and Clay's, in view of services rendered to the legitimate enhancement of American power by an American Secretary of State. The steadiness with which our present Secretary has adhered to an unselfish policy, the candor, frankness, straightforwardness, above all, the scrupulous "squareness," of his methods, are in welcome contrast to the selfishness, secrecy, indirection, delay, and, wherever possible, the harshness of other methods. If America has become a world power, it is largely because of the success of the new American diplomacy, representing not so much material as ideal aims and ends. Humanity in general is freer and finer because such diplomacy exists.

❀

The President and the South

It seems to be the nature of all moral movements to create a current in the opposite direction, and it ought not, therefore, to appear surprising that the strong movement in the South toward the education and elevation of the African race should be accompanied by a passionate protest against anything which looks toward either a recognition of the gains the negroes have already made or toward a still further enlargement of their opportunities. Nor is it out of the common that this race prejudice should disregard the plain facts of current history, for none are so blind as those who do not wish to see. Certain it is that the notion that President Roosevelt has been forcing the race issue upon the South is in curious contradiction to the actual facts. Probably no man ever went into the Presidential chair with a more sincere desire to promote harmony between the North and the South

as well as between the races, and at the same time to do something really to help the blacks through rewarding those who by their lives had won the confidence of the whites, and who possessed high individual character. At the beginning of his administration the President disregarded in a measure the claims of his own party in Alabama, and appointed Judge Thomas G. Jones, a Gold Democrat of the very highest standing, to a Federal judgeship. Later he overthrew a political faction in Mississippi and appointed men of good record to office—in two cases white Democrats. Still later he recognized what was known as the sugar-planter element of Southern white Republicans in Louisiana, and thereby indirectly destroyed a disreputable faction. These are but examples of what has been done in several States, largely with the view of putting good men in office, who could command the confidence of the Southern whites. The President has refused to take the wholly untenable position that no man, however excellent his character and whatever his fitness may be, can hold Federal office if he has any African blood in his veins; but then no President since the Civil War has taken such a position. He has, however, in fact, actually nominated but one negro to office in a place or State where no negro was holding office before. On the other hand, he has probably placed more negroes in office in the Northern States than any former Republican President. In some cases in the South he has reappointed negro men of high character whom he found in office; in some cases he has displaced colored men in order to fill the place with men of better character; in some cases he has made a shift of offices—has appointed a negro to an office formerly held by a white man, and *vice versa*, as in appointing Mr. A. B. Kennedy Receiver of Public Moneys at New Orleans, and making a white man Naval Officer of the Port, a place held by negroes under every former Republican administration since General Grant's time; in another case he relieved a negro of a Southern position and took him out of the South altogether, giving him an office in the District of Columbia—reference is made to Mr. John C. Dancy, who was Collector of Customs of the Port of Wilmington, N. C., under the McKinley administration. In still another instance a negro postmaster was not reappointed, but a white man was placed in his stead—this was at Athens, Georgia.

In most of these cases the changes were made with the purpose of placing a negro of higher capabilities in office, or, when no principle was at stake, to meet, if possible, the wishes of Southern whites. The net result is that at the present time there are fewer negroes, by two, holding Presidential offices in the South than there were under President McKinley. Mr. Roosevelt has nominated for office but one negro in the South where no negro was holding office before—namely, Dr. Crum, recently appointed Collector of Customs at Charleston, S. C. The President has been most careful to seek information from Booker T. Washington and many others as to the individual character of negro candidates, and as to their standing in the Southern communities where they live. Early in his administration, before there was any thought of a vacancy in the Charleston Collectorship, the name of Dr. Crum was brought to his attention as that of a man who had the respect and confidence of both races in the South, and especially in Charleston. When the vacancy in the Charleston Collectorship occurred, the President naturally thought of Dr. Crum in connection with it, since he had placed no negro in office in South Carolina. He had no reason to suppose that there would be more opposition to Dr. Crum than was shown against Mr. Deveaux, the negro Collector at Savannah appointed by Mr. McKinley to a position paying four times the salary of the Charleston place. In refusing to recognize the "lily-white" movement in the South, which sought to keep out of party councils the few colored men who had been declared fit to exercise the franchise even by Democratic election boards, the President could not have acted otherwise than as he did, without disregarding the principles upon which the Republican party was founded and going further in disregarding the rights of the negroes than the Democrats had done.

We think ourselves warranted in saying that the President believes that the negro should give himself to the work of securing education, property, and the cultivation of high character, and that it has

been and is far from the President's intention to do anything that would unduly excite the political ambition of the black man; but he also believes that the recognition of some of the worthy colored men of the country is wise and proper, and tends to encourage others to make themselves worthy and deserving of recognition. We believe that the best men in the South agree with the President in this conviction now, and more of them will agree with him as time goes on.

❀

Professor Ritschl on Religious Teaching

Under the title "What Service do academic Teachers of Theology render to the Church?" Professor Otto Ritschl, of the University of Bonn, utters himself in the "Christliche Welt" for December 11, 1902, concerning a certain resolution passed by the Brandenburg Synod of the Lutheran Church. The resolution expresses regret that so great a chasm exists between the scientific point of view to-day and the "sound doctrine of Holy Scripture and of the Reformation." This lack of adjustment is declared to be a source of great harm to students. The supreme authorities in the Church are urgently requested "in the selection of instructors to seek especially for such men as will, by a correct and sane use of the evangelical freedom of science, do justice to the demands of the Church." Members of theological faculties are urged to give attention "not merely to the scientific equipment of students, but also to the formation of their Christian character."

Professor Ritschl agrees that character-building should be a prime end of theological instruction. But he asks: "What, pray, shall we do to attain this end? Shall we preach to our students for their spiritual edification? It is true that religious inspiration does result from the hours spent in the lecture-room. But such inspiration is not the immediate end sought by the instructor. The professor's desk is not a pulpit. The lecture-room is not a church. The professor is not a preacher. His audience is not assembled for worship. What he offers is rather a sober, clear, unprejudiced scientific criticism. As he himself in his own free investigation has learned to see things, so he desires to teach his students to see clearly what is sacred, noble, exalted, potent, to discriminate between the kernel of truth and the husk which has gathered around it in the course of centuries."

"But what has this to do with the formation of character? I ask in reply: Is the ability to apprehend the truth a slight thing? Nay, do not ministers above all need to have their sensitiveness to truth developed, educated, strengthened? And how can this sensitiveness to truth be better secured than through unhampered scientific research, which aims to teach men to use their own eyes, to form their own convictions, and then, in the majesty of self-reliant character, to act the part of men in their later practical life?"

In conclusion, Professor Ritschl turns the tables of criticism against those who feel themselves to be guardians of the faith against scientific misuse. "Why is it," he asks, "that a constantly diminishing minority of educated men go to church? What is the cause of this breach between the thinking and feelings of the mass of people and the conventional ecclesiastical view of things? Why so widespread a depreciation of what the church offers? May we not demand of you clergymen—especially of you who boast orthodox piety—that you shall honestly ask yourselves what vital relation there is between the outward message which you proclaim with rhetorical fervor in sermon and ritual, and the capacity of your heart to create genuine religious enthusiasm? Beware how you try to reproduce the great words and emotions of spiritual heroes, and to be lavish with borrowed riches, unless you have the inward right to stand on the heights of religious experience which they reached. Stand on your own spiritual level, not on that of another. A knave always gives out more than he possesses. Beware of even the suspicion of desiring to give out more than is rightfully yours to give. Then will cease all this flippant talk about priests and priestcraft which rightly distresses you, but at which you have no right to be indignant. And, above all, beware of pietistic pathos, of clerical unction, of priestly phrase. For these are the symptoms by which men know that your inner life does not reinforce the

impression which you fain would make with outward speech."

We have given large space to these extracts from Professor Ritschl's article because he appears to us to indicate two very important principles: one the secret of religious power in the teacher, the other the secret of religious power in the preacher.

I. It is often said that our public schools are godless schools because religion is not taught in them. But this is to confound religion and theology. Theology is not taught in them, but it does not follow that the spirit of religion cannot be imparted in them. The recent hot debate in England concerning the new educational bill, which puts the school system largely in the control of the Church of England, had its support in a general impression that schools could not be religious unless catechetical instruction in theology was imparted in them, and, as the Church of England is the Established Church, it was natural that the catechetical instruction in theology should be turned over to the rectors and the curates, and therefore the general charge of the schools should be committed to them. But this again is to confound religion and theology, and to suppose that religion can be imparted only by instructing pupils in theology. But, in fact, in this country the distinction between the secular and the religious, of which so much was made half a century ago, is already passing into deserved oblivion; the notion that the schools are purely secular institutions like a bank or a factory is already antiquated, though, like other antiquated notions, it lingers late in certain quarters; and we are, by a measurably unconscious process, learning to make our public schools religious without making them theological. And this we are doing, not by studying religion as though it were a department by itself, but by conducting all our studies in a religious spirit. Doubtless there is room for further improvement; but doubtless progress will be found by pursuing the direction in which improvement has already been made.

Thus, Herbert Spencer's oft-quoted saying, "Amid all the mysteries by which we are surrounded, nothing is more certain than that we are ever in the presence of an Infinite and Eternal Energy from which all things proceed," indicates the spirit in which scientific studies are increasingly pursued. It is only the superficial scholar who imagines that he is studying phenomena if he is simply gathering them together and putting them in appropriate pigeonholes. True scientific study includes an investigation into the relation of phenomena and their ultimate cause, and so into their intellectual and moral significance. True scientific study presupposes nothing, but, without presupposition, it ever seeks the cause behind the effects, the Infinite and Eternal Energy behind all its various manifestations. It is not only the undevout astronomer who is mad; every undevout scientist is, if not mad, certainly shallow. There is doubtless an irreverent and flippant agnosticism which not only affirms its ignorance of all that lies back of phenomena, but rejoices in its ignorance; but this is rarely found coupled with scientific attainment. It is the agnosticism of Robert Ingersoll, not of Spencer or Tyndall or Huxley. The teaching of science by the truly scientific teacher, the teacher who is a profound thinker as well as a keen observer, does not need to supplement his scientific teaching with a theological catechism. His teaching will itself promote the spirit of awe and reverence.

So, again, Matthew Arnold's oft-quoted saying, "There is a power not ourselves that makes for righteousness," is a necessary deduction from the study of history. For history is not a mere meaningless collocation of events and dates, which happen to succeed each other in one order but might as well have succeeded each other in some different order; so that, so far as the teacher can see, the Puritan revolution in England might have preceded the Norman conquest, or in America the abolition of slavery might have antedated the American Revolution. There is a moral order in history; each cycle prepares for the following cycle, each series of events for the series which follows. There is a development of the race as of the individual, and history is a study of this development. It is possible to learn dates and events and know nothing of history when all are learned, for this is not studying history. Studying history is tracing the orderly development of humanity toward an ever higher and

better life; it is the recognition in the successive stages of what the scientists call evolution and the theologians call redemption. The teacher of history, whatever his creed, if he has any vision, any insight, any power to perceive the movement of the river as well as the bubbles and the sticks upon the surface, if he is anything more than a mere dry-as-dust encyclopædia of nearly useless information, cannot teach history without doing something to inspire in the pupils a forward look, a hopeful anticipation, and a purpose more or less clearly defined to have a share in that onward progress of the race which history makes clear to him. It is not necessary to supplement the study of history with a catechism to make it religious.

Still again, Literature is the expression of human life. Taine says that as behind the forest the student sees an animal, so behind the document he sees a man. It is this seeing of the man behind the document, this seeing of life expressed in the writing, that constitutes the study of literature. The student of the great world literatures learns not only the different dialects in which human life has expressed itself, he also discerns the unity of humanity beneath all these dialects, in all these literatures. By his study of Homer and Job and Dante and Victor Hugo and Shakespeare and Hawthorne, he learns that in Greek and Hebrew and Italian and Frenchman and Englishman and American, in ancient life and mediæval life and modern life, there is a real unity; that ambition and revenge and remorse and skepticism, that heroism and faith, and hope and love, are common to men of all races and all ages. He cannot really study literature without imbibing in the process a broader and more catholic spirit of humanity. Such a study will do much more to promote in him a recognition of human brotherhood than learning and reciting an answer to a catechetical question about the first man, as the progenitor of the whole human race.

It is not by adding a catechism to our curriculum, it is by pursuing all studies in a profoundly thoughtful spirit, the spirit that looks beneath the mere surface to the truth and life beneath, that education is to be made truly religious. This principle American educators slowly, and the American people still more slowly, are learning; and as they learn it our public-school education, as well as that of our higher institutions of learning, is becoming more religious without becoming more theological.

II. To what Professor Ritschl has said in the quotation given above respecting the secret of power in the preacher we need add but little. We repeat it only to indorse it. The preacher ought to speak with authority, as Christ spake with authority. But Christ's authority was not ecclesiastical. He had no Church behind him as his sponsor. He was not a Rabbi; he had received no theological education; the Rabbis would have none of him; "How knoweth this fellow letters," they scornfully cried, "having never learned?" They turned him out of the synagogue. The fields, the private house, the seashore, became his meeting-house. But wherever he met his congregations he spake with authority, because he had in himself the consciousness of the divine life and truth, and power to awaken the consciousness of divine life and truth in his auditors. This was the secret of his power. This was the secret of Paul's power: "We know, therefore have we spoken." If a minister has this power, the more natural, simple, genuine, human he is, the greater will be his power. The holy tone, the ministerial manner, the dogmatic assumption, not only will not in our day serve as a substitute for this spiritual authority, they will impair what little spiritual authority he may possess. The scientific spirit, of which the dogmatists and traditionalists are afraid, is this very spirit which puts truth as supreme and is ready and glad to welcome it whatever it may be, whatever it may supplant, and whithersoever it may lead. So far from threatening religion, this is the only spirit which will conserve it, because it is the very essence of true religion itself.

We sum all up in a single sentence. Religion is a spirit of life: catechisms are not the only conduit through which it can be imparted; if the teacher possesses it, he will impart it through his instruction; if a minister does not possess it, he cannot impart it; if he does possess it, the more simple and unaffected his expression of it the greater his effectiveness.

HOLDING UP A STATE

THE TRUE STORY OF ADDICKS AND DELAWARE

BY GEORGE KENNAN

I.

LAST fall, just before the biennial election of members of the Delaware Legislature, the wife of a locally well-known farmer in the southern part of Sussex County said to her husband at the breakfast-table, "Jim, how much are you going to get for your vote?"

"I don't know that I'm going to sell my vote," replied the husband.

"I can't see," she said, "why you talk like that; why shouldn't you sell it? We need the money bad enough. Other people sell theirs, and I don't see that they're thought any the worse of. You're not the first man that's done it. Look at the men who have taken Addicks's money, and see where some of them are now!"

About a week later, on election day, a German citizen of Camden, Kent County, went into the cashier's office of the Addicks Republican party in that village, presented to the cashier a small button of a peculiar form, and shortly afterward came out, bringing in his hand seventy-five dollars in crisp, new bills of the Merchants' National Bank of Boston, which he had just received for his own vote and the votes of his two sons. Holding up the money as he passed an acquaintance on the street, he said, significantly, "It would take a good many drops of sweat to make that seventy-five dollars!"

On the same day, in Milford, Kent County, a young man who had always before voted the straight Democratic ticket went into the voter's assistant booth of the Addicks Republicans. When one of his friends, William T. Morris, who happened to be the Democratic voter's assistant, looked at him reproachfully, as if to say, "I didn't think you'd go back on your party in this way," the young man replied, with a shamefaced smile, "I know you don't like to see me going in here, Will, but they've got the most money."

Six weeks later, while engaged in an investigation of the political situation in Delaware, I happened to be driving one afternoon along the sandy country road that leads from Millsboro, Sussex County, to Dagsboro. My driver, an uneducated but fairly intelligent young fellow of eighteen or twenty, seemed to be quite ready to talk to a man whom he supposed to be a commercial traveler, and I had no difficulty in getting at his views with regard to the political situation and the election.

"How did it go in your town?" I inquired; "the Union Republicans won, didn't they?"

"Oh, yes!" he replied; "the Addicks men bought up pretty much everything there was in sight. I've heard that they paid some fellows as high as thirty dollars."

"Is the selling of votes a regular thing down here?" I asked.

"Pretty regular," he said, nonchalantly; "they 'most all do it; and it ain't such a bad thing for the county, neither. There's a lot of money come in here since Addicks took a hand, and it's been a great help to the farmers."

"What do the people generally think of Addicks?"

"Well, I dunno; I guess they think he's all right—anyhow the Unions do; but from the talk I hear 'round the hotel I judge they don't really want to have him elected Senator. They'd rather keep him along on the ragged edge, because, they say, 'When he's elected, where's our money comin' from? He won't give down any more.' *I* think, though, he ought to have it. I'm a Democrat myself, but when a man spends his money like he does, I'm damned if I don't think he's entitled to it."

Such are the views and the practice of the people of southern Delaware with reference to one of the most important duties of American citizenship. The cases that I have cited are few in num-

ber, and may seem inadequate as a basis for a sweeping charge of political corruption; but they are typical as well as characteristic, and fairly illustrate the state of demoralization to which thousands of the Delaware people have come. Women urge their husbands to sell their votes because they need the money and because the act is no longer regarded as disgraceful; eight-year-old boys wish that they were grown up, so that they might get twenty dollars from Addicks; fathers sell not only their own votes but the votes of their sons who have just come of age; Democrats go into the camp of the Addicks Republicans simply because the latter have "got the most money;" and intelligent young men frankly express the opinion that the bringing in and distribution of a huge corruption fund is a good thing for the poor farmers, and that a man who buys votes enough to elect him to the Senate of the United States is fully entitled to go there, and is unjustly treated, if not actually defrauded, when kept out of the position for which he has liberally paid.

What influences have brought about the moral deterioration shown in such opinions and practices as these, and what party or person is chiefly responsible for the corruption of a population that was once honest and of good repute? It is my purpose, in this and the following articles, to answer these questions by giving the results of a study that I have recently made of Delaware politics and the working methods of certain Delaware politicians. I have no prepossession for or against any political party as such, and it is a matter of perfect indifference to me whether the Senators from Delaware be Republicans or Democrats. I have looked at the situation, therefore, in its political aspect, with absolute impartiality, and I shall try to present accurately and fairly the facts that have come to my knowledge. The only personal bias of which I am conscious is a strong inherited prejudice in favor of common honesty.

The history of political corruption in Delaware is, for the most part, the history of a single man and a single party. Other men have bought votes now and then upon a small scale, and other parties have resorted, occasionally, to tricky or dishonorable methods; but no systematic attempt was ever made to corrupt the whole population and buy up the whole State until J. Edward Addicks and the Union Republican party took the field. With a lone star for their device, and "Addicks or nobody" for their war-cry, they began a campaign of corruption which has had no parallel, I think, in the political history of the United States.

When, after the most lavish use of money, they failed to attain their ends, they proceeded to hold up the State, as a highwayman would hold up a stage; and declared that it should go unrepresented in the United States Senate until it would agree to elect Mr. Addicks to one of the vacant seats. This hold-up still continues, and seems likely to continue until the winter of 1904–5, when Mr. Addicks's lieutenants promise to end the long struggle by "wiping up the earth" with all the honest Regulars and incorruptible Democrats who may then be left. In view of the wide and general attention that the legislative deadlock in Delaware is now attracting, I shall postpone, for the present, a review of Mr. Addicks's earlier career, and devote this article (1) to a characteristic illustration of his latest working methods, and (2) to a description of the means by which he brought about, last November, the election of the Union Republican legislators who are now supporting him at Dover.

First, the attempt to make a "deal."

In the early part of last September, Dr. L. H. Ball, the present Congressman from Delaware, who happened then to be in Wilmington, was called to the telephone by an acquaintance named Lawton, who asked him if he would not go to New York that night and meet a few gentlemen who were desirous of settling the factional fight in Delaware by means of an amicable arrangement. Dr. Ball got the impression, from Lawton's telephone talk, that the New York gentlemen referred to were members of the National Republican Committee. He consented to go, met Mr. Lawton at the station, and they started. On the train Lawton virtually admitted that he had secured Dr. Ball's consent to go to New York by means of an innocent stratagem; and that the person whom they were really to meet was J. Edward Addicks. When they reached their destination, they drove to the New York Yacht Club, where Addicks had his

J. EDWARD ADDICKS

headquarters, and were there received by Addicks himself, Caleb R. Layton, his Secretary of State, and J. Frank Allee, President of the Bay State Gas Company. After the exchange of conventional greetings, Mr. Layton opened the conference by making a speech, in which he referred to the great service that Mr. Addicks had rendered to the Republican party in Delaware; denounced the injustice with which he had been treated by the Regulars; and declared that even if, for the sake of harmony, Addicks should withdraw from the contest, the people of Kent and Sussex Counties would continue to support him, and would vote for him indefinitely, as a matter of honor and principle.

Dr. Ball, who was irritated by Layton's speech, as well as by the means adopted to secure his own presence at the meeting, rose to his feet and said that he had come to New York upon the representation that a conference was to be held for the purpose of putting an end to the Delaware contest. As it was perfectly evident, from Mr. Layton's remarks, that nothing could be accomplished in that direction, he did not care to waste time in further talk, and would therefore bid them good-day. As he was about to leave the room, Addicks threw one arm around him, in a half-familiar, half-affectionate way, and said, "Oh, Ball, sit down, and let's talk this thing over." Mr. Addicks then proceeded to discuss, in the most amicable manner, the political situation in Delaware, and finally said: "The fact is, Ball, you ought to go to the Senate. We haven't got a thing against you

except that you have persisted in fighting us, and if you would only join us, and use your influence with the Regulars who are opposing us, it would make your political future secure. I think you ought to go to the United States Senate with me."

Dr. Ball replied that he did not care, at that time, to discuss the question of his political future, and that so far as the Regular Republican legislators were concerned, he could not influence them in favor of Mr. Addicks, even if he felt disposed to do so; because they were voting against him on principle.

Mr. Addicks then said: "I'll tell you what I'll do, Ball; there are three men in your party that I want to get. If you'll use your influence with Chandler, Pilling, and Flinn,[1] and get them, I'll have the Governor call a special session of the Legislature, and I pledge you my word that you shall go to the United States Senate with me. If you use your influence with those men in good faith, and, for any reason, fail to get them, I will still promise that you shall be renominated for Congress, as Representative, on both Republican tickets, and sent back to Washington for another term."

Dr. Ball replied that he could not control the three men named; that he would not if he could; and that he must decline to enter into any deal or agreement with Mr. Addicks that would involve the political future of either.

Addicks then became irritated in turn, and said, with emphasis: "You won't? All right! I'm going to reiterate now what I said years ago: I'm either going to be Senator, or I'll sink the Republican party in Delaware ten thousand fathoms deep!"[2]

"A man who talks in that way," rejoined Ball, hotly, "is no Republican! Such speeches, and action in accordance with such speeches, have kept you out of the United States Senate thus far, and will keep you out always." He then took his hat, left the room, and returned that night to Wilmington.

By the terms of the compromise agreement between the Union Republicans and the Regulars, made in 1900, Dr. Ball was equitably entitled to re-election as the Congressional representative from the Delaware district; but when he refused to make the deal suggested by Addicks, the latter determined to punish him for his obstinacy, and therefore put up United States District Attorney Byrne to defeat him. The result of Byrne's nomination on the Union Republican ticket was the election of a Democratic Congressman; but, as one of Mr. Addicks's lieutenants afterward said to me, "We intended to beat Ball, whatever happened; we preferred a Democrat to him." Byrne resigned the office of United States District Attorney and thus became the instrument of Addicks's vengeance, and when he had been defeated by the Democratic candidate, he was reappointed to his old place. It is not improbable that Byrne really expected to be elected; but whether he did or not, Addicks seems to have used him as a means of punishing a man against whom, as he admitted, he had nothing personally, but with whom he had failed to make a corrupt deal.

I have cited this case as a characteristic illustration of one of the many and varied methods by which Mr. Addicks endeavors to secure the help or support of men to whom he dares not offer cash. He knew that he could not buy Dr. Ball, but he thought he might tempt him with the United States Senatorship. He held the temptation in one hand and a club in the other, and when he failed to entrap he smote.

Among all the varied inducements held out by Addicks and his lieutenants to men whom they wish to "get," spot cash takes the first place; and in the election, last fall, of the legislators who are now voting for Mr. Addicks in Dover, it played a more important part, perhaps, than all other inducements combined. Before attempting to describe, however, the ways in which money was made to take the place of argument and persuasion in that campaign, I must give the Addicks workers the benefit of the explanations that they make for publication with regard to this charge of vote-buying and corruption. Such explanations may be summed up, briefly but fairly, in the reply to a question that I asked the President of an Addicks Republican club in Sussex County. He had just called my attention to the overwhelming majorities rolled up by the

[1] Representatives William Chandler, of White Clay Creek hundred, Richard T. Pilling, of Mill Creek hundred, and William R. Flinn, of Christiana hundred.

[2] Mr. Addicks first made this declaration in a telegram to Senator Washburn, of Minnesota, shortly after the adjournment of the Delaware Legislature in May, 1895.

Union Republican candidates in the southern part of the State, and had referred to this apparent unanimity of public sentiment as a proof of Mr. Addicks's great and growing popularity. "Yes," I replied, "it does seem to show that Mr. Addicks gets hold of the people in some way; but the general understanding is that he obtains these big majorities by means of wholesale vote-buying. What about that?"

The Addicks man laid his hand on my knee; bent forward a little; looked at me for a moment with a grieved and shocked expression, and then said, with slow enunciation and impressive gravity, "Now, Mr. Kennan, this is confidential—that's what it is—confidential—between me and you and God!——It ain't so!"

The reply made by Mr. Layton, the present Secretary of State, to a similar inquiry was not so brief, and was not "confidential between me and you and God;" but it was to the same effect—"it ain't so!"

"The rural population of Kent and Sussex Counties," said Dr. Layton to me, "comes from the sturdy, self-reliant Anglo-Saxon stock. They are not ignorant, low-born foreigners—in fact, the foreign element is very small—and I doubt whether anywhere in the United States there is a population of better ancestry. They are generally industrious farmers, who do their own thinking and live by their own efforts, and the idea that such a population, with such an ancestry, is purchasable—that it can be bought up wholesale by anybody—is incredible—it is inconceivable! If the Republicans of Kent and Sussex Counties are corrupt and purchasable, there is no Republican party in the State, and no material out of which a Republican party can be made. It's true we don't play Sunday-school politics in Delaware, because we have to fight the combined corruption fund of the Democrats and the so-called Regular Republicans; and we're in the position of a man who is up against a Texan desperado armed with a six-shooter. We did put up Byrne to beat Dr. Ball, because Ball refused to recognize us and didn't secure a single appointment of any consequence from the ranks of the Union Republican party. There are less than two hundred Regulars in this county, and yet they hold all the Federal offices. The Regular Republicans have been trying to browbeat us and tyrannize over us ever since 1896; but they can't beat us. As for the Legislature, not a single member of it from these lower counties has ever been pledged to Addicks. We don't have to get pledges from our legislators—they vote for Addicks without any pledge, simply because such is the wish of ninety-nine out of every hundred of their constituents."

It is not necessary at present to comment upon Dr. Layton's assertions further than to say, first, that more than fifty per cent. of the Republican voters in Kent and Sussex Counties are "Anglo-Saxons" from the coast of Africa, whose incorruptibility is not wholly beyond question; and, second, that the statements with regard to vote-buying which he furnishes to newspaper men seem to differ widely from the admissions made by him to personal friends and associates in private conversation. In 1894 the Sussex County Republican Committee was authorized to expend $2,000 of Mr. Addicks's money in an election precinct that contained only 280 voters; and two years ago Dr. Layton told a prominent lawyer in Georgetown that up to that time Mr. Addicks, to his certain knowledge, had spent $400,000 in Delaware in campaign years alone.

Second, setting aside, for the present, the questions raised by Dr. Layton's conflicting statements, I shall try to describe what happened in the legislative campaign of 1902—that is, last fall; and I will begin with the notes of the Merchants' National Bank of Boston.

Two or three days before the November election, Mr. Addicks, or somebody acting in his interest, brought into the State of Delaware two whole series (fives and tens) of crisp, new, consecutively numbered notes of the Merchants' National Bank of Boston, and distributed them among the Union Republican workers in all the election districts of Kent and Sussex Counties. Prior to the first of November there was not a single new, unworn bill of that bank in all southern Delaware; but five days later the two lower counties were flooded with them. On the day after election, Mr. C. W. Lord, a well-known hardware merchant of Dover, took in over the counter, in the ordinary course of business, twenty-eight of these

bills, all of the denomination of five dollars, and before the end of the week the First National Bank of Dover was holding nearly five thousand dollars in this particular kind of currency, all crisp, new five or ten dollar notes that had never been creased, or that had been folded only once. Although the numbers of these notes were scattering, they were so distributed as to show that two whole series had been used, and that the notes whose numbers were missing in one shop or one bank had merely been spent or deposited in another. More than a month after the election, I myself obtained in Dover a lot of ten-dollar notes of this bank, whose numbers ran from 33,414 to 34,691, showing the use of $12,770; and through the hands of a single business man in Milford there passed notes whose highest and lowest numbers indicated the distribution, on election day, of more than $20,000. A gentleman in whose sources of information I have perfect confidence informed me that not less than $30,000 in crisp, new bills of the Merchants' National Bank of Boston went into the banks of Kent County alone, immediately after the November election. An equal if not a greater amount was undoubtedly distributed in Sussex County, and thousands of dollars passed from hand to hand without getting into banks of deposit at all. If the cashier of the Merchants' National could be compelled to disclose the name signed to the check or checks upon which these new, consecutively numbered notes were issued, the Attorney-General of Delaware would be fully justified, I think, in filing an information under Section 8, Article V., of the Delaware Constitution, and bringing somebody before the Superior Court of Newcastle County for trial on the charge of vote-buying and bribery. Such a course of procedure would purify the political atmosphere of the State, and it might result in the enforced retirement of Mr. Addicks from the field of Delaware politics. I will not undertake to say where he would go, but he certainly would not go to the United States Senate.

That these notes of the Merchants' National Bank of Boston were paid into the stores and banks of Kent County by Union Republican voters there is not the shadow of a doubt. In Dover, in Camden, in Georgetown, in Dagsboro, in Bridgeville, and in many other towns and villages of southern Delaware, the pay offices of the Addicks cashiers were perfectly well known, and scores of men were seen going to them from the polls and coming out of them with the new, crisp bills in their hands. In Camden, Kent County, for example, the cashier's office was a small empty building familiar to everybody in the community. One hundred and thirty negroes, who had voted the Union Republican ticket, went from the polls to that building on election day, and some of them as they returned dropped into stores, with the money in their hands, and, holding it out for inspection, said to the clerks, "Say, boss, is dis yere counterfeit?" The crispness and newness of the unworn and uncreased notes excited their suspicion, and led them to fear that the bills had been manufactured for election purposes only.

In Georgetown, Sussex County, the office of the Addicks cashier was in a well-known general store on the main street of the town. The business of paying for Union Republican votes was carried on there so openly as to become a public scandal. Justice Boyce, of the Delaware Supreme Court, happened to pass the place on election day; saw negroes coming out with money in their hands; and was so filled with indignation that he went to the office of ex-Attorney-General Richards and asked whether the thing could not be stopped. Mr. Richards said that he thought Judge Boyce would be fully justified in raiding the place personally. The Judge thereupon went back to this store, burst in on the Addicks men, and said indignantly, "Gentlemen, this is disgraceful! It's scandalous! You'd better stop it!" The cashier's office was then moved to the house of a negro in a comparatively remote part of the town.

The buying of votes throughout southern Delaware, in last fall's election, was so open and so notorious that the local Addicks men did not think it worth while to make a secret of it, and the figures that I am about to quote were, in most cases, given by them to personal friends or intimate associates among the Democrats and Regulars. In the Camden precinct of the Seventh Representative District of Kent County, the chief Addicks

worker, whose name I have, bought more than 200 voters, including 130 negroes out of the 134 who were registered. The market price of votes in the morning was $15, but it advanced to $25 later in the day. Five thousand dollars were sent there hurriedly in the afternoon, as a special emergency fund with which to buy votes for J. Frank Allee, the Addicks candidate for State Senator in the Third Senatorial District, when it was found that he was running behind in Dover. The emergency fund saved him, but he had only 98 plurality. In the first precinct of the Ninth Representative District of Kent County 175 Union Republican votes were paid for out of 225, and in the Fifth Representative District of the same county the Addicks workers bought 89 votes at $30 apiece, and about 100 votes (of negroes) at $10 apiece.

In the second precinct of the Second Representative District of Sussex County (Northwest Fork hundred) the Addicks men spent between $9,000 and $10,000, and bought 307 of their 401 votes. In the northern part of Nanticoke hundred, Sussex County, they polled 158 votes, of which 140 votes were purchased. In the First Representative District of Sussex County (Cedar Creek hundred) they bought more than half their voters, including 258 negroes out of 260. In the Dagsboro hundred, Sussex County, all of the Union Republican votes were bought except 16. There are said to be less than 50 unpurchasable voters in the whole Dagsboro hundred. In the Fifth Representative District of Sussex County (Little Creek hundred) the Addicks workers spent $5,700 and bought 407 votes. In the Fourth Representative District of the same county they spent $4,500 and bought 240 votes, as shown by their list.

I might continue this enumeration of votes bought in southern Delaware if there were any necessity for so doing; but statistics make monotonous reading, and I have given specific cases enough, I think, to sustain and justify my general charge. A prominent Union Republican leader told a citizen of Wilmington, who is well known in Washington as well as throughout Delaware, that Mr. Addicks spent in Kent and Sussex Counties in the campaign of 1902 no less than $130,000. This included, I presume, the cost of maintaining and running his political "machine." Scores of Addicks workers have to be paid every year for their services; the "influence" of locally prominent men has to be bought—frequently at a high price—and large sums of money given to local managers for the purchase of votes are misappropriated or embezzled. In 1894, for example, Mr. Addicks, or an agent acting in his behalf, put into the hands of two workers in Gumboro, Sussex County, the sum of $2,000 to be used in buying votes. The workers stole most of the money, and the election district went Democratic by 56 majority, although the corruption fund of the Democrats was only $275. It is a common practice, furthermore, among Addicks workers to buy negro votes at the rate of $5 or $10 apiece, turn them in to Addicks at the rate of $15 or $20 apiece, and then pocket the difference between the real price paid and the listed price. Against fraud of this kind Mr. Addicks, of course, has no protection. There may be "honor among thieves;" but honor does not seem to be a characteristic of men who are hired to buy votes in Delaware; and although the employer may know that he is being robbed, he cannot prosecute the robber without admitting that he himself is *particeps criminis*. Dr. Layton told a friend in Dover, two years ago, that among the Addicks workers in Sussex County there was nobody whom he could trust with money. They all stole.

Making due allowance for cash misappropriated or embezzled, and for the expense of running the Delaware "machine," Mr. Addicks probably spent not less than $80,000 in Kent and Sussex Counties last fall in the corruption of the electorate, and bought seven or eight thousand of the thirteen thousand votes polled for his legislative candidates. He now has twenty-one supporters in the Delaware Assembly, and is holding up the State as usual. Senator Hanna, Chairman of the National Republican Committee, telegraphs State Representative Flinn at Dover that the anti-Addicks men ought not to combine with the Democrats to defeat the Union Republicans, because "certainly the party is entitled to the fruits of its" (purchased) "victory."

[TO BE CONTINUED]

A FIGHT FOR THE CITY

THE STORY OF A CAMPAIGN OF AMATEURS

BY ALFRED HODDER

Private Secretary to District Attorney Jerome

IV.—The Powers that Rule

IT is not the office of the leader of a great campaign, in his speeches, or even, it may be, in his inmost meditations, to do elaborate justice to the mood and mind of those he comes to overthrow; it is enough for him if in his words and thoughts he does rough justice to their deeds. Not their inward and spiritual state is for the moment of importance to him and to his hearers, but the state of the community beneath their rule; in the nice consideration of degrees of innocence or guilt there would be for him and for his hearers only loss of passion and of power. To the defense the Tammany politicians might have made Mr. Jerome paid, naturally enough, small heed; yet in the long interval for unimpassioned thought that lies between election and election, the nature and the weight of that defense may well be found of moment, not to the defendant only, but to the community itself.

There was nothing new in Mr. Jerome's clear recognition of the alliance between the grafter and the puritan. Every man about town experienced in men and affairs takes that alliance for granted in his daily speech. What has escaped notice, seemingly, is the significance of that alliance for the conscience of Tammany itself.

The practice of levying blackmail on the wicked for the profit of the righteous is at least as old as Robin Hood; the practice of making vice contributory to the public treasury prevails in many foreign lands to-day. It is not a system that in the United States is sanctioned by the public conscience and the public will; but it is a system, not a chaos; it is to the credit of the administrative instinct in the community at large that, in the absence of administrable laws, there should have been evolved so firm and definite a scheme. An inadministrable law is in practice not a law; it commits to the administrator the labor of evolving case by case a practicable scheme. An inadministrable law is in practice infinitely worse than none; it foreordains the illegality of every practicable scheme. Where the law is inadministrable, the administration of the law is necessarily illegal; where the law is inadministrable, the administrator of the law is the legislator's *âme damnée*. The price paid for the specious virtue of the legislator is the administrator's legal guilt. It is not to be wondered at that the administrator should upon occasion turn in wrath upon the eloquent accuser who has been the foreordainer of his crime. The Tammany politician has thus turned upon his accuser more than once; he has declared in good set terms that he has served the public as in fact though not in word the public wishes to be served. The guilt of perjury lies in deceit. The oath he takes and breaks, the public has required that he shall take—and break; and it is toward the public only, he may reasonably claim, that its obligation was incurred. It is a familiar principle of law and ethics that to the performance of impossibilities no man can possibly be bound. The legislating public solemnly propounds to him an oath for the performance of impossibilities which it knows to be impossibilities; he solemnly recites the oath that its propounder knows to be an oath for the performance of impossibilities: *qui est-ce qu'on trompe ici?*

The administrative system thus evolved is far from being the private property of Tammany or even of the Democratic

party as a whole. No political party in the United States has the monopoly of the administrative lie. The system is essentially the same whatever party may chance to have the upper hand. If it is under Tammany that the illegal administrative system is oftenest and most violently denounced, that is by no means because under Tammany the administrative lie and the illegal administrative system it necessitates reach their extremest form. It is rather because the Democratic party as a whole, and Tammany in particular, have less than their opponents' genius for the administrative lie. It is rather because the Tammany politician is administering a system to which he was not born. The administrative lie is Anglo-Saxon, Protestant, and Puritanic; the Tammany politician, as a rule, is none of these three things. His taste in lies, if lie he must, is of a different kind; his taste in men is of a different kind; his very conscience is of a different kind. Confessedly it is not the Anglo-Saxon element that is predominant in Tammany; and no one ever yet has called hypocrisy the Irishman's besetting sin. His temptations to departure from veracity have seemingly an altogether different source. They are temptations seemingly to overpraise his interlocutor rather than his own people or himself, and the praise he gives and seeks is not the praise of being grave and good and great; it is the praise of being loyal, loving, charming, witty, brave, and kind. It is probable, indeed, that he sees neither stimulus to virtue nor evidence of virtue in the overstatement of his own or of his neighbor's moral strength; he has been taught that the remission of men's sins must be preceded by the confession of their sins, and that none have been more ready to claim kinship with the sinner than the holiest of the saints. His forte lies neither in rebuke nor exhortation, nor even in moral indignation. It can scarcely be affirmed of him as yet that he has shown any special aptitude for doing justice; it can scarcely be denied of him that he loves mercy and walks humbly with his God.

Far from overstating his own virtues, he is prone upon occasion to understate them—of all modes of speech the most bewildering and exasperating to the average Anglo-Saxon mind. Only the other day Mr. Croker was guilty of a slip of just this sort; in words which rang from the Atlantic coast to the Pacific, he declared himself to have been working for his own pocket all the time. No man in the least experienced in men or in affairs will find it credible that in this instance he was speaking the truth about himself. It is not to be believed that ever any man attained and kept the central place in a vast body of quick-witted and hot-hearted men by working for his own pocket all the time; it is not to be believed that Mr. Croker has not sacrificed a thousand times his personal and present interests, if not indeed to those of the great public, still to those of his colleagues and his clan. The point is that, face to face with enemies who had a gift and passion for good words, he had no impulse to give himself good words; he had an impulse rather of sheer wrathful and disgustful impatience of good words; he utterly declined to drape himself in any decorative phrase. The point is that this impatience of the decorative phrase is found far oftener on the Democratic than on the Republican side. There is nothing in the principles of the two parties to explain their difference on this point; the principles of the Democratic party lend themselves perhaps more readily to the requirements of the ringing phrase: the source of the difference lies rather in a difference of race and of inherited ideals. It is only in the Democratic ranks that there occur such outbursts of impolitic and disconcerting candor as made memorable the administration of the late Chief of Police; it would be an error to suppose that William Devery incurred the indignation of the public in the first instance by his deeds; he incurred it by his words. There had been chiefs of police before his day who exercised quite as capriciously and ruthlessly as great an arbitrary power; what the public would not stand for was a lawless exercise of power that was not even denied. That William Devery did himself injustice by his words there is no reason to believe; but at least it is self-evident that he, too, had no impulse to give himself good words; he has a gift for words, but he has used it for the fabrication of the undecorative phrase. Audacities of utterance like his can never be the rule in any group of politicians; and Mr.

Croker, and for that matter Mr. Sullivan, are more renowned for silence than for speech; but still their very silence obviously is a silence from good words. They may plead plausibly enough that they have done what the great public wishes to have done, but in the meanwhile they have failed to say what it wishes to have said. They have too lightly taken for granted that by keeping on the statute-book the formulas of the administrative lie, the public craving for the decorative phrase is once for all appeased. Among their colleagues few or none have made amends for this oversight of theirs. Even when the Tammany politician is in theory a convert to the charm or to the usefulness of the administrative lie, even when he takes it on his lips deliberately, he, for the most part, fails to recite it with sufficient gravity and unction; because it is a formula, he recites it *du bout des lèvres* and formally; like certain Old World comedians lauded by Charles Lamb, he seems to be confiding to his audience that he is but playing a part. When the administrative lie is called in question, he has not the least appearance of feeling his own veracity to be impugned; it might be almost fancied that he breathed more freely, as now at last at liberty without deceit to speak the lines set down. If we are near waking when we dream, we are still more obviously near truth-telling when we are willing to admit we lie; indeed, fiction owned for fiction has seldom, except among the strictest of the puritans, passed for a lie at all. But lies so told lose half their power to thrill; under the administration of Tammany the great Anglo-Saxon public has been left starving for good words.

In the United States the public is by no means Anglo-Saxon—witness Tammany; and the time may come when even in morals there will be a compromise between the ideals of the Anglo-Saxon race and those of races whose blood is blent with ours. To me it seems that in the compromise there is not necessarily involved a moral loss. There is something to be said for the morality of suiting action to word and word to action, and something even for the morality of being a little better than one's word. I cannot for my life detest William Devery—he is too veracious; nor yet Tim Sullivan—he is too kindly; there is in the world no sort of charity that counts for good except Big Tim's. Nor yet Tammany itself; it fosters in too great perfection the spirit without which no great republic ever yet has thriven—the spirit of the clan. The clan differs from the trust, whether of capital or labor, in that it embraces all sorts and conditions of men. There are doubtless various excellent sorts of men that count few representatives in Tammany, but at least it has been rather they that held aloof than Tammany that refused to take them in. Tammany has enabled men in widely different states of life to understand one another's needs and natures. It has accomplished quietly and effectually for its own innumerable members what has been too often fussily and ineffectually attempted for the community at large. It has supplied in time of need material aid without the intervention of a Charity Organization, and legal aid without the intervention of a Legal Aid Society. If its system of administration has been liable to terrible abuses, it has been sedulous in the protection of the individual against the working of the system, at least whenever the individual has been a member of the clan. No doubt it has been often reckless of the interest of individuals not numbered with the clan; no doubt it has often been reckless of the interest of the public as a whole. But it was said long since by a great statesman that the man who in his politics pursues the interest of his friends at least has proved himself disposed to seek some other interest than his own. And it may be doubted whether any man was ever capable of working to good purpose for the public who was not capable of working for a clan. When all is said, there is for individuals and for nations such a thing as an apprenticeship of public spirit; and it might be served in a worse school than Tammany Hall. If there is to be forever in the city of New York a system of inadministrable law and illegal administration, the application of the system might be in worse hands than those of Tammany Hall.

But Tammany is committed to that lying system; there lies the rub with Tammany. However little natural gift or liking it may have for the administrative lie, it has accepted its existence, it

has built upon it; its whole vast edifice is overthrown when that is overthrown. It is too much to ask of human nature that a man or that an organization should deliberately and voluntarily renounce its means of life. I am very far from meaning that Tammany is incapable of finding other means of life; with the same resourcefulness with which it has adapted itself to the conditions of the administrative lie, it would doubtless have adapted, it would doubtless still adapt, itself to conditions different from these. But all its work would be to do again. It is the price men pay too often for their power of dealing with the established fact, that they acquire a sort of vested interest in the fact with which they have contrived to deal successfully; they made the best of it because it was unalterable, they desire it to remain unaltered because they have found how to make the best of it. Something like this has happened in the case of the Tammany politician and the administrative lie; he may well at first have found himself embarrassed by it; he could not have rid himself of it if he would. He has been the victim, he has come to be the champion, of the established fact. He may reasonably be reproached with all the evils of the established fact, not because he is its author, but because he seeks to keep it as it is.

And the evil of the established system scarcely can be by any eloquence exaggerated; explain the cause as we may, there can be no question as to the effect. The system of illegal licensing of violations of laws not meant to be observed tends naturally toward the licensing of violations of any and of every law. The collection of such license fees by the administrators, indirectly or directly, tends to give them an interest rather in the violation than in the observance of the law. The very fact that the administrators of an inadministrable law are themselves inevitably lawbreakers tends to throw them into fellowship with other lawbreakers; the very fact that they themselves inevitably stand within the danger of the law leads them to associate themselves with other lawbreakers for the corruption of the higher and the lower courts. In his capacity of Justice of the Court of Special Sessions, Mr. Jerome had, year by year, ample opportunities to see these tendencies fulfilled. He spoke to his audiences of what he saw. He spoke to them not only of the blackmail levied and the lawless power exerted among prostitutes and gamblers and saloon-keepers, but of the blackmail levied on the law-abiding poor. It is not the least among the offsets to the charity of Tammany that what is given to the poor has been but too frequently wrested from the poor.

"Take one small instance," Mr. Jerome said, with his usual picturesque precision of illustration. "Take what looks like a small matter, yet concerns a great many decent men. The conditions of life are hard in a great city like this: the labor market is overstocked. There are a great many people who seek to make their living in the humble occupation of push-cart peddlers; and what do they find?

"These men pay the city of New York for the privilege of selling; have they not a right to sell without squaring it with the wardman? Have they not a right to sell without buying tickets for Tim Sullivan's chowder-parties?" (Voices in the crowd, it is recorded, cried, "That's good!") "I have been told a story of what happened a short time ago, as this election was approaching, and I believe it because it was told me by a man who I am sure has never yet lied wittingly, and because it tallies with the things that I myself have seen. I have been told that all of a sudden, as this election was approaching, the police force descended upon the peddlers of the East Side. They had been getting on very nicely through the summer, with only an occasional shake-down, perhaps, from the Board of Health—of course they had to pay that; it may be, too, with an occasional shake-down from the plain-clothes man—well, of course they had to pay that. Those who had most money had to take occasionally some tickets for a chowder-party; well, they had to pay that. But I am told that as election time drew near there was a great activity of the police force among the push-cart men, so that at last the association of the push-cart men betook themselves in all humility to Martin Engel and asked what they had got to do. And Martin Engel answered, 'You have got to support Tammany Hall.' Well, it was support Tammany Hall or get arrested. It was support Tammany Hall or be pu

out of business. Thereupon the association answered, 'Yes, great one, we will support Tammany Hall.' But once inside the little box on election day, I find it difficult to believe the push-cart men will still be supporting Tammany Hall. Men will do much for friendship—that is human nature; when a man is kind to me, I, for my part, desire to help him all I can. Uptown men say to me, 'Hang it, Jerome, those fellows somehow get down to the hearts of the people. You know they give the outings.' Mr. Hochstim, Mr. Katz, Mr. Engel, and the rest, they seem to think, have twined themselves about your hearts. Heaven help you, then! I think you must have let your hearts slip down into your pockets. It would be hard enough to know where else they can be found entwined."

The next night, in Brooklyn, he recurred to the same theme. "Whatever you may think about push-carts in the street," he said, "there are a great many men trying to make an honest living in that way. Whatever you may think about fruit-stands at the corners, there are a great many men trying to make an honest living that way. And in the midst of those men we have a district leader. And you go to your clubs in the brownstone district, and the politician in the brownstone district says: 'Now, the trouble about the situation in this city is that we do not get down to the hearts of the common people as the Tammany people do.' And Mr. Shepard said the other night in Tammany Hall that the Tammany leaders have entwined themselves in the hearts of the plain people. As I have had occasion to remark before this evening, it seems to me rather that they have entwined themselves in the pockets of the plain people. But we are told that we must get a hold on their affections as the district leader does. Well, you say, what does the district leader do? Why, he gives these people an outing or a picnic. Let me tell you what happens in some of their outings and picnics. Tim Sullivan gets up an outing and a picnic. Tom Foley gets up an outing and a picnic. Wardman Hahn goes out and sells to the peddlers and the keepers of gin-mills and the push-cart men a thousand tickets at five dollars apiece. Another plain-clothes man comes pretty near doing the same. And when I spoke unflatteringly of Mr. Hahn, Mr. Foley came to me and said: 'You are all wrong about Mr. Hahn. He is a very fine fellow. He does not need to be on the force at all. You know he made a great deal of money in Brooklyn Rapid Transit.' Well, one man that has a fruit-stand finds that he cannot get his license renewed. He asks about it. 'Did you take some of Tim Sullivan's chowder tickets?' 'No, I could not afford to do it.' 'Go and do it.' He goes and does it, and gets his license. And at the end of these chowders you find that never a one of them has a deficit. In the old days the district leader used to put the surplus in his pocket, but now they tell me that it goes into the treasury of the local organization. At least they never fail of getting from some $2,500 to $3,000 cash profit, and the securing of that profit is the work these district leaders do. Then, too, the push-cart men have got to square themselves with the wardmen. Then, too, they have got to square themselves with the health inspector. Then, too, they have got to square themselves with other persons who come around representing certain people whom I do not name. And so it goes all through; not vice alone pays its enormous tribute, but honest industry must pay if it expects to live."

Honest industry of all degrees of humility and dignity: one of the stories Mr. Jerome told oftenest during the campaign, because its repetition was demanded oftenest by his audiences, had been first intended as a sort of parable of the difficulties encountered under a Tammany administration in the conduct of honest trade of every kind. "Yes, if you want it, I will tell you the lemon story; it came about this way. There are a number of very earnest and enthusiastic men, with New England consciences, who live in Litchfield County, Connecticut. They formed the Litchfield County Universal Club, they built a club-house, and last summer they asked me to come up there. It wasn't far from a little place I have in the country. I talked with them after dinner, and the toast—there was nothing but apollinaris at that dinner; it was in New England—and the toast that they gave me to respond to, and that I was presumably to occupy about five minutes in responding to, was 'Municipal Problems

and their Solution.' It reminded me of a reporter calling me up about 11:30 in One Hundred and Forty-eighth Street, and saying that the editor wanted an interview that would occupy about half a column upon 'Strikes and their Solution.' Such a simple, easy thing to give offhand, after you had been pulled out of bed in your pajamas! Well, I was up against it, and I had to speak succinctly upon municipal problems and their solution. And I gave a story by way of illustration. I told them it was purely imaginary and symbolic; and this was the case that I imagined—that there was a scarcity of lemons in the New York market, and that a merchant in the city of New York, seeing the situation, cabled to his agents on the Mediterranean, 'Ship me so many thousand lemons by first steamer.' The scarcity of lemons at once caused other shipments, but this merchant, by his willingness to spend money and by reason of his connections abroad, got his $5,000 worth of lemons on the first steamer, which meant probably a gain of thirty-six hours. There was such a scarcity of lemons when the steamer reached the dock that before the next steamer arrived it would enable him to make a profit of at least a dollar a box, which he was fairly entitled to because of his sagacity in foreseeing the conditions of the market and his readiness in meeting those conditions. When the ship arrived, he rushed up to the Custom-House, feeling perfectly delighted. When he had paid his duties at the Custom-House he went down on the dock and a fellow came up and said: 'Are you the man that brought these lemons over?' 'I am.' The fellow threw back his coat and disclosed the shield of an inspector of the Board of Health. He said, 'I think these lemons will have to be hand-picked.' Hand-picking five thousand boxes of lemons meant simply that the merchant would lose his market, because other steam-shipments of lemons would arrive before the hand-picking could be finished. He said, 'What is it worth?' 'Well, two hundred and fifty will do this time.' He had to pay it. He was simply trying to carry on his honest, legitimate business, and so, rather than lose his profit, he paid. Now, this was the story that I told up in the Litchfield Hills. It was a Friday night, and somebody telegraphed to the New York papers enough of the story to show what I was driving at, but not enough to show that I had stated it as a purely imaginary case. Now comes the point. On Monday morning, in my chambers in the Criminal Court Building, I had a visit from a certain person, who, after beating about the bush and lingering a long time, came out at last with the purpose of his errand. He had been directed, he said, by an official of the Health Department to find out how—well, how—'Say, Judge, who put you next about those lemons?'" When fairy tales like these come true, what must we not conclude concerning the plain facts of every day?

Officials such as these are naturally appointed according to a system suited to the duties they are expected to perform. To men of all classes in the city, but in especial to the members of the poorer classes, there can be few matters more important than the food and drink supply. For the rich a secondary system of inspection is provided by the middleman. The poor must take such viands as dealers are authorized to sell. Another of the stories dear to Mr. Jerome's audiences illustrated the method of appointment of meat inspectors. "The Board of Health," said Mr. Jerome, "used to be under the control of Commissioner Michael Murphy. Because of his eminent respectability they have transferred him since to the control of the Police Department; but I am speaking now of what took place in the Health Department in his day. The Board of Health used to appoint inspectors. These inspectors had to submit to a civil service examination, so they used to appoint emergency men, thirty-day men, and used to shift them from one department to another. And there were fruit inspectors and fish inspectors and meat inspectors, and inspectors of every kind whatsoever; and they finally got down to ice inspectors. One day they held an examination for meat inspectors. Well, you know that the civil service is the bulwark of the Nation; you know it is the sole and certain way to keep the public service absolutely pure, and you know that the questions are never so worded that a man of sense can guess from the question the reply. But this was not one of the highfalutin examinations about the chemical constitution of

cellular tissue; it was a practical examination of meat inspectors, who were to pick out mutton and pork and beef and ham—a variety of pork, I believe, and other articles that were sold in the market as meat. And they asked the question, 'Which is ham? Indicate by number.' And all these articles were spread out on the table and were numbered 1, 2, 3, 4, 5, 6, and so on. And the numbers had been given out to the persons who were going to apply for examination—before they came there. Now, there is a man who has made his way by competition to the head of the civil service in the way of Chief Examiner. He is a man by the name of Ireland. He knows a thing or two. The place is not political; they didn't put him in and they can't get him out. And he came along and saw these numbers. Well, it came into his head that, just to see what would happen, he would shift the numbers around. There was not a Tammany Hall man appointed meat inspector. They may challenge that story if they want to. I have Mr. Ireland's letter in my pocket."

Men who selected their subordinates and were themselves selected in this fashion were, besides, the purchasers of every sort of municipal supplies. "There is a very honorable and upright man," said Mr. Jerome, "in charge of one of the departments of the city of New York. He is protected by the civil service law or he would no longer be there. He has no right to say what price the city of New York shall pay for the goods that are supplied him; that is altogether too dangerous a privilege to give an upright and honorable man; but he is so conscientious as to look over the lists of goods supplied to his department and see to it that the quality and quantity come pretty near being what they ought to be. The price is fixed by—well, I fancy Mr. Murphy was in office when this occurred. It was not so very long ago. There was a requisition made in this Department for two pounds of sponges. There is a company in New York—oh, a very sincere, warm, personal friend of Mr. Croker is connected with it—by which this Department is supplied with whatever may be needed, from an anchor to a needle. When the requisition was returned with the goods, there was an item on the bill that read, 'Two pounds of sponges, $5.' Well, the gentleman of whom I have spoken took the bill, looked it over, checked off 'One electric stove,' which could have been put in for $150 and which was put in for $350, and finally arrived at the 'Two pounds of sponges, $5.' 'John, where are the sponges?' 'Here, Doctor, two little nub sponges.' 'Put them on the scales, John.' John put them on the scales and they weighed four ounces. The next day round came an agent of the company. 'Well, Doc, have you O. K.'d our bill?' (Of course all the Doctor has to do is to O. K. as to quantity and quality.) 'No,' said he, 'I have not O. K.'d it. You will have to make those sponges right or cut them out.' 'The sponges are all right.' 'No,' said the Doctor, 'there are no two pounds of sponges here; we put them on the balance and they weighed only four ounces.' 'You don't mean to say,' exclaimed the agent, with a profane expletive expressive of the most scornful contempt, 'that you weighed them dry!'"

The city's contracts for building materials were but too likely to be given to contractors of the same traditions as the firm whose agent was startled by the unaccustomed notion of weighing sponges dry.

The unrestricted liberty of the official purchaser was symbolized in still another anecdote told more than once by Mr. Jerome.

"An Irishwoman bustled into a department store and met the floor-walker.

"'Oi want a crrevette,' said she.

"'Oh, you want a cravat, madam," said he.

"'Sure,' said she.

"'Third counter to your right, if you please, where the saleslady stands under the window,' said he. So she bustled to the third counter to the right.

"'Oi want a crrevette,' said she.

"'A cravat?' said the saleslady; 'what kind would you prefer? We have four-in-hands, Oxfords, and a variety.' The Irishwoman reflected.

"'Perhaps the gentleman has some choice?' said the saleslady.

"'Divil a bit of choice has he. He will wear anything I put about his neck. The gintleman is a corpse!'"

[TO BE CONTINUED]

PHOTOGRAPH BY UNDERWOOD & UNDERWOOD

The New Archbishop of Canterbury

The Right Reverend Thomas Randall Davidson, at present Bishop of Winchester, has been chosen to succeed the late Most Reverend Frederick Temple, D.D., as Archbishop of Canterbury. To this exalted position Dr. Davidson brings peculiar qualifications. In the first place, although popularly supposed to belong to the broad Evangelical party, he really represents every party in the Church; in the second place, his long and careful training for the primacy was derived from his brilliant student days at Trinity College, Oxford, his curacy in Kent, his chaplaincy in the service of Archbishops Tait and Benson, his deanship at Windsor, and finally his accession to the Episcopal Bench—first to the See at Rochester, and next to the great historical See of Winchester; moreover, Dr. Davidson will grace the Archbishopric by reason of his notable urbanity of manner. It may be remembered that when Mr. Spurgeon died, Dr. Davidson followed him to the grave and gave the benediction there.

TOPPING OUT THE GRAIN-STACKS OF J. W. MADREY, A COLORED FARMER OF CALVIN

TWO GENERATIONS UNDER FREEDOM

BY BOOKER T. WASHINGTON

With Photographs by C. W. Chandler

I HAVE often been asked to what extent the Negro race has the ability for self-direction and government, and the power to initiate and to make continuous progress unaided.

I want to try to answer this question, in part at least, not by abstract argument, but by telling the story of a self-governing community of colored people.

The group of negroes whose story I want to tell reside in Cass County, Michigan. Among the early settlers of that part of the State were several Quakers who had left their former homes in the South because they did not approve of slavery. In Michigan, as elsewhere, these Quakers soon let it be known that not only were they opposed to the institution of human slavery, and that runaway slaves would receive a friendly welcome among them, but that they would also receive physical protection if necessary. In addition to becoming an asylum for escaping slaves, this community of Quakers soon became a station on the "Underground Railroad."

The townships in Cass County in which the Quakers for the most part settled were named Calvin and Porter. It was about the year 1840 that a few colored people, mostly from Kentucky, began to find their way into these townships. Every year after that the number of escaped slaves grew larger, until in the year 1847 a determined effort was made on the part of some slaveholders to recapture their runaway negroes. Quite a nnmber of slave-owners or their representatives appeared in Calvin township in that year, coming in one band, mounted and well armed, and made a bold and determined effort to regain possession of their property and return it to Kentucky. The effort at capture was successfully resisted by the Quakers, the colored people, and other residents of the community.

While a few of the colored people, as a result of this raid, became uneasy and fled to Canada, the ultimate result was to advertise Cass County, Michigan, as being a part of the country where negroes could enjoy a reasonable freedom from the constant fear of being snatched up and returned to their former masters. After the "raid" a still larger number of colored people began to go into the two townships named, and they covered a much wider territory than the first settlers. In addition to those who came directly to Michigan, not a few escaped slaves left Ohio, where they had first located themselves, in order to settle in Cass County, where the good Quakers had so effectually proved their courage and loyalty.

It was not, however, until the year 1849 that one of these townships, Calvin, began to assume the character which invests it with special interest at present. In 1847 a large slaveholder by the name of Saunders, who lived in Cabell County, Virginia —now a part of West Virginia—died. When his will was opened, it was found that provision had been made to the effect that all his slaves must be made free. The will further provided a generous amount of money which was to be used in removing all of the testator's slaves into a free State. In addition, the slave-owner made arrangements for the purchase of a tract of land in some free State to be divided among these people, and the building of a house for each of his former slave families, the will also providing the money to do all this.

The Saunders ex-slaves, forty-one in number, at last were started northward. One who was entitled to accompany them refused to go into a land of freedom, even with all the added advantages of this opportunity, because his wife was a slave and could not go with him. After a long journey, which was attended by many hardships, the members of the party finally reached their Michigan home a few days before Christmas. A large tract of land which was a complete wilderness had been purchased by the executors.

SAMUEL HAWKES, THE LARGEST TAXPAYER IN CALVIN
His tax for 1902 was $154.36

This tract was divided into parcels of eighteen acres for each individual—men, women, and even infants—the youngest baby getting as much as the oldest man. A small log house of such style as was common for the settlers in that country at that time was erected for each family.

The Saunders families—for each family took the name of the former master of the slaves—found their first winter in the wilds of Michigan in sharp contrast to the temperate climate they had left behind them in Virginia. They underwent a great deal of suffering. Not only were they unused to the climate, but they had to clear land for the spring planting in soil to which they were not accustomed. Their Quaker friends, as well as the colored people already residing in Calvin township, were most kind to them, but the rigorous climate, as well as the sudden change in methods of living, began to tell

upon these people in rather a discouraging manner before many months in their new home had passed. It soon became evident that there were some things that the mere gift of freedom and the gift of lands and money could not do. Freedom, lands, and money could not give one experience in self-direction and self-dependence. In the words of another, "Freedom is a conquest, not a bequest."

For several years the Saunders families were in a majority in the township, and they prospered in a reasonable degree. But, as time passed, many of them began to let their wants increase faster than their ability to supply these increased wants. In their extravagant ideas and practices they began to demonstrate the truth of the old saying that a man values only what he has had experience in accumulating. Besides this, while these new settlers were in the possession of lands and houses, they were without education. Some of them began to give mortgages on their land, and while their good Quaker neighbors would protect them in their freedom, and help them to get an education, they were not averse at any time to driving a shrewd and safe business bargain. Not many years passed before a good part of the land once owned by the Saunders families began to fall into the hands of the Friends.

I will not recite in more detail the story of the Saunders community, except to say that most of the property owned by these people gradually passed out of their hands in one way and another, some part of it being secured by other shrewd colored men who had settled in Calvin township. I think I make a correct statement in saying that when I visited the township a few weeks ago I found only one of the original Saunders settlers who at the present time owns any of the land bought by the executors of the Saunders estate. The bare mention of "a Saunders family" would quite likely cause a quiet smile to creep over the face of one of the old inhabitants who did not belong to that group. These people not only had not held their own materially, but I found that, a few years after the newcomers began to get planted in their free homes, not a few of the young men began developing habits of idleness, not a few became criminals, while still others made themselves offensive to the whites and sensible blacks by becoming "uppish" and in other ways disagreeable. All these things resulted in giving the community something of a bad name for several years.

From the foregoing some may draw the conclusion at once that the whole effort was a failure. Not by any means. What I have stated simply emphasizes the fact that human nature is very much the same, no matter under what color of skin it is found. What I have related of the history of the Saunders community illustrates what I have often tried to say in relation to my race in general in this country—that the first one or two generations of freed people would naturally in many cases mistake freedom for license and would be overcome, in a large measure, by the first temptations of their new life; but that the second or third generations would begin to settle down to hard, sober business. If any one wants to get direct and specific proof of the truth of this statement, he should spend one or two days, as I have done, in making a first-hand investigation of the present condition of the negroes in Calvin township.

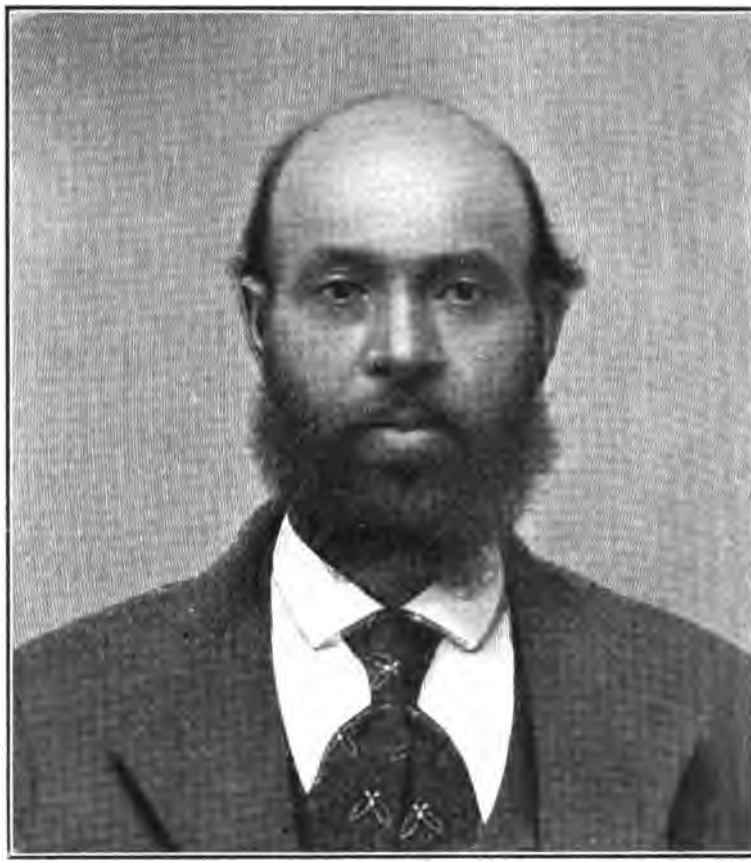
My visit of inspection, however, before I had been in the township two hours, taught me that the weak points exhibited by the people of the earlier generations had wrought a most beneficial work. It is often said that a thing that is bad has to get worse before it gets better. This I found to be true of Calvin township. At about the time when matters had gone down to their lowest ebb, industrially and morally, the more level-headed of the colored people began to realize the situation and to resolve that by strong and earnest effort they would bring about a reform. At about this time there began coming into the township a different class of people. These came mainly from Ohio, North Carolina, and Virginia. As a rule, they or their parents represented a class of people who had been set free—the class which in North Carolina were termed "free niggers," a designation which, strange to say, was used as a term of contempt by negro slaves as well as by their masters. The main point that I want to bring out here, though, is that these later settlers, either in Ohio or in some of the Southern States, had got over the first flush of freedom, and so were ready to

THE BARNYARD OF BILL ALLEN'S FARM

settle down to business when they reached Calvin township. The money and the experience that these people brought with them to Calvin had been dearly earned by themselves. This new element joined itself with the better representatives of the earlier settlers, and very soon Calvin township began to acquire a new atmosphere. The real solid growth of the township began from this time.

My attention was first attracted to this settlement some years ago when I was in South Bend, Indiana, the site of the Studebaker wagon factories. I noticed that the colored people of South Bend seemed to be an unusually prosperous and solid lot of people, far above the average of those generally found in large cities, or anywhere in the North. I asked one of the Studebakers the reason for this difference, and he said that he thought it grew out of the fact that from the first the Studebaker firm had never permitted any color line to be drawn in any department of their works—that a negro was not made to feel that on account of his race he was assigned to a certain minor place in the factory, and could not hope to rise above that place, no matter how well he did his work. Mr. Studebaker said that they had held out to their negro workmen the same hope of reward in the way of promotion or increase of pay that the white workmen had held before them. There is a lesson in this treatment of the negro workmen by the Studebakers that has in it a solution for many of the problems connected with the negro. Take away from any race or individual the hope of reward, and you help destroy the race or individual.

From this discussion of the condition of the colored people in South Bend, Mr. Studebaker called my attention to the large community of colored people in Calvin township, Michigan, which is not very far from South Bend, since Cass County, in which Calvin is situated, is on the southern boundary of Michigan. When I asked Mr. Studebaker about these people he said in substance that for a number of years his firm had sold them wagons and other farm machinery, and had often sold



BILL ALLEN AMONG HIS CATTLE

on credit; and that in all their business relations of recent years they had proved themselves just as reliable and prompt as the white people in the same county, or anywhere in the State. This statement so interested me that I resolved to see this community for myself at the very first possible opportunity, because I had always been anxious to see just what progress in self-government any large number of people of my race could make when left absolutely to themselves and given the advantage of the climate and location that the average white man in America possesses.

In connection with what I am going to say it should be kept in mind that the unit of government in Michigan, as in Massachusetts, is the township—that is, each township has practically complete self-government. Besides this it is entitled to at least one representative on the Board of County Commissioners which controls the affairs of the county.

When I visited Calvin township recently I found that it contained a population of 759 negroes and 512 whites. In addition to these, a large negro population had overflowed into the adjoining township of Porter, and to some extent into all but two of the towns in the county. The county seat of Cass County is Cassopolis. The nearest boundary line of Calvin township is about six miles from Cassopolis.

As I drove, in company with the Hon. L. B. Des Voignes, the probate judge of the county, Mr. Max Bennett Thrasher, a newspaper writer, and Mr. Jesse W. Madrey, the latter one of the most prosperous colored farmers in the county, from Cassopolis in the direction of Calvin township, we soon began going through well-cultivated farms and past comfortable-looking farm-houses. The farms, for the most part, in their general appearance compared favorably with the average farms we saw in Michigan. Many of the houses were large, attractive, and well built. The yards were made beautiful with grass, shrubbery, and flowers. The barns, stock, poultry, and other

CORNELIUS LAWSON
Supervisor of the township of Calvin.

farm attachments were in keeping with everything else that we saw. In our drive of nearly ten hours, in which we covered thirty miles of territory, through Calvin township and a part of Porter, the adjoining township, we saw little to indicate that we were in a negro town except the color of the faces of the people.

They were up to the average of their white neighbors. There are perhaps few townships in the South among the agricultural classes that would compare favorably with this one.

In a few cases it was interesting to see standing on the same premises the small cabin in which the people began life years ago, and then to see near it a modern frame cottage containing six or seven rooms. To me it was interesting and encouraging to note to what an extent these people "lived at home," that is, produced what they consumed. My visit took me through the community during the harvesting season, and at that time most of the farmers were engaged in threshing wheat and oats. On one farm we saw a large, modern steam thresher at work. Around it were employed some twenty men. This complicated piece of machinery was being operated wholly by negroes, and, what was more interesting, was owned by a negro by the name of Henry L. Archer. Mr. Archer not only threshed grain for the negro farmers in his township, but for the white farmers as well.

In speaking of the extent to which these people "keep themselves," I want to say that their home-raised and home-cured pork was, without any reservation, the best I ever tasted. I was particularly struck with this when visiting the home of Mr. Allen, of Porter township, the negro stock-raiser and stock-trader. "Bill" Allen has as

high standing for probity and shrewdness among the people in the Chicago stock-yards as the average white man. His many well-filled barns and the large number of valuable horses, cows, pigs, and sheep he owns were among the most interesting sights that I saw.

William Allen was born in Logan County, Ohio, but his parents were free colored people from North Carolina. To speak in more detail about Mr. Allen, I found that he owns seven hundred acres of land, and that the taxes which he paid last year in the two townships of Calvin and Porter amounted to $191. When I visited his farm, he had fifty head of cattle, ten horses, three hundred sheep, and twenty-five hogs. All of his property is paid for. Mr. Allen is one of the few men I have heard of as resigning a political office. He was a Justice of the Peace for eighteen years, and resigned because it took too much of his time away from his farm.

It was rather remarkable to learn that Samuel Hawkes, a fine specimen of the race, pays the largest tax of any one, white or black, in the township of Calvin. His tax this year was $154.36. In addition to this, Mr. Hawkes paid over $50 taxes on property which is in his charge as an administrator. He owns about five hundred acres of land, free of encumbrance. He is highly spoken of by every one whom I saw, of both races, including the county officials and the cashier of the bank at Cassopolis, who said his credit was good at that institution. I was told on good authority that Mr. Hawkes is worth $50,000. He has perhaps learned the lesson that not a few white people have learned—not to give in all of their property for the purpose of taxation.

Samuel Hawkes was born in Nottaway County, Virginia, in 1828. In 1837 he moved to Jackson County, Ohio, and remained there until he came to Calvin in 1853. He is entirely a self-made man, beginning work for himself at the age of sixteen, cutting cordwood. He had saved up enough money so that when he came to Calvin in 1853 he was able to buy the eighty acres of land on which he still lives, paying for it $800 in, as he expresses it, "gold and silver." He then went back to Ohio and worked there six years longer before he came to Calvin to live permanently on his farm. For the last quarter of a century Mr. Hawkes has devoted himself to the general manage

THE TOWN HALL IN CALVIN, WITH THE SUPERVISOR, TOWN CLERK, AND TWO OTHERS

ment of his property, loaning money, and dealing in real estate.

Cornelius Lawson, the Supervisor for Calvin, is a native of North Carolina, whose parents moved to Cass County after an intermediate residence of some years in Indiana. He has lived in Calvin since 1853. He was elected a Justice of the Peace in 1878, and retained the office until the present year. In 1899 he was elected Supervisor, and has been re-elected every year since. Mr. Lawson is a farmer, and lives about a mile from "The Corner"—the official center of Calvin. He is the first colored man to be elected to the County Board of Supervisors.

It would be difficult for me to give a better idea of the industry and prosperity of these people than can be obtained from reading the following extract from a letter which I received not long after my visit to Cass County. The letter is from one of the most reliable colored men in the county, and, I ought to add, was written with no thought that it was to be published:

Cassopolis, Michigan, November 3, 1902.

Mr. Booker T. Washington:

Dear Friend—I will impose upon your precious time only long enough for you to read this, as no answer is necessary.

I wanted to tell you that I thrashed those stacks of grain that you saw when at our place. Mr. Archer did the thrashing in one day—944 bushels of oats and 884 bushels of wheat. I paid him $41.44. On the 29th I shipped a carload of hogs and sheep of my own raising to Chicago. I received $707.30 for the same. I have 167 sheep left and about 80 head of hogs; this includes all sizes. . . .

Your humble servant.

J. W. MADREY.

I found that there was another colored man in the township, Mr. C. W. Bunn, who owns two sawmills and much other real estate. He is said to be worth $50,000.

In several cases I noticed that the carpets on the floors of the homes of the people were of the home-made kind, but they were handsome and substantial. A considerable number of the colored people in Calvin township own their homes, and many of those who are renting are doing so from negro landowners. In a few cases white people in the county are renting property owned by negroes.

There are, I believe, eight schools in Calvin, four of them taught by colored teachers. Not only are the teachers colored, but the schools are controlled by negro school officials for the most part. As we drove through the township I found a copy of the following notice posted:

ANNUAL SCHOOL MEETING

State of Michigan

NOTICE is hereby given to the qualified Voters of School District No. 8 of the Township of Calvin that the Annual Meeting of said District will be held at the Schoolhouse on Monday evening, the 1st day of September, A. D. 1902, at 8 o'clock, for the Election of School District Officers, and for the transaction of such other business as shall lawfully come before it.

Dated this 25th day of August, 1902.

C. F. NORTHROP, Director.

Mr. C. F. Northrop is a negro. So far as I could judge by the appearance of the teachers and the school buildings, they compared favorably with others in that part of the State. In addition to the negro teachers and ministers, there are two negro physicians in the township.

One question that is often debated is as to the ability of the negro for self-government from a political point of view, and I was extremely anxious to get information on this. In Calvin township in 1900 there were 759 negroes and 512 whites. I made diligent inquiry to ascertain if there was any friction between the two races, and could find no evidence that there was. Judge Des Voignes and other county officers informed me that there were no reports of cheating at the ballot-boxes, and that the affairs of the township were conducted as well politically as any in the county. For some years, the Judge said, it had been the boast of the negro tax collector of Calvin that he was one of the first collectors to secure and pay into the county treasury all of the township taxes. On one recent occasion it was said that when another town was trying to beat Calvin in this, and the Calvin tax-gatherer's report was delayed, largely through the tardiness of one negro taxpayer, whose tax was only three dollars, rather than have Calvin lose its reputation for promptness a number of the public-spirited negroes "chipped in" and paid the tax of the delinquent.

Each township in the county is entitled to one representative on the County Board of Commissioners which has the control of the affairs of the entire county. The representative of Calvin is a black man, and I was told by several white people of the county that the negro Commissioner

THE HOUSE IN WHICH MATTHEW ARTIS LIVED FORTY YEARS AGO

voted intelligently and conservatively. So far as I could find evidence, there had never been in the township any "scandal" growing out of the misuse of money by public officials, notwithstanding, as I have said, that each township levies and collects its own taxes for schools and other public enterprises.

I was a little curious to see to what extent the colored people took interest in

THE HOUSE OF MATTHEW ARTIS, JR, WHO HAS KEPT WHAT HIS FATHER LEFT HIM AND HAS ADDED TO IT

the large National questions. I asked a good many of them how they stood on the question of reducing the tariff on Cuban sugar. In spite of the fact that Michigan is producing much beet sugar, I found that most of the colored people in this township were in favor of helping Cuba, and they were not slow to give their reasons. Later I found out from the rural free delivery mail-carrier that forty daily papers were taken in the township.

ABNER R. BYRD
Town Clerk of Calvin.

Some years ago a certain Congressman who represented that district in Congress got into the habit of coming to Calvin whenever an election was pending, to speak to his colored constituents, but instead of discussing the broad National questions of the day he would "jolly" the colored people. They stood it for a while, and then they let him know, in no uncertain way, that if he wanted to speak to them he must discuss public questions in the same manner that he did in other portions of his district.

The seat of government for the township is the town hall, which is located near the center of the township. It is here that the town officials have their offices. The principal business of the town is transacted through the town meeting, very much after the manner in New England.

I was informed by several reliable white men of the county that there had never been any trouble worth mentioning growing out of political differences. When the war between the States broke out, as soon as colored soldiers were permitted to enlist, practically every negro man in the township who was eligible enlisted and went to the front. As a result, there is a Grand Army Post in Calvin named Matthew Artis Post, in honor of one of the old settlers and soldiers. The Grand Army Post meets in a hall on the second floor of the town house. The present commander of the Post is Bishop Curtis, who was a member of the Fifty-fourth Massachusetts Regiment. It is said that he was wounded by the same shell that killed Robert Gould Shaw.[1] The post has been established twelve years, and is in a flourishing condition.

There are three churches in the township, two of which I saw—one an African Methodist and the other a Baptist. One of these was established in 1853 and the other in 1854. Both of these congregations have neat and attractive buildings. Although I had caused word to be sent ahead of me that I did not want to make any address to the people, but simply wanted to be permitted to visit them on their farms and in their homes, and thus see them when they were not on dress parade, I found that when our party reached the Methodist church rather late in the evening we were welcomed by a brass band composed of young men living in the community, and it seemed to me that the whole township had assembled. Nothing but a short address would satisfy them. The most general complaint that I heard at this meeting, and from several individual farmers with whom I talked, was to the effect that the young men were too

MATTHEW ARTIS
Treasurer of Calvin Township.

[1] To whose memory the very beautiful and famous monument by the American sculptor St. Gaudens has been erected on Boston Common.

much inclined to leave the township and go to the large cities.

In my inspection of their church houses there were two things that specially pleased me. One was the fine and neat appearing parsonage which stood near the Chain Lake Baptist Church; the other was the appearance of the graveyard near the same building. The church house, the parsonage, and the graveyard gave one a picture which made him feel that he was in a Massachusetts village. The graveyard was laid out in family plots, and most of the graves had marble slabs

HOUSE OF J. C. EARLY IN CALVIN

or headstones. There were evidences that the burial-place received systematic care.

I thought that it would prove of interest and value to get the opinions of some of the prominent white people of Cass County as to what they thought of the members of my race in Calvin. With this end in view several of the leading men in Cassopolis, the county seat—a beautiful, substantial town of several thousand inhabitants—were consulted, and the following questions were at some point in the conversation asked of each one of five men interviewed:

How does the material condition of the colored people of Calvin compare with that of twenty years ago?

How does it compare with that of their white neighbors?

How do the moral conditions compare?

What is the nature of the relations between the two races?

Do many of the colored people move away, and if so, why, and where?

Have they contributed as much towards the prosperity of the county as the other residents?

Do you know of any other colored community so prosperous?

In criminal offenses in the township do the colored people assist the officers willingly? In other words, does civic pride outbalance race sympathy?

Judge L. B. Des Voignes, who has been Judge of Probate of Cass County for six and a half years, and previous to that was Prosecuting Attorney, said:

"The material condition of the people has greatly improved in the last twenty years. They have more wealth, better farms and homes—they live better. Their conditions have kept parallel with the whites. Considering their opportunities, they have advanced. Their moral condition has improved very much. There has been a great decrease in criminal conditions during the last twenty years.

Calvin does not give us—the courts—as much trouble now as some of our white communities. There is increased membership in churches, and increased attendance at schools. There is more desire for education. There are six schools in Calvin in which white and black go together. The relations of the two races are mutually pleasant.

"I do not recall any instance where white residents of the township have objected to colored people buying land there. I do not think there is any depreciation in the price of land. To a stranger buying land the colored residents might be an objection; but I do not think it would be to those who know the colored people of Calvin. A slightly larger proportion of the young people go away to the cities of South Bend, Elkhart, Dowagiac, Niles, etc. They go because they can earn more money.

"The colored residents have helped to contribute to the prosperity of the county, considering the opportunities they have had and the length of time they have had to earn money. There is a prosperous colored community in Volunia which is frugal, etc. This is small, though, not more than one hundred persons, and might, perhaps, be called a part of this. There are colored residents in several of the townships in Cass County. The treasurer of Calvin was one of the first to report the payment of every tax in the town. The better element, the property-owning class, are quick to assist in the conviction of criminals."

Mr. Charles O. Harmon, clerk of the county, was born in Porter township, and grew up among these people. He taught his first term of school in the Mount Zion school-house. Mr. Harmon said:

"There is practically no difference in the material condition of the people of the two races in Calvin. They are more prosperous than twenty years ago, particularly in having better farms and better houses. The moral condition is equal or nearly equal to that of the whites. There is a low and illiterate class, but not large considering the opportunities of the people. They take advantage of their opportunities as much as the whites. They are quick to take advantage of improvements, such as the telephone and improved machinery. There has been great improvement morally in the last twenty years.

"Some of the best people of the county live in Calvin and mingle with these people in a business way with no distinction. I do not think that the fact of the colored settlers being there is considered any detriment to the community, although white people from communities which have no colored settlers might be averse to buying land there. Certainly land does not sell for any less there. The land in Calvin is among the best in the county. The merchants of Cassopolis find these people extra good customers. That may be one criticism to make—that they buy too freely for their own good. As a general thing, though, they are good pay, and take a pride in meeting their obligations.

"They have, probably, helped the county as much as could be expected of any people with their opportunities. I should say that they have helped in this way only during the last ten years. The tendency in this respect is good. The present colored Supervisor is the first colored man to hold this office. He is an able man in official work. He is a member of the county Committee of Equalization, and of the Committee of Public Grounds and Buildings. He was a delegate from the last County Board to the State Board of Equalization of Taxes, at Lansing."

Mr. C. C. Nelson is an undertaker in Cassopolis, who does most of the work in his line in Calvin. He has lived in Cass County for sixty years, and has been postmaster, sheriff, and overseer of the poor. He said in substance:

"There is no township in Cass County that has made so much improvement in the last twenty or twenty-five years as Calvin has. The people were once haphazard and lawless. At one time Calvin furnished two-thirds the court business of the county. That is past now. They have improved more, proportionately, than the whites. As a rule, the whites feel friendly towards them; better than formerly. People who know them make no objection to them. People who live in Calvin would not sell their land there any cheaper because of the colored population. Probably more of the young people go away. They put civic pride before race pride."

The Hon. L. H. Glover is a prominent

STEAM THRESHER OWNED AND OPERATED BY HENRY L. ARCHER, A COLORED MAN, THRESHING A COLORED FARMER'S GRAIN

Democratic lawyer of Cassopolis, and has been a Justice of the Peace there since 1862. He said: "The first generation of settlers were fine men—none better. The second generation was bad. The third shows a very marked improvement. But through it all the best men have supported the law unfailingly. There is a steady improvement morally, and this compares favorably with that of the whites. There is no social mingling, but otherwise the relations of the races are entirely friendly. I do not know of more than a dozen marriages of whites and blacks in the entire county. So far as prejudice towards the colored residents of the county is concerned, the farther away people live, the greater the prejudice. As they approach, it grows less. These people have contributed as much to the prosperity of the county as ought to be expected of them."

Mr. Allison, the proprietor and editor of the Democratic paper in Cassopolis, practically confirmed all of Mr. Glover's opinions. Mr. Allison, like Mr. Glover, has lived in the county for many years, and knows the colored residents well.

As I mingled with the white people and tried to draw them out freely, I got the idea pretty strongly that while they saw the weak points as well as the strong ones in this interesting little African colony, yet, on the whole, the whites were very proud of Calvin township and watched its development with deep interest and not a little satisfaction. In the story of this development there is nothing startling or remarkable. It is simply the story of the growth of a people when given the American chance to grow naturally and gradually. With the negro, whether considered as individuals or in groups, I find that the bearing of responsibility is one of the chief essentials of growth.

An Open Fire

By Frank Dempster Sherman

For ages, dreaming in the coal,
Has slept in earth the shining soul
Which waking brings to Winter's night
Some ancient Summer's warmth and light.

PHOTOGRAPH BY GESSFORD

Major-General Francis V. Greene

New York's new Police Commissioner, General Greene, by his prompt and firm action justified his appointment by Mayor Low within a week of taking office. His vigorous action in sending back to posts as patrolmen the wardmen, who, as every one knows, have always been the personal agents of the captains in collecting blackmail, showed that General Greene was not afraid to take radical steps. This has been followed by other equally vigorous actions. General Greene is a West Point graduate, was an instructor in the Military Academy for a short time, was a military attaché at St. Petersburg for two years, and served with distinction in the war with Spain, both in Cuba and the Philippines. At the close of the war he was promoted to the rank of Major-General. He has written on military subjects. Recently he has been president of the Asphalt Company of America.

"Livin'-Out Girls"

By Alice Ward Bailey

WHEN William Edson came home to supper that night, his wife met him with a troubled face. "What's the matter, Fanny?" he inquired, briskly. Edson and his wife were like the little figures in the thermometer which emerge alternately; her cloudy weather made his fair.

"*Annie's gone*," was the reply. Emphasis took the place of eloquence.

"Gone where?" inquired William, with increasing cheerfulness.

"Gone to Nora. I knew when Nora left and sent Annie that Annie'd go in the same way. These 'livin'-out girls,' as they call themselves, are all just alike. And here it is midwinter, and Aunt Martha coming."

"But," pursued William, trying hard to understand, "what does Nora want of Annie up at Mike Shay's? Is she going to tend the baby?"

"Why, William, I told you weeks ago that Nellie's baby died and Nora went to Hartford."

"So Annie's gone to Hartford with Nora."

"Of all the men! Why, Nora's *dead*."

"Nora *dead!* Why on earth didn't you say so?" exploded William, his amiability finally giving way beneath the strain imposed upon it. "What happened to her? Poor Nora! Who brought the news?"

"Mike Shay," replied Fanny, still speaking in an aggrieved tone. "Mrs. Elkins was here making a call. We thought we heard something, a sort of moan, but I thought it was out on the street. It sounded like an animal that has been hurt. Mrs. Elkins said it came from the kitchen, and after a while when it kept on I went out there. It was Annie. She was rocking back and forth and crying, and Mike was trying to make her keep still; but you know how those people are, so emotional. I told her she had better wait until to-morrow, until the body comes up, but she *would* go *now*. The funeral isn't till day after to-morrow, and with the wake and all she won't be fit for anything for a week, if she comes back [illegible] which I doubt. I haven't a [illegible] one of them. Are you ready for supper? There's a letter from Harold."

"Is there? What does he say?" Edson stretched out a long arm and seized the letter from his boy.

Very different became the tolerant, easy-going husband of Fanny when merged in the father of Fanny's son. Alert and watchful, he read every word of the closely written pages in his hand.

He laid them down with a sigh which told of desire stimulated rather than satisfied.

"He's doing well in his studies," he said with pride; "any one can see that; but I wish he'd tell us more of himself. He's an awfully reserved chap." He sighed again as he rose from his chair.

"Are you ready for supper?" repeated his wife. She was as noncommittal as her offspring; but when Fanny did not reveal the inner workings of her mind, it was safe to question their existence. So her husband assured himself as he answered briefly, "Shall be in a minute."

He walked slowly upstairs, removing his collar and tie as he went; his thoughts reverted to Nora. "Poor girl, it's too bad," he murmured. "She was a good girl, a first-rate cook and a fine laundress." The words brought a smile. One would think he was recommending the girl to service in another state similar to that which had occupied her here.

"Supper's ready," called Fanny at the foot of the stairs.

"And a good supper, too, I know," he responded, rubbing his hands with anticipation as he entered the dining-room.

"I've only put together some odds and ends," exclaimed Fanny, with a toss of the head. "You'll have to make a fire in the morning, and fill the teakettle, and set on the oatmeal." It was some comfort to show William another side of the picture.

It was a side which obtruded itself upon his recognition the following evening when he found Fanny in bed with a headache and the dinner dishes unwashed.

"How would it do to get Mary Sullivan in for a few days?" he inquired ten-

tatively as he sat on the edge of Fanny's bed and sympathized.

"Now, William, you know," began Fanny, pushing up the bandage which covered one half her face and letting out a pair of inflamed gray eyes.

"Yes, I know," interrupted William; "she had one of your blue china teacups under a stool in her room for a month. She probably carried it up with something in it, and how could she put it back when you kept asking for it? What beats me"— William was growing reckless— "is how you knew it was there."

"We won't argue *that*," replied his wife with dignity, and retired into her bandage again. "If *you* want Mary, you can have her."

"I guess I'll see her," decided William, accepting the concession and ignoring the manner in which it was made. "You just lie right where you are, Fanny. I'll look after everything. Hadn't you better take your drops?"

Fanny took her drops and renounced responsibility; William accepted it and made haste to bestow it upon Mary, whose ample shoulders and broad, benignant brows looked capable of sustaining any load the Edsons might impose.

She'd "come the night if Mr. Edson said the wor-rd, though she was thinkin' of goin' to Nora's wake. Yes, sir, that's Mike Shay's, all lighted up; didn't ye know it was so near? You'd a right to go over, sir," she declared; "Nora is cert'nly the beautifulest corpse I ever set eyes on, I'll say that for her." One would infer that the chief end of man was to become a corpse of some kind, and that Nora had reflected glory upon herself and proved a credit to her friends by the manner in which she had discharged her obligation.

"Were you going over right away?" asked William, with an interested glance in the direction of the ceremonies.

"Yes, sir," replied Mary, cordially. "Would ye like to go along? *Would* ye now, *ray-ly?* Wait a minnit till I put on me shawl."

She threw it quickly over her head and led the way between two high walls of snow to Mike Shay's little house. Modest as it was, it had held the material for more than one tragedy. In that corner room upstairs Mike Shay's mother had shut herself away, refusing to welcome her only son's young bride, and there the old woman had died, stubbornly rejecting all offers of food or assistance. Nora herself, the bride's only sister, had so opposed and hindered the wedding that its progress resulted in an open rupture between the girls, lasting until Nora threw up her situation and hastened to nurse Nellie through that terrible illness when the baby was born and lived one sorrowful day, every moment of it spent in Nora's devoted arms.

The light streamed out from a tall piano lamp, one of Nellie's wedding presents, and fell on rugged faces passing in.

"This way, sir; mind the step," whispered Mary. William followed mutely.

Within the kitchen, through whose open door appeared a vision of a white form lying among flowers, Mary dropped upon her knees with a muttered prayer. William slid into a dark corner, where he was made at home by one of his workmen, Tom McCarty, who greeted him in a loud whisper.

"Yes, sir, it was very suddin," commented Tom in response to William's conventional salutation. "Such a fine lar-rge gur-rl and looked so well; anny one would have taken a lase of her life. No, sir, she wasn't with friends exactly; they was some folks that had come out from home and she wanted to hear. They was tuk sick and she had the care of 'em, and she wasn't well from nursin' Nellie. Whisht, there's Nellie now; she looks more like the dead than the livin'."

Across the vision of the white form among the flowers moved a slender black-robed figure, every line tense with emotion. At its beckoning another black-robed figure arose from a corner and came forward. In the blaze of the candles William recognized Annie. Her hands were full of pipes and tobacco, which she distributed among the men. Mike meanwhile was arranging a huge brown pitcher and some tumblers conspicuously on a table. Both recognized William with a nod and a "Good-avenin', sir," but neither betrayed any surprise. They, and indeed the entire roomful of men and women, appeared to be under a spell. Upon their faces as they went to and fro was a look of exaltation. Under its influence the dingy kitchen, lit by the incongruous "piano lamp," took on the atmosphere of a chapel

whose shrine was the inner room with the dead girl and the candles and the flowers. Friends and neighbors continued to arrive, now a workman bending his stiff knees and bowing his head in prayer as he entered, now a woman throwing off the shawl which covered her head and glancing furtively towards the inner room while she fingered her rosary.

William watched them idly; he felt like a spectator at a play, somewhat nearer the footlights than usual, but no more a part of the performance than if he had been by himself in a stall. Suddenly he was thrust into the forefront of the action—himself and one other to whom the kneeling men and women were only a part of the *mise en scène*. Stooping to enter the low doorway came a familiar figure. William clutched the sides of his chair—what was *Harold* doing here?

Without genuflection or prayer, but with a manner which seemed somehow to include both, the young man entered and took an inconspicuous seat. The father's heart beat stormily. He filled the pipe which Annie had given him and steadied his nerves with half a dozen long pulls. Harold in his corner was doing the same. He had not seen his father; indeed, he seemed not to see any one. He was as pale as Nellie herself, and, like her, apparently unconscious of the murmur of voices which had risen since the distribution of pipes and the circulation of the pitcher. The talk ebbed and flowed with gentle insistence, hushed and other-worldly as befitted the occasion and having to do mostly with some one who had died or was about to die. William watched his boy, hearing and not hearing until Mary's husky whisper asserted itself in his ear.

"*She'll follow him soon*," was the announcement, full of mystery and prognostication.

"How d'ye know?" demanded the woman beside her.

"The dhrames she's had," muttered Mary, impressively. "Every night the same, dhramed of an old shoe on the doorstep a-knockin'. '*One'll come for another*,' that's what that manes."

This called out a story from a woman two seats behind, giving rise to a discussion with a man who sat by the door. Then loyalty demanded that they speak again of Nora. "She had the noise of a cold when she wint away," William heard Annie's sweet querulous voice saying, "but we thought nothing of it." She repeated for the twentieth time the few facts known concerning Nora's illness and demise, winding up, as always, "It was very suddin; every one was *struck*."

Again the talk fell back from William's consciousness, elbowed out by the ever-recurring question, "What is Harold doing here?"

Why should he, with his slender means, take the unnecessary journey? why leave the lessons which had more than once kept him from writing home? Why, ah, why? There was only one answer.

How old was Harold when Nora first came to the house?—let us see—sixteen; Nora was two years older, and she stayed four years. That is the impressionable age, when life stirs in the veins and struggles for expression. If a boy is ever going to be romantic, it will be then. And Nora was pretty, she was very pretty.

William tried to remember how he felt when he was sixteen. There had not been much time for nonsense. There were too many chores to do on the farm, and when they were done he was tired enough to go to bed and to sleep. But how would it have been if he had only games for exercise and such stuff as they read in school to think about? The old classics—h-m, one long string of love stories! And it was pretty much the same with modern languages. William grew hot and cold as he recalled the various tales Harold had repeated to his father and mother, translating as he went. Dorothea certainly "worked out" for Hermann's mother.

"Lord have mercy upon us!" shrilled a clear, girlish treble from the inner room.

William jumped.

"Whisht!" whispered Mary over his shoulder. "'Tis the Litany for the Dead. That's Katie Kelly that sings at the church." Down she dropped on her knees and let the wave of prayer [illegible] over her.

"*Have mercy on the Soul* [illegible] *ful Departed!*"

Like the first voice, [illegible] clear voice rose [illegible] and led. With [illegible] the sound of

women's voices and the voices of men followed.

The Three Persons of the Godhead, the Sacred Trinity, she besought—

"*Give rest to the Souls of the Faithful Departed!*" chanted the kneeling men and women.

The Virgin Mary, Angels and Patriarchs, Prophets and Martyrs, she implored—"By her Grace, by their Glory, by all that had been suffered and by all that had been won"—

"*Pray for the Souls of the Faithful Departed!*" responded the women and men.

Back to the Throne rang the cry for mercy and deliverance.

"From the shades of death, from the torments of purgatory, for the welcome of angels, for the rejoicing of prophets, for the escort of martyrs unto seats of eternal glory where the whole Church Triumphant should celebrate the deliverance"—of the girl he would have recommended as a "first-rate cook and a fine laundress."

Why not? She was good and faithful and patient: were not these the main thing? Who should say the boy had not been wiser than his elders in seeing this? Ah, what was life anyway but the avenue to death? Had not these simple folk here solved the problem?

The wind was rising; it rocked the little house and wailed in the chimney; a gust of snow like a winding-sheet went by the window. Heads bent lower, voices grew more insistent, "*Give eternal rest to the Souls of the Faithful Departed!*" then ceased, and through the hush that followed rang the cry of Nellie mourning as only the Gaelic mourn, breaking their full hearts in libation to the dead. "*Ah, Nora, Nora, Nora!*"

William mopped his damp forehead with his handkerchief and nestled uneasily in his chair. Good heavens, how could the boy stand it! His own heart was rent and torn. He searched the corner where Harold sat, pulling away at his pipe again and receiving the pitcher as it passed, gravely, ceremoniously, as one performs a rite. The curling wreaths of smoke which rose around him were incense to that white-robed figure; every glass filled and lifted was a silent pledge to her.

The little kitchen had grown very still. For several minutes the silence lasted; then stories which are never told by day or when the heart is free were recited with impressive shrugs and glances, as who should say, "There may be no truth in it. I give it to you as it was given to me; nevertheless—"

"There are houses at the bottom of Kerry Lake," said Bridget Donohue, she who was known as "Red-headed Bridget" to distinguish her from some eight or ten others of the same name. "You can see 'em on a clare day."

"Did *you* ever see 'em?" inquired Tom McCarty, jocosely, and the ghost of a smile flitted over the faces of those near.

"But I know them that have," retorted Red-headed Bridget, and forthwith made a bolder bid for attention. "There's a priest buried under a church at home, and a girl who went early to mass heard him knockin' entirely," she announced.

"Did they dig him up?" questioned three or four at once.

"Naw," replied Bridget, nonchalantly; "there was no one else heard it. They said it was because slippers were buried wid him in the coffin. It's bad to do tha-at," she drawled. "Besides," she finished, "he was an old man and he had been buried four days," as if this demanded some concession on his part.

The appreciative murmur which followed, part amusement, part applause, encouraged another *raconteuse*. "There was a man who came back to marry a girl at home," began a familiar voice. It couldn't be, yes, it was, cold, indifferent Annie, flushed and stimulated into speech. "She met him an' it was avenin'. She said she was goin' to a dance, an' he wint along. An' there was crowds goin' along. An' he thought he saw folks that had died, but she told him it was somebody else. An' they danced an' danced. An' at midnight the hat was passed for the fiddler, but the young man didn't put in his coin; someway he felt as though he'd better not. An' all at once the girl was *gone*, an' all at once the *life wint out of his bones. An' thin he heard the sound of the Midnight Car—the Midnight Car of the Dead.*"

There was an impressive pause. Tom McCarty's hand trembled as he filled his glass. Who could be sure these stories were false when *that* was true, in there,

that silence and chill and emptiness? The cumulative effect of the long watch, the mourning, the prayer, the invoking of the supernatural, was upon each one. For William, clinging dizzily to his seat, it was Harold who had come back, and the dead girl was Nora, and Harold must not "pay the coin;" he must have no commerce with the wild, frenzied crew. William stood up unsteadily and sent a compelling glance towards Harold's corner. The young man turned as if a hand had been laid on his shoulder. William beckoned, but there was no need; Harold was already stepping over Mike as the latter leaned forward to address the man in front of him, and had elbowed a way between Bridget and Annie to gain his father's side. They were soon out in the cool air between the drifts, and quickly gained the street. Then a sudden constraint fell upon William. "I did not expect to see you here," he began awkardly as the two fell into step. Now that there was an opportunity to speak, he did not know what to say. Between them was a wide gulf made by the experiences of the son in which the father had no part.

"No more did I expect to see you," returned Harold, lightly. "I'm glad to be out of that room." There was nothing of the love-lorn youth in his tone or manner.

William's heart gave a great leap. "So am I," he exclaimed, taking his son's arm.

"It was abominably stuffy and hot," continued Harold, with a shrug.

"So it was," cried William. The gulf changed its position; it no longer separated them from each other, but stretched between their kind and what they had left.

"How did you happen to come up?" asked William, in a confidential tone almost not quite concealing his anxiety.

"That's a long story," returned the son, diffidently, and the father's heart sank again.

"I don't know but I shall have to tell you," began Harold, slowly; adding, after a pause, "I felt that I owed this much to Nora."

Again the chasm yawned at their feet, and across it the father leaned to lay a hand upon his boy. Owed it to Nora, indeed!

How like the young that was, forever subordinating the obligations they are born into to the obligations they themselves incur!

"Do you owe your mother and me nothing?" demanded William, in exasperation, stopping to face the lad. "What is this kitchen wench to you, anyway? You forget yourself, you forget your mother and me. What do you mean, sir, what do you mean?"

In the dark eyes that looked back at him, on a level with his own, were agitation and surprise, but no shame.

"Why, Father!" said their owner at last, "why, Father!" and, in spite of strenuous effort, William began to feel himself to be the culprit and this tall young fellow before him to be the judge. "I see I shall have to explain everything," said the boy, and, taking his father's arm with a conciliatory gesture, turned him gently about, and walked with him some paces before he spoke again.

"Do you remember telling me two years ago that you were perfectly willing to have me go to college if some one would advance me the money, but you had no more to spare? And you thought Aunt Martha came to the rescue? It was Nora. She heard us talking," pursued the young man. "She had just quarreled with Nellie, and had to adopt somebody." He paused, with a laugh. "I demurred, but she insisted. Of course I intended to pay her back. I shall pay Nellie and Mike now. I came up partly to talk it over with them, but they evidently know nothing about it, and they are so upset, perhaps it is just as well to wait until I have something. This last year I have taken care of myself, and shall the rest of the time. It was only the first year I had to have help. Do you care very much, Father?"

William was shaking from head to foot. The emotional strain he had been under, the torturing changes from faith to doubt and from doubt to faith, had left him unsteady in body and mind.

"You were all tied up that year," Harold went on, soothingly, "and as blue as you could be. You'd have told me to wait, and I felt that I'd better go right on. Of course I felt mean to take it from a servant"—the gulf yawned again, this time forever, but they were both on the hither

side and Nora was not with them—"especially as she would not take a note," he said, regretfully. "But there seemed no other way. I tried every one of your friends; they were all tied up just as you were." He ceased. They were at the home gate. "I won't go in," he said, hurriedly, "and I guess you'd better not say anything to Mother. But, Father, I want to tell you, now that I've begun, I'm getting along *fine*," and, standing there in the moonlight, with folded arms, erect and with his head thrown proudly back, he set forth his plans, talking rapidly and in a low voice, as man to man. William had never in his life admired anything half so much.

"Is it all right?" asked the boy finally, holding out his hand, and William clasped it eagerly.

"Yes, it's all right, all right," he said with fervor. He stood where Harold left him, until he had watched the slender, graceful figure out of sight, then turned with a sigh of absorbing satisfaction and mounted the steps to the house. "He's a good, hard-headed, sensible boy," he said with emotion. From the American of to-day there can come no higher praise.

In the hall he paused to turn up the gas and look at his watch. Horrors! half-past two! What would Fanny say? The bedroom door creaked perfidiously as he entered. "Is that you, William?" murmured the invalid, without opening her eyes. "Isn't it early for a fire?" She was still drowsy with the anodyne.

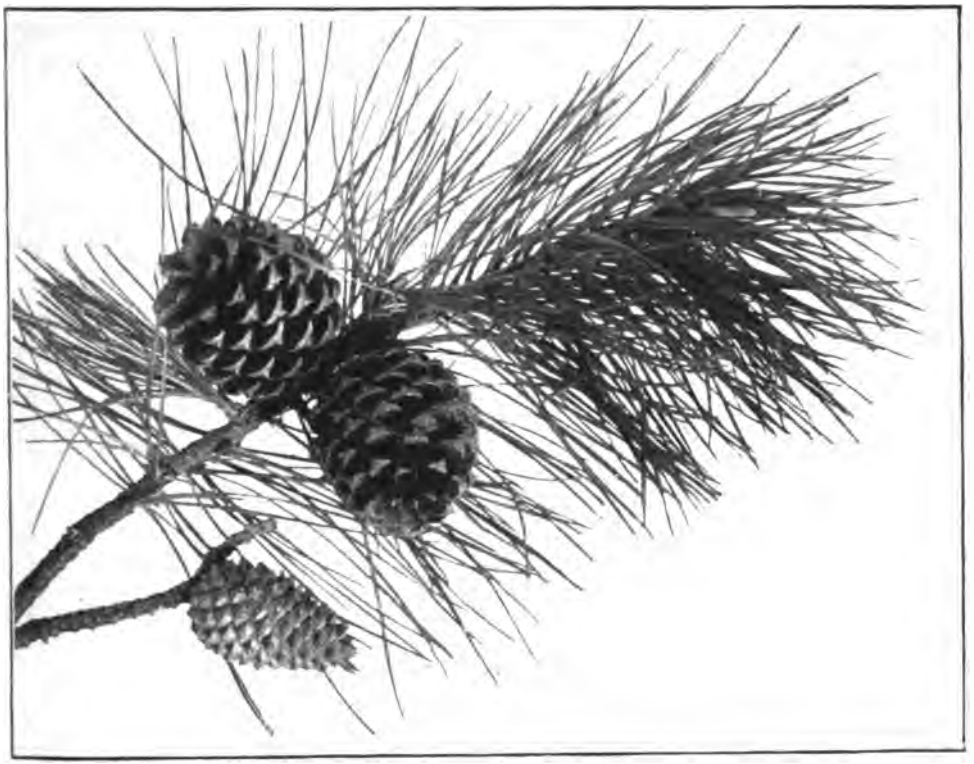
"Perhaps so," returned William, amiably, resolved to save his explanations until a time when they might be more needed. Cautiously he slid out of his clothes and into his place beside her, too full of the night's adventure for sleep, but glad to lie still and revolve again and again in his mind that last half-hour with Harold.

In an incredibly short time, as it seemed to him, the distant rattle of the kitchen range told him that Mary Sullivan had used the key in the area door which he had left with her, and kitchen fires and breakfasts were to be no more his concern.

All went smoothly until Saturday, and then Annie was again in her place. Sunday afternoon saw the usual "meeting of the clans" in the Edson kitchen.

"They're all there," said William as he returned from a tour of inspection: "Hivites and Hittites, and Perizzites and Jebusites, Sullivanites and McCartys, 'the people from Mesopotamia and from beyond Jordan,' but why is Annie in a bright blue gown, when the others are dressed in dark colors?"

"Don't you know?" returned Fanny. "They always 'carry a dead person's clothes to church,' and that fell to Annie."



"It was awfully good of her to come back so soon," vouchsafed William, who just then had a tender feeling for the race.

"I'll tell you *why*," rejoined Fanny, unsympathetically. "She *has to go to work*, and the rest of them, to pay for that *show* at Nora's funeral—white silk and bride's roses!" Fanny sniffed contemptuously.

"I told Annie," she continued, "I should have supposed Nora 'd have saved enough to bury herself, but it seems she hadn't. And they all knew it before they launched out in that extravagant fashion! Those 'livin'-out girls' are the silliest, most sentimental, most improvident—"

"Stop!" cried William, sternly. Should he tell her? She would not understand if he did. Somehow he could not bear to have the subject discussed as Fanny was bound to discuss it.

He abruptly left the room.

THE CONES OF THE PITCH PINE

THE PINES

By J. Horace McFarland

Illustrated with Photographs by the Author

IN popular estimation, the pines seem to belong to the North, not quite so exclusively as do the palms to the South. The ragged, picturesque old pines, spruces, and hemlocks of our remembrance carry with them the thought of great endurance, long life, and snowy forests. We think of them, too, as belonging to the mountains, not to the plains, as clothing steep slopes with their varied deep greens rather than as standing against the sky-line of the sea. Yet I venture to think that the most of us in the East see oftenest the pines peculiar to the lowlands, as we flit from city to city over the steel highways of travel, and have most to do, in an economical sense, with a pine that does not come north of the Carolinas—the yellow pine which furnishes our familiar house-flooring.

The pine family as we discuss it is not all pines, in exactitude—it includes many diverse trees that the botanist describes as conifers. These cone-bearing trees are nearly all evergreens—that is, the foliage persists the year round, instead of being deciduous, as the leaf-dropping maples, oaks, birches, and the like are scientifically designated. Historically the pines are of hoary age, for they are closely related to the growths that furnished the geologic coal measures stored up in the foundations of the earth for our use now. Economically, too, all the pine family together is of vast importance—"the most important order of forest trees in the economy of civilized man," says Dr. Fernow, for, as he adds, the cone-bearing trees "have furnished the bulk of the material of which our civilization is built." As usual, civ-

THE LONG-LEAVED PINES OF THE SOUTH

ilization has destroyed ruthlessly, thoughtlessly, almost viciously, in using this material, wherefore the devastation of the forests, moving them back from us farther and farther until in many regions they are but a thin fringe, has left most of us totally unfamiliar with these trees, of the utmost beauty as well as of the greatest value.

To know anything at all of the spruces, pines, and hemlocks is to love them for the refreshment there is in their living presence rather than to consider them merely for the timber value. But the point of view differs immensely with one's occupation. I remember one summer finding in the depths of an Allegheny forest a comparatively rare, and then new to me, native orchid, the round-leaved or orbicular habenaria. While I was gloating over it with my camera, a gray-haired nature-lover of the neighborhood joined me, and he, to my surprise, assisted in the gloating—he, too, loved the woods and the plants. Coming a little later to a group of magnificent hemlocks, with great clean, towering trunks reaching up a hundred feet through the soft maples and yellow birches and beeches which seemed dwarfed by these veterans, I exclaimed in admiration. "Yes," he said, "them's mighty fine hemlocks. I calc'late thet one to the left would bark near five dollars' wuth!" On the rare plant we joined in appreciation, but the hemlock was to the old lumberman but a source of tan-bark.

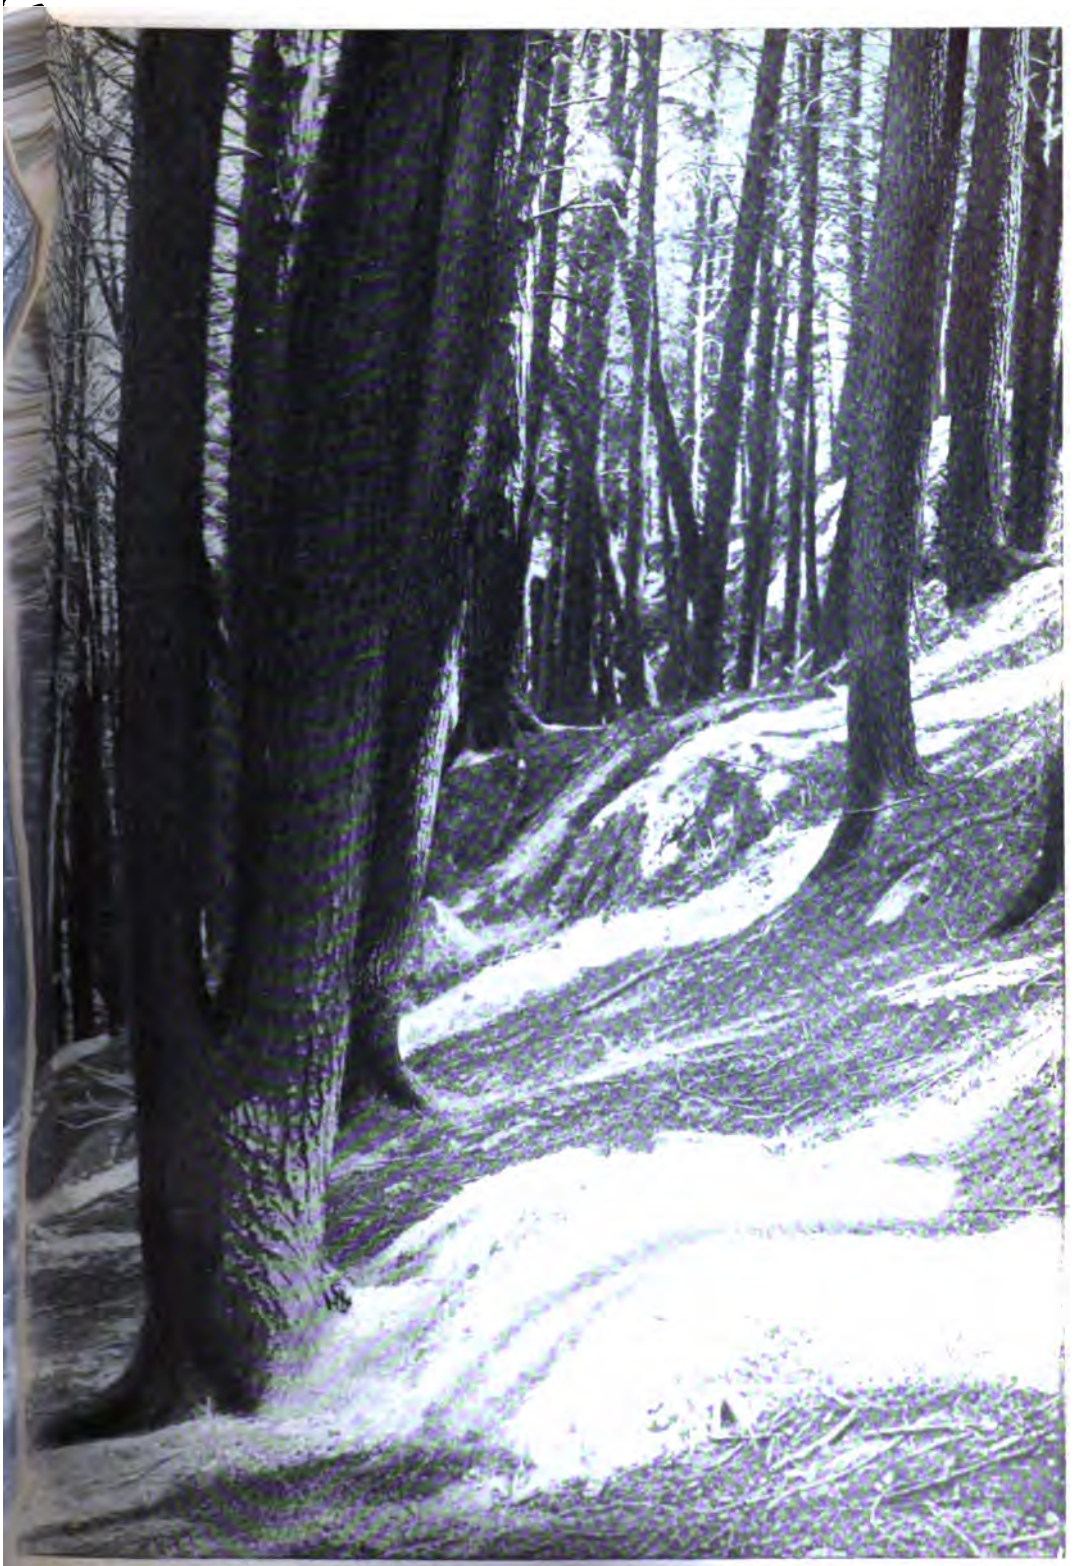
This search for tannin, by the way, is responsible for much wanton destruction. Young hemlocks, from four to six inches in diameter, are felled, stripped of their bark, and left cumbering the ground, to invite fire and to make of the woods an unkempt cemetery. The fall of a tree from natural causes is followed by the interesting and beauty-making process of its mossy decay and return to the forest floor, furnishing in the process nourishment for countless seedlings and plants. A tree felled in maturity under enlightened forest management is all removed for its timber, and leaves the ground clear; but the operations of the bark-hunter leave only hideous destruction and a "slash" that is most difficult to clear in later years.

This same hemlock makes a most impressive forest. To walk among primeval hemlocks brings healing to the mind, peace to the soul, as one realizes fully that "the groves were God's first temples," and that God is close to one in these beneficent solitudes, where petty things must fall away, vexations cease, and man's spiritual nature absorb the message of the forest.

I wonder how many of my readers realize that an exquisite bit of real hemlock forest lies not five miles from Boston Common? At the Arnold Arboretum, that noble collection of trees and plants, "Hemlock Hill," is assuming deeper majesty year after year as its trees gain age and size.

The pines themselves will well repay any investigation and appreciation. Seven species are with us in the New England and Middle Atlantic States, seven more are found South, while the great West, with its yet magnificent forests, has twenty-five pines of distinct character. The white pine is perhaps most familiar to us, because of its economic importance, and it is as well the tallest and most notable of all those we see in the East. From its first essay as a seedling, with its original cluster of five delicate blue-green leaflets, to its lusty youth, when it is spreading and broad, if given room to grow, it is a fine object, and I have had some thrills of joy at finding this splendid common thing planted in groups on the grounds of wealthy men, instead of some Japanese upstart with a name a yard long and a truly crooked Oriental disposition! In age the white pine dominates any landscape, wearing even the scars of its long battle with the elements with stately dignity. A noble pair of white pines on the shore of Lake Champlain I remember especially—they seemed to satisfy one utterly as they towered above all other trees. And a group of them that stood close to some only less picturesque red pines on the shores of a pond deep in the Adirondacks emphasized again for me the majesty of this beneficent friend of mankind.

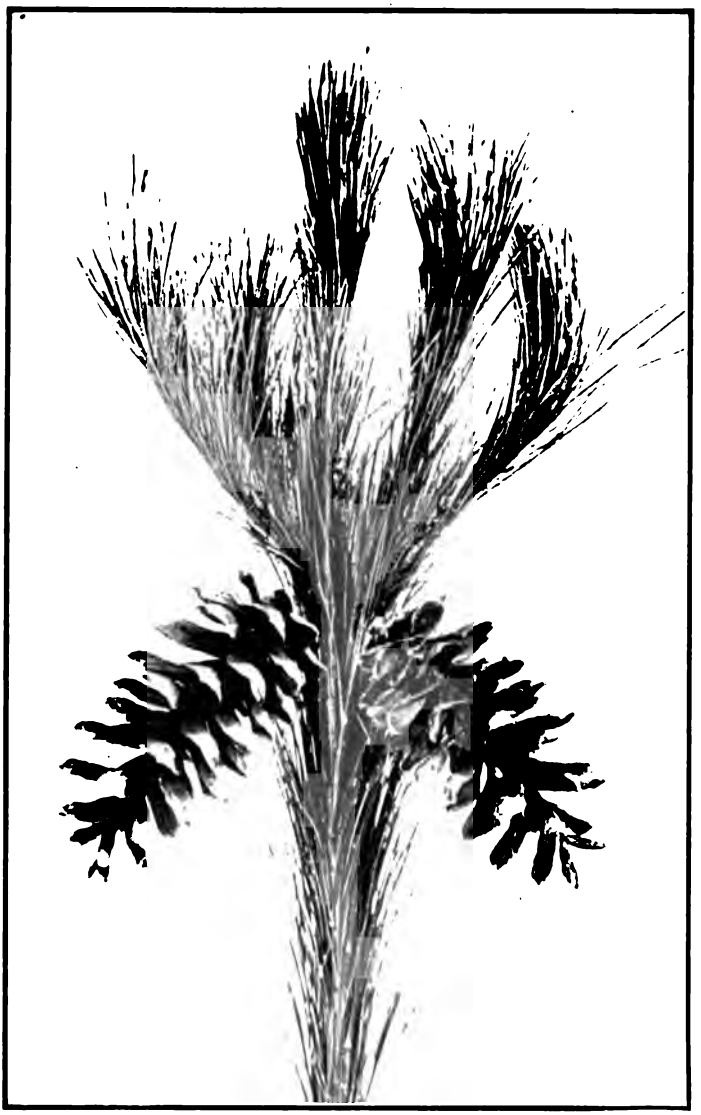
I am ashamed to say I have never seen the blossoms of the white pine, which the botanists tell us come in early spring, minute and light brown, to be followed by the six-inch-long cones which mature the second year. Next spring I hope to see these shy blossoms with my camera.



Any one who has traveled south of

CONES OF THE NORWAY SPRUCE

A HEMLOCK FOREST IN THE



ARNOLD ARBORETUM, NEAR BOSTON

of the Norway pine, which, among other species brought from Europe, is valued for ornament. The common jack pine of the Middle States hillsides wears symmetrical and handsome cones with dignity. Cones are, of course, the fruits or seed-holders of the pine, but the seeds themselves are found at the base of the scales or parts of the cones, attached in pairs. Each cone, like an apple, has in its care a number of seeds.

The nurserymen have imported many pines from Europe, which give pleasing variety to our ornamental plantings, and aid in enriching the winter coloring. The Austrian pine and the Scotch pine are welcome additions to our own pine family. In these days of economic chemistry and a deficient rag supply, every reader of these words is probably in close proximity to an important spruce product—paper. The manufacturers say they do not use much wood pulp, but when one has passed a great paper-mill flanked on all sides by piles of spruce logs, with no bales of rags in sight anywhere, he is tempted to think otherwise. Modern forestry is now planting trees on waste lands for the pulp "crop," and the common poplar is coming in to relieve the spruces.

Beautiful trees are these spruces and firs, either in the forest or when brought by the planter to his home grounds. The leaves are much shorter than those of most pines, and clothe the twigs closely. There is a vast variety in color, too, from the wonderful whitish or "glaucous" blue of the Colorado blue spruce, to the deep shining green of Nordmann's fir, a splendid introduction from the Caucasus. Look at them, glistening in the winter sun, or drooping with the clinging snow; walk in a spruce wood, inhaling the bracing balsamic fragrance which seems so kindly to the lungs; listen to the music of the wind in their tops, telling of health and purity, of God's love and provision for man's mind and heart, and you will begin to know the song of the firs.

A VARIETY OF THE NORWAY PINE

Sometimes the deepest, glossiest green of the spruce leaves as presented to the eye but hides the daintiest, white-lined interior surface of those same leaves. To the outside, a somber dignity, unassailable, untouched by frost or sun, protective, defenseful, as nature often appears to the careless observer; but inside is light, softly reflected, revealing unsuspected delicacies of structure and finish.

To us who are not woodsmen or "timber-cruisers" the most familiar of all the spruces is the introduced form from Norway. Its yellowish-green twigs are bright and cheerful, and in specimens that have reached the fruiting age, the crown of cones, high up in the tree, is an additional charm, for these soft brown "strobiles," as the botanist calls them, are smooth and regular, and very different from those of the rugged pines. I have often been told that the Norway spruce was short-lived, and that it became unkempt in age, but now that I have lived for ten years and more beside a noble specimen, I realize that the change from the upreaching push of youth to the semi-drooping sedateness of maturity is only a new dignity and beauty.

The balsam fir is almost indistinguishable from the Norway spruce when young, but soon grows apart from it in habit, and is hardly as desirable, even though a native. It is rich in the true balsamic odor.

The white cedar, our common juniper, with its aromatic blue berries or fruits, is perhaps the most familiar of all the native evergreens. Its lead-pencil sister, the red cedar, reaches our literary senses as closely as does the pulp-making spruce.

I might write much of the rare introduced cypresses from Japan and China, and of the peculiar variations that have been worked out by the nurserymen among the native pines and firs. Also, if I had but seen them, there would be much to say about the magnificent conifers of the great West, from the giant redwoods or sequoias of the Mariposa grove in California to the richly varied pines of the Rockies. But I can only suggest to my readers the intimate consideration of all this great pine family, so peculiarly valuable to mankind.

A DWARF FORM OF THE MOUNTAIN PINE

THE NEW AMERICAN NAVY

BY JOHN D. LONG

SECRETARY OF THE NAVY FROM 1897 TO 1902

THE ADMINISTRATION OF THE NAVY

GREAT results often overshadow and prevent due recognition of the merit and vital importance of the preparations which make possible their achievement. The navy, triumphant in battle, is a very different thing in the eye of an admiring country from the same navy preparing for the conflict. In one scene the actors are the picturesque and glorious fighters on deck; in the other, the bureau chief at his desk, the constructor in his shirt-sleeves, the forger of the great guns, the painstaking official providing his great coal-pits at easy reach. We laud the successful captains; too often we forget the men who made ready at their hands the material that made their victory sure. The names of Preble, Hull, Decatur, Porter, Farragut, and Dewey are resplendent names on the pages of our history, but who recalls or knows the names of the Congressmen who secured the authorization of the ships on board which these heroes won their way to immortality, or of the naval officials who designed and built and equipped them, and on whose shoulders the final responsibility for the conduct of vessels and crews in hostile operations largely rests?

The first war Secretary of the Navy was Benjamin Stoddert, of Maryland, who administered the service during the quasi-war with France. Robert Smith, of Maryland, sent to the Mediterranean the forces which humbled the Barbary States and enforced respect for American citizenship. Paul Hamilton, of South Carolina, and William Jones, of Pennsylvania, directed the fitting out and the despatch to what appeared certain defeat, but was in nearly all cases significant victory, of the ships of the second war with Great Britain. By his effective and excellent administration of the fleets of our Civil War, Gideon

Other papers will be: The Preparation for the War with Spain, The Battle of Manila Bay, The Blockade of Cuba, Bottling up Cervera's Fleet, The Battle of Santiago, Valiant Deeds in the War with Spain; Samoa, the Philippines, and China; Recent Naval Lessons.

DOCKING A BATTLE-SHIP

Welles earned the grateful appreciation of his country.

Too often forgotten are the men who in time of war are in subordinate departmental positions. The few clerks who faithfully carried out the instruction of Stoddart, Smith, Hamilton, and Jones, and undoubtedly did a large part of their work, are to-day unknown. The navy treasures the name of Gustavus V. Fox, the able assistant of Secretary Welles; but a small percentage of the present generation of the American people are aware of his faithfulness, his capacity, and the far-reaching results of the labor he performed. Entitled to special remembrance also are the Bureau Chiefs of the Civil War; but only the tons of musty records encumbering the files of the Navy Department tell of the way in which they fulfilled their duties. And, coming to the war with Spain, are not Theodore Roosevelt and Charles H. Allen, the Assistant Secretaries, and Arent S. Crowninshield, the Chief of the Bureau of Navigation, and Charles O'Neil, the Chief of Ordnance, and George W. Melville, the Engineer-in-Chief, and Philip Hichborn, the Chief Constructor, and Royal B. Bradford, the Chief of Equipment, and Edwin Stewart, the Paymaster-General, and William K. Van Reypen, the Surgeon-General, and Mordecai T. Endicott, the Chief of the Bureau of Yards and Docks, and Sam C. Lemly, the Judge Advocate General, and their subordinates, worthy of remembrance in connection with those who actually participated in battle? How promptly Congress rewarded Dewey and his captains! How quickly would there have been action in behalf of the Santiago officers had it not been for the unfortunate Sampson-Schley controversy! On the other hand, what indifference when it was urged that National acknowledgment be given to the officers who, though aware that only at sea could glory be won, placed duty above desire and patriotically remained at their desks, though at first some of them pleaded with tears in their eyes for service afloat!

The central function of the navy is the Navy Department at the National Capital. This is the organ which directs all members of the service, which is bound to detect any weakness in the navy system and replace it with new and healthier growth, and which centralizes all its forces for striking the sea power of an enemy. That navy is the most efficient and effective which, other things equal, is the most intelligently administered. The height naval education will reach depends upon the standard fixed for its attainment.

It is to the Navy Department, therefore, that the country looks for an efficient navy when means for the ships and men have been provided. And to the Department to-day I believe the country may so look with confidence. It is true that, like any other great institution in which the element of human nature is active, it still, to some extent, lacks cohesion and harmony, and in the transaction of business, even of routine character, there are now and then friction and wrangling in some details on the part of intelligent and able officials which would not be tolerated in a civilian establishment. The system, however, and not the men are at fault; indeed, in the main they work together with tremendous effect. Differences of opinion are better than lifelessness. Nor is it surprising that they should sometimes be accompanied by pettiness of personal feeling when one considers the way in which the departmental organization has grown, how necessity and expediency have developed it, and how intangible sometimes are the lines of demarcation between the authority and duties of the several bureaus.

The navy of the Revolution did effective work in that epochal struggle, but the credit for its achievements is little due to the several Boards and Committees which Congress appointed to create and administer it. In spite of the successes of the revolting colonies on the sea, especially of their persistent and lucky privateers, and the importance attached by Europe to our naval promise, the founders of our Federal Government thought the navy of so little consequence that the Secretary of War was charged by the first Congress under the Federal Constitution with supervision of naval affairs. Soon, however, unfamiliarity with the construction of vessels of war, and with naval business generally, led the war authorities to make the blunt confession that a separate department for the navy was absolutely essential, and an act, approved April 30, 1798, established the

Navy Department, the head of which was named the Secretary of the Navy and made a Cabinet officer, subordinate to whom were a principal clerk and such other clerks as he required. This organization carried the navy through the war with France, the war with the Barbary States, and the war with Great Britain. Defects, however, developed which demanded correction. A Secretary unprovided with expert professional assistance, and untrained in the technicalities of naval affairs, might have become at critical times a dangerous instead of a helpful factor in the service. "The multifarious concerns of the naval establishment," wrote Secretary Jones in 1814, "the absence of wholesome regulations in its civil administration, and the imperfect execution of duties due to want of profes sional experience, lead to confusion an abuses."

This plain statement convinced Cor gress that no further time was to be los in reorganizing the Department, and b an act, approved February 7, 1815, si weeks after the signature of the Treaty c Ghent, which closed the war with Grea Britain, a Board of Navy Commissioner was added to the Department. Thi Board consisted of three officers of th navy, of rank not below that of Post Cap tain; and the law required it, under th supervision of the Secretary, to discharg all the ministerial duties of the Depar ment relative to the procurement of nava stores and materials, and the constructior armament, equipment, and employmer

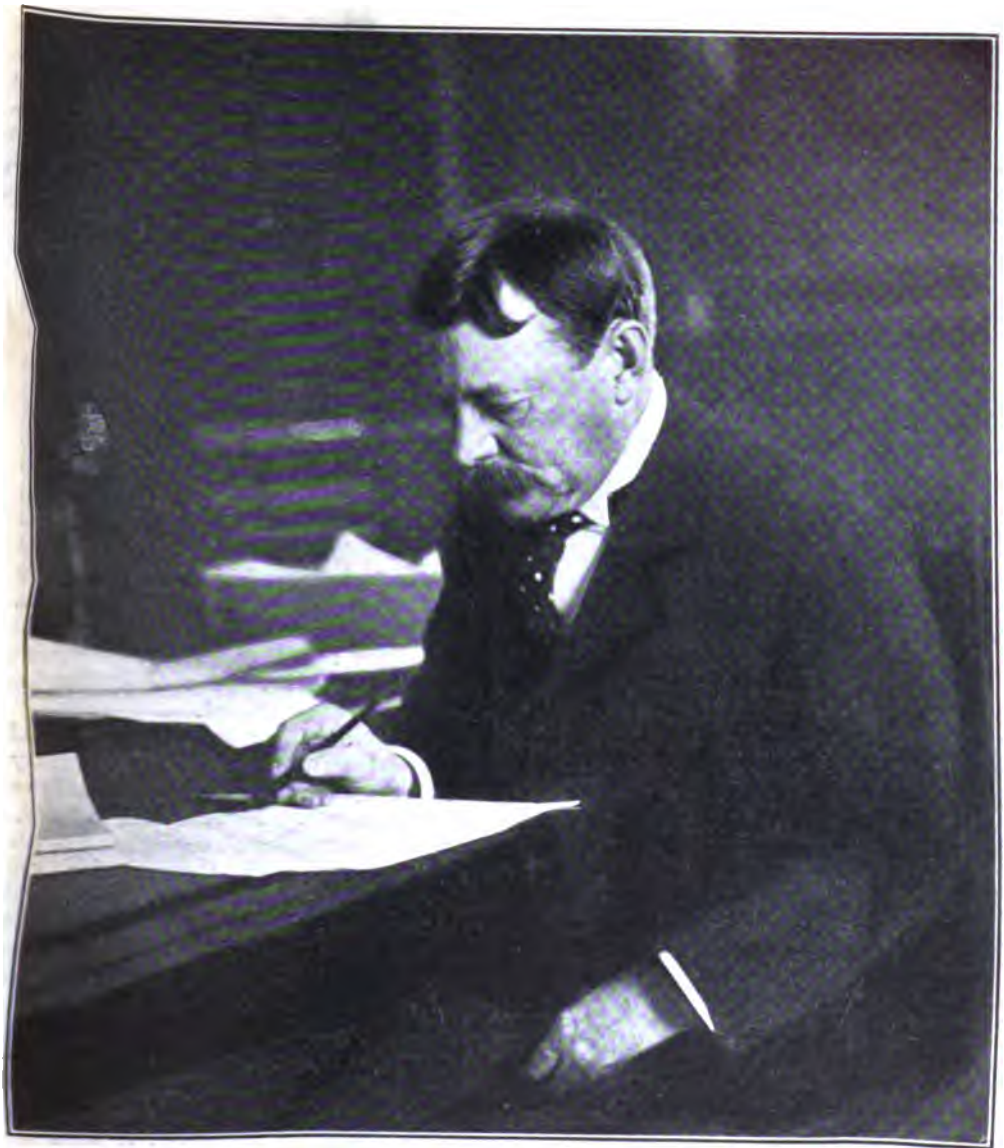
GIDEON WELLES
Secretary of the Navy during the Civil War
From a portrait that hangs in the Navy Department.

of vessels of war, as well as other matters connected with the naval establishment. It is true that this organization sometimes exemplified the truth of the old aphorism, "In divided power there is no individual responsibility." Also that the Navy Commissioners were usually men unfamiliar with the mechanical craft of ship-building, although by law given the right which they exercised to alter or reject plans of a projected ship which the constructors, subordinate to them, might submit. Also that the Constitution, the United States, and the Ohio, designed by Constructors Humphrey and Eckford, were the favorite and fastest ships of the navy in 1840, while those of later date, for which the Navy Commissioners were responsible, were clumsier and by no means the equal in speed of the fleet and graceful merchant ships laid down at American seaports. The Board, however, was progressive, notwithstanding its ignorance of the science of ship-designing, and was earnest to recognize and take advantage of improvements in the art of naval warfare. From 1815 to 1842, the lifetime of the Board, the navy increased many-fold, and Cooper thus testified to its efficiency: "As respects the navies of this hemisphere, it was (in 1845) supreme, the united marines of all the rest of the continent being unable to contend against it for an hour." Still, due in part to the fact that the law required the Board to act as a unit, and in part to other defects of the system, the abuses of which Secretary Jones complained continued to some extent either in the same or new forms under the Navy Commissioners, causing the celebrated Matthew Maury, then a young Ensign in the navy, to write this criticism:

"To what page soever I turn, I find my note-book filled with memoranda which exemplify the evils of the present system. However distinctly within the walls of the Navy Department usage may



have drawn the line of demarcation between the duties of Secretary and Navy Board, or however well it may be understood there, you will find but few able to trace it out of that building. Ask officers of the navy where the duties of the Navy Board begin? or where its responsibilities end? or where rests its accountability?—and no two will agree in their reply. Ask the best-informed citizens the same questions. Some will tell you that the Navy Board is a power behind the Secretary, greater than the Secretary himself—that there is a master spirit in that Board which rules the Navy. Others will tell you that the evil genius of the Navy presides at that Board. Him they unjustly charge with everything that goes amiss, and would hold responsible for the present condition of the navy."

All which even at the present day sounds rather familiar to anybody who is familiar with those criticisms of the Navy Department or any other department which are always in the air. "The evils of the present system" are always with us and always will be.

Congress, cognizant of imperfections in the departmental system, in 1839 called upon the Secretary of the Navy to suggest a plan of reorganization which should make a proper division of the duties performed by the Naval Commissioners. Disheartened by criticism and oppressed by the growing burdens which the increase of the navy and the new problems which developments in the science of naval warfare had laid on them, the Commissioners at last officially admitted that their usefulness had gone, and recommended the introduction of a system of bureaus practically identical with that which exists to-day, with the exception of the Bureau of Steam Engineering. Steam was then in its infancy, and was not considered sufficiently important to warrant supervision as a separate feature of the Naval Establishment. The Senate adopted the recommendation of the Commissioners, which contemplated the organization of seven bureaus, but the House reduced the number to five, and in this reduction the Senate concurred. The Bureaus created by the act of August 31, 1842, were Navy-Yards and Docks; Construction, Equipment, and Repairs; Provisions and Clothing; Ordnance and Hydrography; and Medicine and Surgery, the titles indicating the duties respectively assigned to each. A line officer of the rank of captain was made chief of each Bureau, with the exception of the two Bureaus of Provisions and Clothing, and Medicine and Surgery. In 1853 John Lenthal, a naval constructor, was appointed Chief of the Bureau of Construction, Equipment, and Repairs.

The bureau system did not escape criticism as sharp as that leveled at preceding organizations. The Civil War demonstrated elements of inadequacy, and Congress in 1862 added the Bureau of Steam Engineering, created the Bureau of Navigation, and took equipment from Equipment, Construction and Repairs, making it, with recruiting, a separate Bureau of Equipment and Recruiting. The Rebellion also brought into existence the office of Assistant Secretary of the Navy, which was authorized in 1861 and abolished in 1869. It was re-established in 1891 in accordance with the recommendations of the Secretaries who had engaged in developing the New Navy. Questions involving interpretation and application of the law constantly arising, and the need of an officer specially charged with the supervision of courts martial and also with the very important and growing matters of contracts of all kinds to which the Navy Department is a party, caused Congress in 1865 to direct the appointment of a "Solicitor and Naval Judge Advocate General." With some difficulty, Congress was induced, just before the construction of the New Navy, not to discontinue the office. It is to-day a very important branch of naval administration, especially in view of the dealings, involving many millions of outlay, of the Navy Department with contractors of all sorts.

Scandals and abuses had flourished as the old navy declined. Regeneration of material was accompanied by reform of administration. Secretary Chandler found serious lack of responsibility and co-ordination of work. To obtain greater efficiency, he recommended the appointment of three superintending naval constructors, who should have direct charge of all work relating to construction, steam-engineering, and equipment, under the supervision of a Chief of the "Bureau of Naval Construction." Secretary Whitney reported that large private purchases

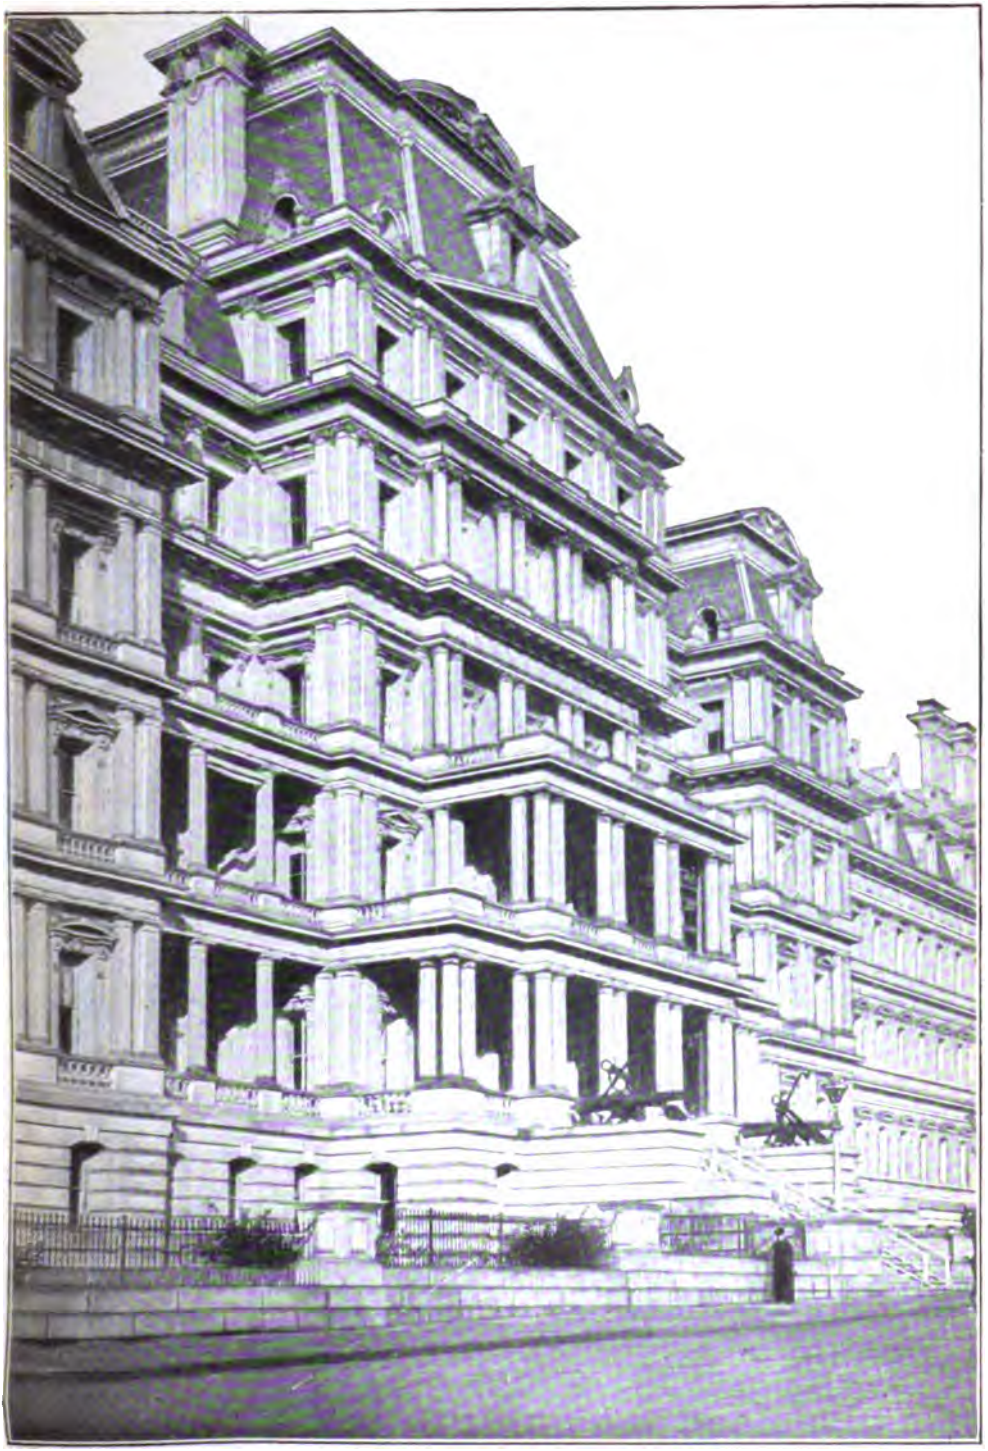
PHOTOGRAPHED FOR THE OUTLOOK BY HENRY HOYT MOORE

WILLIAM H. MOODY, SECRETARY OF THE NAVY

were made by the Bureau Chiefs where the law intended that contracts, after due public competition, should be awarded to the lowest bidder. Instead of being in the hands of regular dealers, much of the business of the navy was controlled by brokers. During the fiscal year ending June 30, 1885, seven bureaus, acting independently of one another, expended $138,000 for 166 several open purchases of coal, that is, without competition; eight bureaus made 299 open purchases of stationery; six bureaus bought lumber and hardware for which the Government paid $121,315 in 499 separate open purchases, and seven bureaus spent $46,000 for oils and paints in 269 separate purchases. Mr. Whitney found that eight bureaus supplied ships with stationery and three furnished lamps and lanterns.

As the law authorizing the departmental organization places the assignment of duties in the hands of the Secretary, Mr. Whitney directed comprehensive and wise reforms. He consolidated the business of conducting purchases in the

Bureau of Provisions and Clothing, and made the Paymaster-General responsible therefor. In order to check unnecessary accumulation of supplies and to reduce the expenditures for purchases made, the general-storekeeper system was created and the Bureau of Provisions and Clothing was charged with the keeping of property accounts. During the administration of Secretary Tracy the name of the Bureau of Provisions and Clothing was changed to Supplies and Accounts as more truthfully defining the duties it performs.



Secretary Tracy carried on the policy of reformation. When he assumed the naval portfolio, he found that "the details of administering the navy, as an existing force, its vessels in commission, its officers and its crews, were scattered, without system or coherence, among a variety of offices, bureaus, and boards." As illustrating the confusion which existed, the Secretary said in his report for 1889:

"The assignment of officers to duty, and, to a limited extent, the movements of ships in commission, were in charge of an 'office of detail,' at the head of which was the Chief of the Bureau of Navigation, which Bureau was, at the same time, supplying compasses, chronometers, and navigating instruments, electric-light plant, ships' libraries, and other miscellaneous articles. The enlistment and assignment of seamen belonged to Equipment, which was also engaged in the supply of another list of miscellaneous articles, and in the manufacture of cordage, galleys, chains, and anchors. The direction of gunnery practice by ships in commission was in charge of Ordnance, whose all-important duties in providing the navy with a modern armament left little opportunity for supervising the occupations of vessels at sea. The examination of those vessels on their return from a cruise was the duty of a Board of Inspection which was not associated with any Bureau. The training of officers and men was in part conducted independently by the Naval Academy, and in other parts assumed by Navigation, Equipment, and Ordnance. To all these fragments of authority there was no central unity of direction, except such as could be given by the personal attention of the Secretary to the exclusion of that broad and general supervision over all executive business which is required by a Department as comprehensive as the navy, and cases were not infrequent where a ship received simultaneous orders from three separate Bureaus which were so directly contradictory that it was impossible to execute them."

Eradication of the defects which Mr. Tracy discovered was one of the important works to which he devoted his attention. The administration and operation of the fleet, including movements of ships and training, assignment, enlistment, inspection, and practice of the personnel, were assigned to the Bureau of Navigation. The miscellaneous duties of navigation, which properly came within the sphere of equipment of ships, were transferred to Equipment, which lost recruiting. The hydrographic office was by law attached to the Bureau of Navigation. Secretary Tracy recommended that it be placed under the Bureau of Equipment, but it was not until 1898 that legislation directing this was enacted.

Another step in the reformation of naval administration was taken by Secretary Herbert, my predecessor at the head of the Navy Department. Mr. Herbert, in 1894, issued a general order charging the Bureau of Construction and Repair with the responsibility for the design, structural strength, and stability of vessels built for the navy. This order was important for the reason that it enabled the department to hold a single officer accountable for the success or failure of a ship.

Thus, examination of the history of the Navy Department in 1897 showed persistent effort to place the office upon a sound business footing; but it was also found that much remained to be done before a satisfactory organization would be in operation. Prior to the first inauguration of President McKinley, Congress had not provided for the improvement of the navy-yards with the proportionate liberality which their importance to the steel fleet demanded. The demand for navy-yard reorganization at the time of the birth of the new navy was so insistent that Congress, in 1882, directed the appointment of a Commission to make a thorough investigation. This Commission then advised a reorganization and concentration of the mechanical departments

RECORD-ROOM OF THE BUREAU OF CONSTRUCTION AND REPAIR, NAVY DEPARTMENT WASHINGTON

of the yards at New York, Norfolk, and Mare Island, the closing of the New London and Pensacola yards, the temporary shutting down of the League Island yard, and the retention of the Washington yard for the manufacture of standard articles, but not as a ship-yard for the repair of vessels. Difference of opinion existed as to what should be done with the Boston and Portsmouth yards. The Secretary designated the Washington yard as the place where all ordnance work should be centered, directed that most of the construction and repairs of ships should be effected at the New York, Norfolk, and Mare Island yards, and ordered that equipment work should be done at the Boston yard. The steady growth of the navy and the size it had attained in 1897 convinced me that the time had come to enlarge the capacity of existing yards and to equip others to do repair work. During my administration the yard at Port Royal, S. C., was the only yard abandoned, but in its place Congress authorized the establishment of an important naval station at Charleston, in the same State.

A step toward the effective reconstruction of the yards was the appointment of a competent chief of the Bureau of Yards

and Docks. From the time of its creation this office had been held by officers of the line who possessed little expert knowledge in civil engineering. Knowledge of this science is essential for the proper planning of naval stations, the construction of dry docks, and erection of buildings. A vacancy occurring, the President, upon my recommendation, appointed as Chief of that Bureau for the term of four years—the period fixed by law—Civil Engineer Mordecai T. Endicott, an officer of distinction in his profession and for a long time on duty in that Bureau, who had theretofore given evidence of efficiency and skill. Congress, at last satisfied that an effective fleet must have bases, and be equipped with appliances for prompt repairs, authorized extensive navy-yard improvements. Five years ago the docking facilities of the country were totally inadequate for the needs of the *matériel*. There were but three docks capable of receiving battle-ships—one at New York, known as Dock No. 3, a timber structure, which was defective on account of both location and workmanship; one at Port Royal, built of timber, the cross-section of which was too small to permit the entrance of a battle-ship fitted with bilge-keels, and which could be approached only at high tide; and the third, also timber-built, at Bremerton, Washington, which was the best of its size belonging to the Government, but which had the disadvantage of being within striking distance of the British naval station at Esquimault. The prospect of war with Spain and the need of a dock on the Atlantic coast available for battle-ships in case of injury caused the Department to take measures for putting Dock No. 3, at New York, in condition for service, and it has since been practically in continuous service. A significant indication of our lack of sufficient docks was furnished in 1897 by the mortifying necessity of sending the battle-ship Indiana to Halifax to have her bottom scraped and cleaned.

A board of officers was appointed in 1897 to consider the docking requirements of the navy, and in the light of its report the Department recommended the construction of stone and concrete docks at Boston, Portsmouth, N. H., and Mare Island, a steel floating dock at Algiers, La.,

PHOTOGRAPH BY HENRY HOYT MOORE

MAIN DRAUGHTING-ROOM OF THE NAVY DEPARTMENT, WASHINGTON

and the enlargement of docks at New York, League Island, and Norfolk. Congress investigated the relative merits of timber and stone and concrete docks, and in 1898 provided for four timber docks and one steel floating dock; but authority was afterwards given to the Department to build these four docks of the more solid material. The construction of these docks of masonry has definitely committed the Government to this type, the advantages of which are greater safety, longer life, and less repairs. Though these docks, which are now nearing completion, were at the time of their design the largest ever built by the United States, three others, also of stone and concrete, which Congress subsequently authorized, will be even deeper and wider, accommodating any of the immense battle-ships which are under construction and contemplated. The floating dock for Algiers is in successful operation at the naval station at that point. During the five years of my term Congress authorized the construction of seven masonry docks, one steel floating dock, and the rebuilding of one timber dock in concrete. In addition, the Department purchased for the small sum of $250,000 the practically new steel floating dock at Havana, which had cost Spain $600,000. In 1897 there were eleven Government docks, only three of which could accommodate battle-ships of the first class. There are to-day, built or under construction, twenty-one Government docks, eight of which are designed to receive the largest ships and three others ships of 10,000 tons displacement. Even with this number, we are far behind the maritime nations of Europe. In the single yard at Portsmouth, England, there are more dry-docks than we have to-day in our whole service. Germany, whose navy is about the same strength as our own, has seventy docks, two of which belong to private companies and are capable of receiving any of the Kaiser's battle-ships.

Besides providing docking facilities, Congress also authorized improvements in navy-yard plants. The navy-yard at New York is now equipped to construct battle-ships. That at Portsmouth, with an additional appropriation of $175,000, and the yards at Norfolk and Mare Island, with an additional appropriation of $225,000, can be made ready for building vessels of this type. The improvements under way at Boston will, within two years, fit that yard for this work. The yards are to-day in condition to make repairs promptly, efficiently, and economically. The country should not think, however, that their improvement ought to cease. Much must be done to keep them in a state of efficiency. The coaling facilities of the country have also largely increased since 1897. A man-of-war leaving San Francisco for China or Australia will now find coal piles distributed at convenient points along her route. Coal is the food of a modern ship, and war will demonstrate the strategical importance of the stations established, just as peace has shown their economic value. In addition to coaling depots, the United States owns twenty-three navy-yards and naval stations, the total value of which is not far from $100,000,000.

The shore stations of the navy have been described at some length because knowledge of their condition is necessary to obtain an adequate idea of the responsibility which rests upon the shoulders of those who administer their affairs. The several Bureaus, which have departments at the various yards and stations, are tenacious of their prerogatives and guard them jealously, fearing, perhaps, that any innovation will be followed by diminution of their jurisdiction. The temptation to step beyond the limits of a Bureau's authority as fixed by the Naval Regulations sometimes proves almost irresistible. The Bureau affected sharply resents the encroachment, and there immediately follows an exchange of communications, sometimes highly seasoned. The controversy is ultimately loaded upon the Secretary, who is expected to untangle the snarl in which his subordinates have wound themselves. The relations between the Bureaus are occasionally so strained that ordinary courtesy is strained. I recall that one Bureau Chief became highly incensed at another because of the latter's recommendations in connection with changes in the machinery of a cruiser. "Your recommendations," wrote the former, "are as inconsistent with your ignoring of the suggestion to withdraw the same as is your assumption of a 'best way to handle' these surveys antagonistic to simple

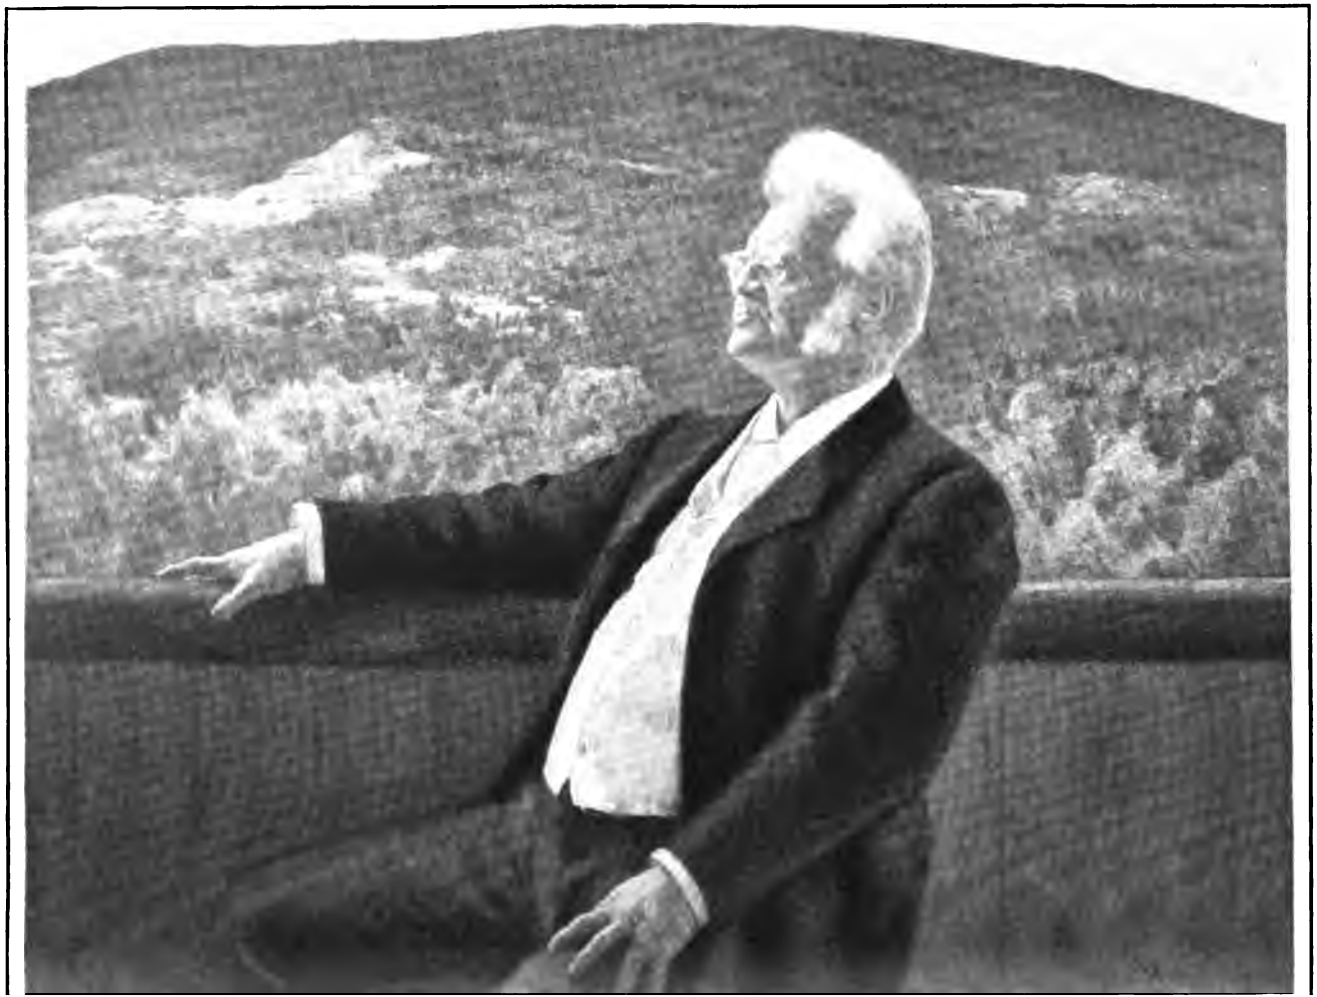
PHOTOGRAPH BY HENRY HOYT MOORE

SECRETARY MOODY IN HIS OFFICE AT THE NAVY DEPARTMENT, STUDYING THE MAP OF VENEZUELA

Bureau duties. The ostentatious display of a banner marked 'despatch' may obtain the confidence of the unversed, but it is not the proof of ability to secure that desideratum which is required to satisfy expert criticism."

This is one of the many instances of the friction which sometimes exists, but which should by no means be regarded as the rule. There has at times been like lack of harmony between other Bureaus. The cause of the trouble any one who investigates the matter will readily appreciate. Here are three or four Bureaus charged with the construction and fitting out of vessels, and while one, for example, is held responsible for the care and repair of all auxiliary steam machinery, it has no voice either in the design or installation of many of the auxiliaries. It

frequently has happened that one Bureau has brought its work to a point where, under the regulations, it would be taken over by another Bureau, but the latter was not ready for it. Each Bureau has a separate force of inspectors and corps of officers. As a ship is an integral work, it is evident that efficiency and economy could better be obtained by placing its construction, as far as possible, under one head. The construction and equipment of ships would thus be conducted under the system which is successfully employed in the private ship-yards of the country. Leading up to this step, the Department began in 1897 the substitution of electrical for steam power at navy-yards. Investigation had disclosed the astonishing fact that the power for operating the machinery of the different departments of the yards, instead of being supplied by a single plant, was furnished by boilers and engines scattered about the yard and operated by different Bureaus. Of course separate gangs of men were required for each plant, and the amount of power obtained was relatively small for the coal used and the steam consumed. Rectification of this extravagance was partially effected by concentration under the authority vested in the Secretary of the Navy. Legislation was, however, necessary before consolidation of the Bureaus could be made. The Bureaus of Construction and Repair, of Steam Engineering and of Equipment, both as a matter of economy and efficiency, should be under one head. Congress failed to adopt the recommendation to this end, just as it had neglected to act favorably upon recommendations contemplating somewhat the same result submitted by Secretaries Chandler and Whitney. This change must occur, and with it will come a sound business system which will introduce cohesion and unity in naval administration. The Hydrographic Office and the Naval Observatory should be placed directly under the Secretary of the Navy. The Observatory is decidedly behind institutions of like character in the United States and Europe. It always had as its superintendent a line officer, who sometimes possessed thorough and sometimes merely superficial knowledge of astronomy. The condition of the Observatory for two or three years past has been brought to the attention of Congress, which directed the appointment of a Board of Visitors, whose criticisms have already brought improvement in the work of the institution. It was urgently recommended that legislation be enacted removing all limitations from the field from which the selection of a superintendent may be made. The country is entitled to its best astronomer for this great astronomical plant. This recommendation, however, provoked strong opposition from some officers in the navy and their friends in Congress, which took the opposite direction, and even directed that the superintendent should be, "until further legislation," a line officer not below the rank of captain, thus limiting the place to a favored few and ignoring entirely the question of their capacity to fill it. The phrase, "until further legislation," gives some hope that Congress may later take more reasonable action with respect to the Observatory. Good management and results commensurate with the expenditures made demand a competent head, and the agitation which has been begun by the scientific bodies of the country should eventually bring about the organization of a personnel which will make the institution the equal of any in the world; indeed, with its larger expenditures, it should be superior.



From the time the construction of the old navy began, every Secretary of the Navy has felt the need of professional assistance. This want produced the Board of Navy Commissioners and then the Bureau System of the Department. But the Bureaus, working independently of one another and not always in harmony, so appropriated the space of a ship as often to leave her defective in some important particular. This unfortunate state of affairs was partially remedied by Secretary Tracy, who in 1889 constituted a Board, called the Board on Construction, consisting of the Chiefs of the five Bureaus of Yards and Docks, Ordnance, Equipment, Construction and Repairs, and Steam Engineering, to which he gave general supervision over the design, construction, and equipment of ships. As the work of the Bureau of Yards and Docks was confined to shore stations, and as a civil engineer had been placed at the head of this Bureau, it was withdrawn from representation on the Board and the Naval Intelligence officer substituted.

The Board deserves great credit for the work it has done, especially under the presidency of Rear-Admiral O'Neil, whose tact and judgment, in many controversial questions, have facilitated the submission of the intelligent recommendations of the Board to the Department. To it are referred questions of general construction, differences of opinion between Bureaus, and especially the plans and specifications for new ships.

Beyond the Secretary of the Navy and the Chief of the Bureau of Navigation there was, till recently, no well-organized system for the intelligent direction of the fleet after its construction and commission. The experience of the war with Spain showed the need of a General Staff. The office of Naval Intelligence and the Naval War College, both of which owe their creation to Secretary Chandler, were the first stage in the formation of the General Staff; but they were not adapted to comprehensive supervision of the training and the operation of the navy in war. When the Carnegie Steel Company was first established, only a few officers were required for the administration of its affairs; but when its interests became large, a Board of Directors was necessary successfully to conduct its business. The General Staff of the navy approximates the Board of Directors of a manufacturing concern. Its duties include the collection of information respecting foreign navies, their bases in time of war, and the theater of action in which they will move. This information will permit an appreciation of the aims and purposes of those navies, and a comparison of their strength with that which we will be able to muster against each or several of them. Based upon it, comprehensive plans can be prepared for the most effective operations by our navy and the utilization of auxiliary forces such as the naval militia and reserves, and co-operation with the army. The formulation of these plans and their execution in time of peace under the simulated conditions of war will train officers and men and prepare them to grapple with hostile situations when they arise.

After the war with Spain, Captain H. C. Taylor, now Chief of the Bureau of Navigation, who had given long and diligent study to the plan, and is to be credited with its adoption, submitted to me a memorandum on a General Staff for the navy. This memorandum pointed out the value and purpose of the General Staff, much as stated above. The navy was not quite ready for such a comprehensive change as would occur in case of the adoption of the full General Staff system, though it had been a subject of discussion for many years. The Department did not see its way clear to go further than to organize what is designated as the General Board, with the Admiral of the Navy as its President. This Board meets once a month, and at stated periods consults with the Commander-in-Chief of the North Atlantic Squadron, which practices the war plans which the Board devises. Its work gives promise of the excellent results anticipated. Germany employed fifty years in developing her General Staff, which gave to the world a marvelous lesson in organization and efficiency during the Franco-Prussian war of 1870. Necessary as such an organization is to the American navy, the steps taken to introduce it will be approved by experience.

In the navy a system of administration so compact and yet elastic that jealousies and friction will be minimized and the most effective co-operation obtained is always the desideratum. What the navy has accomplished must be attributed in large measure to the strength and character of its administrative and fighting officers. They have done splendid work, and they will do better yet. They are zealous, full of ability, honesty, force, and full, of course, of human nature. With these qualities the naval administrative organization is tending still more, as fast as it can, towards a system which will harmoniously labor for only one aim and purpose—the honor and safety of the country.

Björnstjerne Björnson

IF a consensus of literary opinion could be taken to-day, it would probably be found that Tolstoï, Ibsen, and Björnson would be given the foremost places in contemporary literature. The authors of "Anna Karénina," "The Pretenders," and "Arne" are not only writers of great force, but they are also striking personalities, from every point of view among the most interesting men of their time. Tolstoï is probably, all things considered, the foremost man in Europe; a writer of genius who has combined original power of a very high and sustained kind with the delicacy, the sensitive imagination, the plastic force of the artist, a passionate lover of his kind, one who looks at life sadly but with individual passion, a great artist turned reformer, without official position, excommunicated from the National Church and yet to-day the most influential person in Russia.

Ibsen has been for many years a voluntary exile from his country, a recluse in his habits, detached and solitary, although not without many friends and not lacking many agreeable qualities as a companion. He is a man who has endeavored to look life in the face and has found it, in his judgment, base and unworthy, and who has devoted himself with untiring energy and almost brutal frankness to the exposition of what he regards as the hypocrisy, the pretensions, and the benumbing conventionalities of contemporary life.

Björnson is the most wholesome of the three; a man of powerful frame, of overflowing physical life, of intense energy of mind, will, and feeling. He is a dynamic worker in every department of life, a born lover of life, a writer who has studied his kind at close range, who is in revolt against many traditions and conventions, but who believes in life, in his fellows, in the possibilities of human nature; a great, sunny, exuberant, boyish leader.

Björnson was born seventy years ago last December in Oesterdalen, in one of the bleakest and barest sections of Norway, surrounded by lofty, snow-covered hills. Although the son of a pastor, the future novelist, who was to picture the rustic life of Norway with such idyllic simplicity and with such sympathetic insight, was a boy of the people, who knew and loved the lonely life of the valley and the beauty of the mountain and fjord from his infancy.

At the age of twelve Björnson was sent to a Latin School, where he seems to have spent his energy in instinctive and persistent revolt against rules, regulations, and regular study hours of all kinds, but where he also became a leader, organizing a debating society, founding a newspaper, and showing in the vital life of the school all the energy he failed to display in his studies. In 1852 he was admitted to the Christiania University, where he made the acquaintance of Ibsen, and the two men became fast friends. At the university as in school, Björnson neglected the regular work, but was intensely active in all the fields that interested him. Here the idea of creating a national literature, free from Danish influence, took deep hold upon him; and with a little group of young men of kindred spirit and attitude he became an ardent advocate of Norwegian independence. In 1857 he went to Copenhagen; and in that city his first novel, "Synnove Solbakken," appeared, and at once made Norway aware that a new writer had appeared among them, who had brought a new strain into their literature. Simple in plot, direct and sinewy in style, dealing at first hand with the rustic life of Norway, the new novel came like a breath of fresh air. It was the beginning of a new movement. In the same class belong "Arne" and "A Happy Boy." Björnson's interest in the drama dates from an early period. He has acted as director of Ole Bull's theater in Bergen, where he published his first dramatic works, and of the Christiania theater. He has been the editor of various journals. He has written charming lyric poetry; and in prose, verse, and plays he has always spoken of real things in a real way. He has not only been a leader in the movement for intellectual independence, and for the development of a native literature to which he has also been one of the chief contributors, but he has carried into public life the same energy and freedom, and for many years has been one of the leaders of the progressive movement in Norway.

GOING TO TOWN

The People of New Mexico

By Morris P. Watson

THE saving grace of the Republic has been its power of assimilation. Out of a conglomerate mass from all nations it has made its citizens. A generation from the fatherland and they are thorough Americans. Not so with the Mexicans. For half a century they have been Americans, but to-day they are well-nigh as alien as when we acquired them. The slowness and dullness of the race accounts for this in part, yet it is only fair to allow for the difference in the method of acquisition. They came to us not by choice but by force; they were not transplanted, but left on the same old soil in the same surroundings; they were not thrown with English-speaking people, but remained with users of their mother tongue. To some extent the blame is ours, for we have known and cared as little for them as they have for us. It is only with their demand for Statehood that eyes have been turned upon our Mexican brothers of the Southwest.

That they are Spanish in tongue and customs is well known, but how tenaciously they have held to their race peculiarities is known only by those who have lived among them. Get away from the cities and the railroads and one would have difficulty in determining whether he was in New Mexico or our sister republic to the south. After hours of futile effort to find some one who would meet his English question with a more intelligible answer than "No sabe," he would probably be inclined to think that he had by chance crossed over the border of the United States into Mexico.

Through the veins of many of the natives of the Southwest flows the best of Spanish blood. Had their family records been kept, many could trace their descent from the daring Espejo and his party which pushed north as far as the city of Santa Fé in 1582. Yet they have so degenerated and mingled with the Indian tribes that they do little credit to their intrepid ancestors. There is no higher compliment than to call a native of the Southwest a Spaniard. The rich and educated insist upon being so called, the remainder being Mexicans or, somewhat contemptuously, "greasers." The greaser is the interesting, picturesque fellow.

The most fruitful region in interesting types is the Rio Grande valley. There they are more Americanized than back on

the mesas and in the mountains—the cattle and sheep country where the out-of-doors, nomadic life adds a wild, savage turn to the already evil-looking fellow—but they are still far removed from the commonplace. One spring day, the same on which most of the photographs illustrating this article were taken, I started south from Albuquerque along the Rio Grande. The river was swollen to a wide, muddy stream, the *acequias* were running bank full, and the fields were flooded with water. The budding trees were alive with birds, all the various members of the blackbird family, even to the beautiful yellow-neck fellow, singing in grand concert. Fence-post after fence-post was glorified as the seat of the prince of warblers—the meadow-lark. The robins, not yet gone north, dug in the soft earth for the fat angleworms, and chirped and chuckled at each new find. This irrigated valley is a garden spot.

Now and then we passed a ranch-house built of adobe, in that style which has ever proven effective for defense, the house opening only on an inclosed court formed by a high wall, the barn, and other outbuildings. All who enter pass through one massive gate into the court, and here, in grand confusion, live the Mexicans, with their horses, cattle, chickens, hogs, and dogs. Every two or three miles the houses get closer together, clustering around a little adobe church with its painted wooden cross and heavy bell ornamenting the plain exterior. These little towns take the name of the church, and it would be difficult to tell where one begins and the other ends.

COPYRIGHT, 1901, BY D. T. DUCKWALL, JR.

AN OLD CITIZEN OF NEW MEXICO

As we neared a church we heard the bell tolling, and, rounding a corner, we saw a small company coming down the dusty road. Bareheaded men walked ahead, six bearing a coffin, while behind trailed fifty or more women, each with a black shawl over her head, and all wailing and moaning. They passed into the little church, dimly lighted by a few candles, and there chanted, without a priest, the most dismal of funeral ceremonies. As the body was borne to the grave in the churchyard the women remained inside, seemingly vying with one another in vocal powers as they wailed and moaned. It was all very depressing until of a sudden they broke up into little groups and went off chatting, laughing, and smoking cigarettes. It made me think of the hired mourners of China. At another little town we were surprised to see a woman kneeling in the road, and in front of houses near by were others in the same devout attitude. The explanation was forthcoming when a procession headed by a priest in his robes and followed by girls in white came into view. The devout always kneel at the approach of a priest. The procession went to the house of a sick man, and the girls in white had just taken their first communion. These people are deeply religious, but seldom moral, and are completely under the power of the

BAKING DAY AT A NEW MEXICO HOME

Roman Church. There are some problems in the Southwest akin to those which face us in the Philippines and not unlike those with which President Diaz has dealt so summarily in Mexico.

An Indian pueblo which we passed through further on differed but little from the Mexican towns—a little more compactly built, that was all.

By evening we had reached the home of a friend, Abel Apodacca, and drove through the big gate into the court. Here we unharnessed our horses, watered them at the old-fashioned well, and, throwing the feed on the ground, turned them loose. Baking was in progress in the beehive-like oven in the courtyard, the progress of which we watched with interest. Fire having been kept in it for hours, the coals and ashes were raked out and bread and meat put in. These ovens do the best of baking. Abel is quite American, and we were not surprised on entering his house (the walls of which were of adobe nearly two feet thick, the floor and roof of the same useful material, in the first case tramped as hard as rock, in the latter spread thick on poles and baked hard by rain and sun) to find a trunk, an iron bed, and a cook-stove. None, however, were used for their intended purposes. The bed was an ornament used only by visitors who did not know better, the trunk had a few precious things in it, and the stove was a cupboard, a fire never having been lighted in it. By an open fire Mrs. Apodacca cooked our supper, which we ate sitting crosslegged on the floor, the dishes set upon a sheepskin which at night was part of some one's bed. We ate from common dishes without knives or forks, dipping out the *frijoles* (beans), *chille con carne* (chunks of meat swimming in the quintessence of red pepper), with pieces of *tortilla* (pancake). We drank our coffee, which was strong and vile, from a gourd. Being wise in matters of Mexican houses, we made our bed in the open court.

The men of this race are seldom handsome, nor the women pretty. The handsome, dashing cavalier and the beautiful señorita with whom the fictionist has peopled the Southwest land are more romantic than real. The people are small, dark, swarthy, unusually dirty, and meanly clad. The women wear black shawls over their heads, thinking thus to look like the Mother Mary, but they delight in bright

colors and often indulge in them to the total disregard of harmony. They invariably smoke cigarettes, men and women sitting idly in the sun for hours smoking and chatting.

Until recently the children were taught in Spanish, and even now there are many private schools in which Spanish is used. The church schools as well as the public schools are now teaching in English, but the teachers oftentimes have a better knowledge of Spanish than of English, and little real headway is made against the mother tongue. Upon visiting a school in charge of two Sisters, they had the twenty children sing for me:

"Good-morning, gentle sunshine,
What made you come so soon?
You drove the little stars away,
And scared away the moon."

They sang without expression or tune, and a Latin verse would have been as intelligible to them and as easily learned. Some of the Protestant churches have established missions and schools in which commendable work is being done.

Most impartial people who have become acquainted with the people and affairs of New Mexico feel that it would be a mistake to grant the Territory Statehood. The people spring from a stock which has ever shown itself incapable of self-government, and they have improved very little since they became Americans. They are led by dishonest and unscrupulous men, neither demanding nor expecting honesty in office. In one county in New Mexico the sheriff, without other income than his office, openly spends two or three times his lawful salary. He only makes a pretense of turning in fees; but the majority of the Mexicans vote for him and his gang because he is lavish to them with his, or rather the county's, money. In another county there is not one cent of the public money turned into the treasury, but the dishonest officeholders are continued in office. The people care little for Statehood, being influenced by the political office-seekers and large property-owners.

I have often been asked whether these people are at heart loyal citizens of the United States, and in turn I have many times asked the question. It is too sweeping to answer directly; but there is no doubt that, in case of war between the United States and Mexico, a large portion of the uneducated non-English-speaking population would sympathize with, if not openly aid, the enemy. Few speak English or want to learn. American customs and the spirit of progress do not appeal to them. Now and then you find a spark of it, and it gives you joy. One night I stopped at a hut in the mountains. The two boys of the family had been to the Presbyterian mission school in Albuquerque, and spoke fairly well. Finding in the house a little United States flag which they had brought home, I pointed to it and said to the old man, "Americano?" and with great feeling he replied, "O, mucho Americano."

A FAMILIAR STREET SCENE

WASHINGTON'S HEADQUARTERS AT VALLEY FORGE
A subject in which the Society is interested.

The Preservation of Scenic Places in America

By Katherine L. Smith

THE preservation of old and interesting places which have been hallowed by association or are attractive for beauty is interesting several National organizations, notably that of the American Scenic and Historic Preservation Society. This National organization of men and women has for its aim the protection of beautiful features of the natural landscape from destruction either by physical alterations or the erection of unsightly structures, the preservation of remarkable geological formations, and the saving from obliteration of names, places, and objects identified with National or local history.

This Society was founded by its President, the Hon. Andrew H. Green, of New York, and numbers among its active members such influential persons as George W. Perkins, of the New York Life Insurance Company; J. P. Morgan; the Hon. Abram S. Hewitt, and others. The Daughters of the American Revolution and the Colonial Dames are also working along similar lines, and it is hoped that a little at least of our heritage of the past in beauty and history may be saved from the hands of vandals and the ravages of time.

Prominent among efforts in these directions is the purchase by the State of New York and the rehabilitation of the historic Stony Point Battlefield on the Hudson, and the thirty-odd acres at the head of Lake George, made famous by events during the French and Indian and Revolutionary Wars, and selected by Cooper as the principal scene of his romantic novel "The Last of the Mohicans." Efforts are also being made to preserve Watkins Glen as a State Reservation and to make it a free country park. In this case it is hoped visitors will be attracted from all over the country and the place will become more familiar to the traveling public.

No visitor to historic places can help a

THE MORRIS MANOR-HOUSE—WASHINGTON'S HEADQUARTERS

Last year the Society secured the passage of an ordinance to take the mansion and grounds as public property. This was vetoed on a technicality, but will probably pass this year

PHILIPSE MANOR-HOUSE, YONKERS, N. Y.

Now used as the City Hall. The Society hopes to have it bought by the State, to be preserved.

WATKINS GLEN

For three years the Society has secured the introduction of a bill for the creation of a State Park embracing Watkins Glen. The bill has not yet passed.

feeling of gratitude when he finds the picturesque has been left untouched. We owe more than a debt of thankfulness to the energetic women who have preserved the birthplace of the flag in Philadelphia, have given contributions to the collections in Independence Hall, have preserved the landmarks at Valley Forge, and have prevented the destruction or desecration of buildings made sacred by their association with American history.

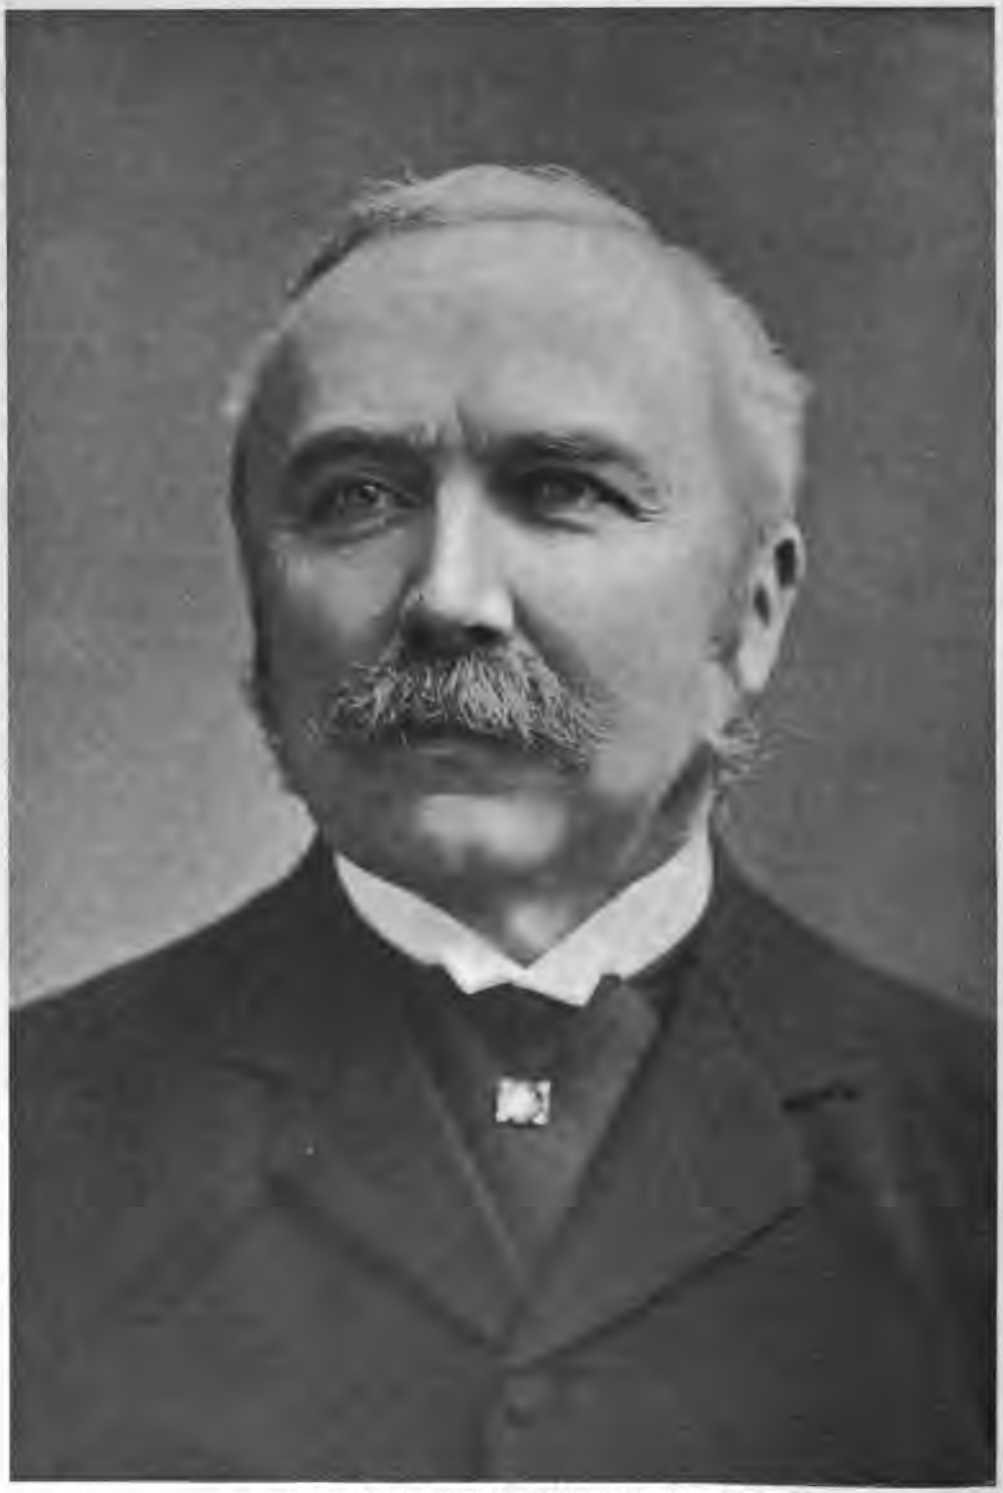
In 1900 the American Scenic and Historic Society began its notable achievement of preserving the world-renowned Palisades of the Hudson. Through its intercession both New Jersey and New York became interested, and we have now every prospect of an inter-State park, with drive, from Fort Lee to Nyack. By these means one of the most interesting spots in our country will be saved from the stone-quarryman and disfigurement. The ruins of Forts Crown Point and Ticonderoga are similar objects of solicitude.

THE COLORADO CLIFF DWELLINGS

The Society is trying to preserve these from wanton vandalism.

Nor are the efforts of these societies confined to the Eastern States alone, for their interest is widespread, and they co-operate with local societies and lend aid when asked to do so in every State in the Union, from the shores of Lake Champlain to the extreme West. The preservation of the giant sequoias of California is a matter of solicitude, not alone to the State in which they are situated, but to these societies, who are using every effort to help save these leafy giants, which are the growth of centuries and which hundreds of years cannot replace. In another part of the West the women of Colorado, aided by outside societies, are

THE HUDSON RIVER PALISADES



The Society represented the State of New York in securing the legislation which created the Palisades Inter-State Park Commission.

struggling to preserve the picturesque ruins of the Cliff Dwellers and to save from wanton vandalism and stealing the pottery and relics of this interesting race. This, the only spot in America where prehistoric barbarism can be studied in its entirety, is at last to be preserved, if the untiring efforts of speech and press can accomplish it.

Another object of solicitude are the old buildings of Fort Snelling at the head of the Mississippi River. Situated on a commanding bluff overlooking the great Father of Waters, this fort was for years the resting and protecting place of the missionary, the trader, and the early settler. It possesses a round stone tower built in 1820 for the safety of women and children in case of an attack by the Indians, and, aside from historic associations, is one of the most picturesque spots to be found in the Northwest.

These societies realize that every movement for the beautification of municipal or country environment should take into consideration, not only the pleasure and gratification of the adult population, but of the coming generation as well, for they will reap the benefit of reforms. For fine architectural relics of colonial days is receiving special attention. Washington's headquarters in New York City, the home of Aaron Burr and Washington, with a fine location, architectural beauties, and historic associations, the Alexander Hamilton residence, and the cottage in which Poe wrote many of his beautiful poems, are among the many dwellings that these societies feel it desirable to preserve. Already alive to similar undertakings,

THE RT. HON. SIR HENRY CAMPBELL-BANNERMAN

the late rebellion. The thirty-sixth lineal descendant, as he is, from that Ali who was the uncle and son-in-law of the prophet Mahomet, the present Sultan is also the son of a Circassian mother, and would seem to inherit some of the virtues belonging to her northern blood. He has endeavored to collect taxes honestly; he has allowed the arrest of criminals who had taken refuge in the porches of mosques; last, but not least, he sometimes dresses in semi-European costume, and actually rides in a motor-car! These things have helped the Pretender's cause; and he worked upon the bigoted sects among the Moors who have always been opposed to any kind of reform. If he had succeeded in battle, the whole country might have fallen back into barbarism; as it is, we may expect that Morocco, whether it comes into the sphere of influence of a particular European power or not, will show a few more signs of civilization. The ancient industries—weaving, leather-work, cutlery, etc.—which once made the name Moroccan a thing to conjure with, may yet be revived, although Switzerland, France, Russia, and Germany have now succeeded to much of those manufactures. The very name of the capital, Fez, is still a household word wherever the tarbush or turban is worn, although long since the Oriental manufacture of fezes has been removed to Tunis, while the cheap imitation, so often seen, comes from Switzerland.

The Federation of Churches

The third Annual Conference of the National Federation of Churches and Christian Workers was held at the Bible House, New York, February 3. The reports presented showed a gratifying though not rapid progress of the movement. Following the example set by Nebraska last October, California has now organized, and was represented by Dr. J. R. McLean, President of Pacific Theological Seminary. Among the subjects discussed and favorably received, of much practical importance was a plan [illegible] interdenominational affiliation [illegible] its broad application [illegible] some time since [illegible] to this plan, a [illegible] resident for

THE RT. HON. SIR HENRY CAMPBELL-BANNERMAN

Sir Henry Campbell-Bannerman

By Justin McCarthy

Author of "A History of Our Own Times," "The Story of Gladstone's Life," etc.

SIR HENRY CAMPBELL-BANNERMAN has but lately come to hold that position in the House of Commons and in the political world which those who knew him well always believed him destined to attain. He is now not merely the nominal leader of the Liberal Opposition in the House of Commons, but he is universally regarded as one of the very small number of men who could possibly be chosen for such a place. Sir William Harcourt and Mr. John Morley are the only Liberal members of the House who could compare with Sir Henry Campbell-Bannerman for influence with the Liberal party, the House of Commons, and the general public. Yet the time is not far distant when he was commonly regarded in the House as a somewhat heavy, not to say stolid, man, one of whom nothing better could be said than that he would probably be capable of quiet, steady work in some subordinate department. I remember well that when Campbell-Bannerman was appointed Chief Secretary to the Lord-Lieutenant of Ireland in 1884, a witty Irish member explained the appointment by the suggestion that Gladstone had made use of Campbell-Bannerman on the principle illustrated by the employment of a sand-bag as part of the defenses of a military fort. Campbell-Bannerman had, in fact, none of the temperament which makes a man anxious to display himself in debate, and whenever, during his earlier years of Parliamentary life, he delivered a speech in the House of Commons, his desire seemed to be to get through the task as quickly as possible and be done with it. He appears to be a man of a naturally reserved habitude, with indeed something of shyness about him, and a decided capacity for silence wherever there is no pressing occasion for speech, whether in public or in private.

Many whom I knew were at one time inclined to regard Campbell-Bannerman as a typical specimen of his Scottish compatriots, who are facetiously said to joke with difficulty. As a matter of fact, Campbell-Bannerman has a keen and delightful sense of humor, and can illustrate the weakness of an opponent's case better than some recognized wits could do, by a few happy touches of sarcasm. He is in every sense of the word a strong man, and, like some other strong men, only seemed to know his own strength and to be capable of putting it into action when hard fortune had brought him into political difficulties through which it appeared well-nigh impossible that he could make his way. Schiller's hero declares that it must be night before his star can shine, and although Campbell-Bannerman is not quite so poetic and picturesque a figure as Wallenstein, yet I think he might fairly comfort himself by some such encouraging reflection. He had gone through a long and hard-working career in the House of Commons before the world came to know anything of his strength, his judgment, and his courage. He got his education at the University of Glasgow and afterwards at Trinity College, Cambridge, and he obtained a seat in the House of Commons for a Scottish constituency as a Liberal when he was still but a young man. He has held various offices in Liberal administrations. He was Secretary to the Admiralty in 1882, and was Chief Secretary to the Lord-Lieutenant of Ireland for a short time a little later. There is not much to be said about his Irish administration. He governed the country about as well as any English Minister could have done under such conditions, for this was before Gladstone and the Liberal party had been converted to the principle of Home Rule for Ireland; and, at all events, he made himself agreeable to those Irishmen with whom he came into contact by his unaffected manners and his quiet good humor. When Gladstone took office in 1886, Campbell-Bannerman became Secretary for War, and

[1] This forms the eighth of a series of articles on living British statesmen. Subjects already treated are: Mr. Balfour, Lord Salisbury, Mr. John Morley, Mr. Henry Labouchere, Lord Aberdeen, Sir William Harcourt. Other articles will have as their subjects Sir Michael Hicks-Beach, John Redmond, John Burns.

he held the same important position in Gladstone's Ministry of 1892.

The story of that administration tells of a most important epoch in the career of Gladstone and the fortunes of the Liberal party. In 1893 Gladstone brought in his second Home Rule measure for Ireland. His first measure of Home Rule was introduced in 1886, and was defeated in the House of Commons by means of a coalition between the Liberal secessionists and the Conservative Opposition. The Liberal secessionists in the House of Commons, as most of my readers will remember, were led by Joseph Chamberlain. Then there came an interval of Conservative government, and when Gladstone returned to power in 1892 he introduced before long his second measure of Home Rule. The second measure was in many ways a distinct improvement on the first, and in the meantime some of the Liberal secessionists, including Sir George Trevelyan, whose opposition was directed only against certain parts of the first measure, had returned to their allegiance and were ready to give Gladstone all the support in their power for his second attempt. The Home Rule measure was carried through the House of Commons by what we call a substantial although not a great majority, and then it had to go to the House of Lords. Everybody knew in advance what its fate must be in the hereditary chamber. Every great measure of genuine political reform is certain to be rejected in the first instance by the House of Lords. This is the old story, and is repeated again and again with monotonous iteration. The House of Lords always gives way in the end, when the pressure of public opinion from without makes it perilous for the hereditary legislators to maintain their opposition. Therefore the Liberals in general were not much disconcerted by the defeat of the Home Rule measure in the House of Lords. Home Rule for Ireland had been sanctioned by the decisive vote of the House of Commons, and the general impression was that it would only have to be brought in again and perhaps again, according to the usual process with all reform measures, until the opposition of the Lords had been completely borne down. But before the introduction of the second Home Rule measure, some events had taken place which made a great change in the condition of Irish political affairs and put fresh difficulties in the way of Gladstone's new administration.

The Parnell divorce case came on, and led to a serious division in the ranks of the Irish National party and in Irish public opinion. The great majority of Parnell's followers refused to regard him as their leader any longer, and those who determined to support him and to follow him through thick and thin were but a very small minority. Gladstone was firmly convinced, as were the majority of the Irish Nationalist members, that Parnell ought to retire, for a time at least, from the leadership of his party, if not indeed from public life, and keep aloof from active politics until the scandal of the divorce court should have been atoned for by him and should have passed to some extent from public memory. Gladstone was convinced that if Parnell remained the leader of the Irish party it would be almost impossible to arouse in the British constituencies any enthusiasm in the cause of Home Rule strong enough to bring back the Liberals to power and to carry a Home Rule measure. This was a reasonable and practical view of the question, but Parnell and his followers resented it as a positive insult, and Parnell issued a manifesto denouncing Gladstone, the immediate result of which was that break-up of the Home Rule party I have already mentioned. Not very long after came Parnell's early death. It may well be supposed that such events as these must have made a deep and discouraging impression on Gladstone's hopes for the success of the second Home Rule measure. The Irish National party had been broken up for the time, and some even of Gladstone's colleagues in office had allowed themselves to be mastered by the old familiar idea that as Irishmen could not be brought to agree for long on any plan of action, it was futile for English Liberals to put themselves to any inconvenience for the sake of an Irish National cause. Such men might have found it difficult to point out any great measure of political reform in England concerning which the English people had always been in absolute agreement and about which there was no conflict of

angry emotion in any section of English representatives. But the fact remained, all the same, that the dispute in the Irish party had brought a chill to the zeal of many influential English Liberals for the Home Rule cause, and we have had in much more recent days abundant evidence that the chilling influence is with them still.

Among Gladstone's official colleagues there were some who held that the time had come when an appeal ought to be made to the country by means of a dissolution and a general election against the domination of the House of Lords. This appears to have been the opinion of Gladstone himself. Others of his colleagues, however, held back from such an issue, while admitting that the moment did not seem favorable for an appeal to the country on the distinct question of Irish Home Rule. The general impression on the public mind was that the decision of the Cabinet was certain to be in favor of an appeal to the country on the one issue or the other, and much surprise was felt when it began to be more and more evident that the Government intended to go on with the ordinary business of the State, as if nothing had happened. The outer world has as yet had no means of knowing what the reasons or the influences were which induced Gladstone and his colleagues to come to this determination. The whole truth will probably never be known until John Morley's Life of Gladstone shall make its appearance. We may safely assume in the meantime that Gladstone had the best reasons for taking the course which he adopted, and that he would have made an appeal to the country against the decision of the House of Lords if he had believed the conditions were favorable for such a challenge just then. Probably Gladstone knew only too well that even among his own colleagues there were some who were turning cold upon the question of Home Rule, who had never accepted his views on that subject with whole-hearted willingness, and could not have been relied upon as steadfast adherents in such a struggle. I think I shall be fully justified by any revelations which history or biography has yet to make, when I say that Campbell-Bannerman was among those who would have faithfully followed the great leader to the very last in whatever struggle he had made up his mind to encounter. There were, of course, many others of Gladstone's colleagues—men like Sir William Harcourt and John Morley and James Bryce—on whom their leader could have safely reckoned for the same unswerving fidelity and courage. But, whatever were the reasons, there was no appeal made to the country, and the administration went on with its ordinary work in a dull, mechanical fashion. The effect upon the Liberal party was most depressing. Men could not understand why nothing decisive had been done, and at the same time were haunted by a foreboding that some great change was impending over the Liberal party.

The foreboding soon came to be justified. On the 1st of March, 1894, Gladstone delivered his last speech in the House of Commons. The speech dealt with the action of the House of Lords on a subject of comparatively slight importance. The Lords had rejected a measure dealing with the constitution of parish councils, which had been passed by the House of Commons. Gladstone spoke with severity in condemnation of the course taken by the House of Lords. Towards the close of his speech he said: "My duty terminates with calling the attention of this House to a fact which it is really impossible to set aside, that we are considering a part—an essential and inseparable part—of a question enormously large, a question which has become profoundly a truth, a question that will demand a settlement, and must at an early date receive that settlement, from the highest authority." No one who was present in the House when this declaration was made is ever likely to lose the memory of the scene, although not all or even most of those then present quite realized the full significance of Gladstone's words. There were many in the House who did not at once understand that in the words I have quoted the greatest Parliamentary leader of modern times was speaking his farewell to public life. I remember well that a few moments after Gladstone had finished his speech I met John Morley in one of the lobbies, and I asked him if this was really to be taken as the close of Gladstone's career, and he told me, with as much composure

as he could command, that in that speech we had heard the last of Gladstone's Parliamentary utterances. That was indeed a memorable day in the history of England, and a day at least equally memorable in the history of Ireland.

I have had to dwell for a while on these historical facts, facts of course known already to all my readers, as a prelude to the most important passages in the Parliamentary career of Campbell-Bannerman. When Gladstone resigned office and withdrew from public life, the question of reconstituting the Liberal administration had to be taken into account. There could be no doubt whatever that the Liberal administration had been much weakened and even discredited by the manner in which it had put up with the domineering action of the House of Lords. The effect on public opinion was all the greater and the more disheartening because it was generally understood that the absence of any such action must have been due to the fact that some of Gladstone's leading colleagues were not prepared to sustain him in the policy he was anxious to carry out. There was therefore a state of something like apathy in the minds of advanced Radicals with regard to any arrangements which seemed likely to be made for the reconstruction of the Ministry. The new administration was formed under the leadership of Lord Rosebery, as Prime Minister, in the House of Lords, and that of Sir William Harcourt as Chancellor of the Exchequer in the House of Commons. There can be little doubt that the composition of the new Ministry was regarded as unsatisfactory by the more advanced Liberals in and outside Parliament. The Liberal party is never of late years quite content with an administration which has its Prime Minister in the House of Lords. The real work must always be done in the House of Commons, and it is obviously most inconvenient that the leader of the Government should be one whose position will not allow him to have a seat in the representative chamber. The condition of things is something like that of an army whose Commander-in-chief can never make his appearance in the encampment or take part in any of the great battles. Even at that time Lord Rosebery, although a most brilliant debater and a capable [illegible]trator, was beginning to be regarded as one whose Liberalism was somewhat losing color and whose whole heart was by no means in the advanced policy of Gladstone. There was nothing better to be done, however, at the time than to make the most of the altered conditions, and the new Ministry went to work as well as it could. Campbell-Bannerman, as Secretary for War, had an opportunity of proving his genuine capacity for the duties of his important office. He introduced a new and complete scheme of army reform, which, among other and even more important changes, proposed to bring about the retirement of the Duke of Cambridge from the post of Commander-in-chief. The Duke of Cambridge was even then a man far advanced in years, who had never in his life shown any real capacity for the work of commanding an army, and whose chief recommendation for so great a position must have been found in the fact that he was a member of the royal family. The new measure was making its way steadily enough through the House of Commons, and every one was beginning to see that in Campbell-Bannerman the country had found an administrator of a very high order. Suddenly, however, the progress of the measure was interrupted by what seemed to be at first only a trivial accident, of which the public in general were inclined to take but little account. The army reform scheme had arrived at what is known as the committee stage of its progress.

I do not desire to occupy the attention of my readers more than is actually necessary with the mere technical details of Parliamentary procedure, and I shall only explain that when a bill reaches the committee stage its general principle must have been already accepted by the majority in the House, and the House then forms itself into committee for the purpose of discussing the mere details of the proposed arrangements. During one of the sittings a Conservative member proposed a motion declaring that the Government, or at least the War Office, had not made proper provision for the supply of the material of cordite to the army. This was so purely a technical question, concerning which only soldiers and scientific men could be supposed to have had any means of forming an opinion, that the House troubled itself very

little about the whole discussion. But when the House came to take a division on the proposal, the Government was defeated by a majority of seven. This defeat, however, produced at first only a very slight effect on the House in general. During the committee stage of a measure it is quite a matter of ordinary occurrence that a Ministry should be defeated on some question of mere arrangement and detail, and very few in the House of Commons suspected on that occasion that such a vote was likely to bring with it an important Parliamentary crisis. Campbell-Bannerman, however, took a very different view of the event. He appears to have made up his mind that the decision of the House was a distinct vote of censure on his administration, and that he could not continue to hold office after such a declaration of disapproval. Now, it may be taken for granted that Campbell-Bannerman was not merely actuated by any personal feeling, by any sense of mere grievance to himself, when he made up his mind to such a resolve. He saw clearly that the Government had lost the confidence and the support of the country, and that the sooner the whole futile attempt at administration under such conditions came to an end the better it would be for the business of the State. He knew perfectly well that the Liberal administration was falling to pieces, that its leading members were no longer inspired alike by one great policy, that some of its leaders had ceased to be Liberals in the traditional meaning of the word, and that sooner or later the catastrophe must come. Those of Campbell-Bannerman's colleagues who were as genuine and stanch Liberals as he soon came into agreement with him as to the course that ought to be pursued, and it was made known before long to the House of Commons that the Liberal Ministers had resigned their offices and that the long-postponed appeal to the country was to be made at last. Thus for the first time it became known to the public that Campbell-Bannerman was already a power in political life.

Parliament was dissolved and the appeal to the country was made at the general election which necessarily followed. Few Liberals had the slightest doubt as to the result of the appeal. Some of the very measures introduced by the fallen Government which had the strong approval of many advanced Liberals had put certain powerful interests and classes against those who represented such a policy. Sir William Harcourt's "death duties" had aroused the indignation of rich men here, there, and everywhere. The measures which the same statesman had endeavored to carry for putting the liquor trade under the control of "local option" had turned the publicans into an organized opposition against Liberal administrators. The result of the general election was the defeat of the Liberal party, and the formation of a Conservative government with Lord Salisbury at its head holding office as Prime Minister and Foreign Secretary at once, and with Arthur Balfour as First Lord of the Treasury and leader of the House of Commons. The Liberals were weakened in every sense, not merely by the fact that they had come back to Parliament no longer as a Government but only as an Opposition. They were rendered by their internal divisions too weak for effective work as an Opposition. Lord Rosebery continued for the time to act as leader of the Liberal party, while Sir William Harcourt of course became leader of the Opposition in the House of Commons. It soon was made quite clear that the Liberal party could not work together so far as its leaders were concerned. It was evident that men like Harcourt and John Morley and Campbell-Bannerman could not act in any cordial union with Lord Rosebery and those Liberals who accepted Lord Rosebery's policy. The result of all this was that Lord Rosebery resigned the leadership of the party and has ever since seemed inclined to start a Liberal party of his own, and that Sir William Harcourt did not believe he was likely to receive such a united support in the House of Commons as would enable him to maintain the leadership of the party in that House with any satisfaction to himself or the country. Harcourt therefore ceased to hold that position; and now came for the first time the opportunity for Campbell-Bannerman. He was chosen leader of the Liberal party in the House of Commons, and he had before him, under all the conditions, a task which might well have seemed hopeless. Lord Rosebery kept on, from that time to this, delivering

speeches all over the country which could only be interpreted as the expression of his desire to call into being a new Liberal party professing a political creed differing in its main characteristics from that which had been proclaimed and carried on by Gladstone. Rosebery renounced Home Rule for Ireland, and refused to act on Gladstone's principles with regard to the protection of Christians in the East against the alternating tyranny and neglect of the Ottoman Government.

Never within my recollection had any leader of a Liberal party in the House of Commons come into a position of such difficulty and disheartenment as that which Campbell-Bannerman had now to maintain. It has, of course, often been the lot of the Liberal party to come into the House of Commons with diminished numbers, and have to carry on as best it could be done the battle against a Conservative Government of overwhelming numerical strength. But the peculiar trouble which beset Campbell-Bannerman was that he could not count upon the allegiance of all his nominal followers. He knew that so long as he showed himself determined to maintain the policy of Gladstone he could reckon without fear on the support of such men as Harcourt and John Morley and Bryce. But there were able men among those who occupied the front bench of Opposition on whom he knew he could not always count, men who were publicly displaying themselves as the political associates or followers of Lord Rosebery. Campbell-Bannerman went boldly and steadfastly on, never faltering in the least. He upheld the time-honored creed of genuine Liberalism, "never doubted clouds would break," and by his words and his bearing inspired with fresh courage many a genuine Liberal whose faith was not faltering, but whose hopes were sinking low. He proved himself quite equal to the incessant work put upon him by his new position as leader of the Liberal party in the House of Commons. He developed a capacity for debate which only those who knew him well had ever before believed him to possess. During all the wild excitement of Jingoism which followed the movements of the war against the two South African Repub-

he never yielded to the temptation

overcame so many other Liberals,

the temptation to evade a passing unpopularity by suppressing for the time his opinions on the policy of the war. He must have been sorely tried again and again by the sayings and doings of some who still professed to be members of the Liberal party in Parliament. A new Liberal League was actually formed under the inspiration of Lord Rosebery, and its object apparently was to create a new school of Liberalism which should have nothing to do with the traditions of the party and with the doctrines of men like Gladstone.

Now, if all this had been done in open and avowed antagonism to the existing Liberal party, Campbell-Bannerman might have had a comparatively easy task to undertake. He could have braced himself up to do sturdy battle against the promoters of internal disunion; could have set the whole question plainly and squarely before the public Liberal opinion of the country, and demanded a decisive judgment. But the promoters of the new Liberal League did nothing of the kind. They disclaimed any intention to create disunion in the party. They declared that they were the very best of Liberals, and that nothing could exceed their loyalty to the elected leaders of the Liberal party, and protested that in whatever they did they were only trying to help and not to hinder the work of these leaders. When one of the seceders, or supposed seceders, delivered a speech at some public meeting in which he appeared to repudiate the main principles of the Liberal creed, and an open split in the party seemed to be imminent, some other member of the Liberal League hastened to explain that the meaning of his noble friend or his right honorable colleague had been totally misunderstood. He insisted that the only motive of the previous orator was to promote the whole cordial union of the Liberal party, and, to paraphrase the words of the medical student in "Pickwick" after his quarrel with a fellow-student, that he rather preferred Campbell-Bannerman to his own brother.

Campbell-Bannerman took all these performances with serene good humor. As I have already said, those who know him are well aware that he has a keen, quiet sense of humor, and I feel sure that he must have been often much amused

by the odd vagaries of those who would neither fall into the ranks nor admit that they wanted to keep out of the ranks. He has gone steadily on as he began since it became his duty to lead the Liberal opposition in the House of Commons. He has done the work of leader honorably, patiently, consistently, and fearlessly, and he is recognized as leader by all true Liberals, English, Scottish, and Welsh, and he has never fallen away in the slightest degree from the principles of Gladstone where Home Rule and the other just claims of the Irish people are concerned. He has kept the Liberal flag flying, and the whole Liberalism of the country is already beginning to rally round him and to recognize his leadership. Increasing responsibility has only developed in him new capacity to maintain the responsible place. We may well believe that he is destined to do great service yet to the Liberal cause, and to win an honorable place in British history. When he first became leader of the Liberal party in the House of Commons, he might almost have seemed to be the leader of a lost cause, but he has fought the fight bravely and will see the victory before long.

Books of the Week

This report of current literature is supplemented by fuller reviews of such books as in the judgment of the editors are of special importance to our readers. Any of these books will be sent by the publishers of The Outlook, postpaid, to any address on receipt of the published price, with postage added when the price is marked "net."

Among the Trees Again. By Evaleen Stein. The Bowen-Merrill Co., Indianapolis. 4×7 in. 90 pages.

Around the World through Japan. By Walter Del Mar. Illustrated. The Macmillan Co., New York. 5¾×9 in. 435 pages. $3.

The author did much more than follow the beaten route of travel and seek for entertainment and the picturesque. He looked into the domestic and industrial life of the Japanese pretty closely, and his comments are often severely critical. For instance, he declares positively that it is almost impossible to hold Japanese merchants to their contracts, and that they are noted for "organized dishonesty;" that even at the Government railway ticket offices one gets wrong change more often than not, partly because public servants are so badly paid that they are tempted to dishonesty, and partly because they are so ignorant that they do not calculate correctly. The book has no literary pretensions, and it is thrown together in rather a rough-and-ready way, but it certainly contains a great amount of information. There are some faults of taste in the passages treating of the vice of Japan. Mr. Del Mar visited Hongkong, Shanghai (by the way, he found the Chinese merchant honest beyond cavil), Ceylon, Java, and other places as well as Japan. There are many pictures.

Bethlehem: A Nativity Play. By Laurence Housman. The Macmillan Co., New York. 5×7 in, 76 pages. $1.25, net.

This latest experiment in the field of miracle-play writing cannot be regarded as a notable success. It is a very respectable piece of verse cast in the old form, entirely reverent, and conforming to the requirements of the mediæval miracle-drama; but it is a piece of skill rather than a work of genius; it lacks feeling, and it nowhere convinces the reader. Readers of The Outlook will remember that it was produced as a play in London not long ago, and that it failed to awaken any great interest. It is, at the best, an imitation; and the modern mind is so far removed from the attitude and temper which made the miracle-play possible that it is probably beyond the power of any save a poet of the highest genius and the deepest feeling to recall the piety, the reverence, and the poetry of the miracle-play.

Daughter of Raasay (A). By William MacLeod Raine. The Frederick A. Stokes Co., New York. 5×7½ in. $1.50.

Delight the Soul of Art: Five Lectures. By Arthur Jerome Eddy. The J. B. Lippincott Co., Philadelphia. 5×7¾ in. 287 pages. $1.50, net.

English Essays. Edited by Edward Everett Hale, Jr., Ph.D. (The Hawthorne Classics.) Globe School Book Co., New York. 4½×7 in. 240 pages.

Fatherhood of God (The): In Christian Truth and Life. By J. Scott Lidgett, M.A. Charles Scribner's Sons, New York. 5½×9 in. 427 pages. $3, net.

Mr. Lidgett's experience as Warden of the Bermondsey Settlement in London has deeply impressed him with the conviction that the ground of social unity and the principles of social co-operation are given only by the Biblical doctrine of the Fatherhood of God. The history of Christian doctrine shows the gradual disappearance of this, the cardinal truth in the New Testament, and more recently its slow and partial recovery. The doctrine of divine Fatherhood, as adumbrated in the Old Testament, and as treated in the successive periods of Church history to the present time, is elaborately reviewed. The general influences tending to restore the New Testament conception have been, as stated here, the new apprehension of the humanity of Christ, a recognition of the principle of a developing revelation, and more serious use of the doc-

trine of the Trinity; also a taking for the starting-point the creation of man instead of his fall, a fuller apprehension of the divine immanence, a sense of the religious worth of the secular life, and a more humane tone of social life. From these tendencies Mr. Lidgett regards the Oxford Movement as essentially reactionary toward the mediæval thought of the divine Sovereignty. On the other hand, he recognizes a modern proclivity to a sentimental weakening of the idea of Fatherhood, obscuring the truth of a righteous Sovereignty. The task of theology at present is so to restate the New Testament doctrine as to give it its true pre-eminence as the ideal for the regulation of the community. Whether Mr. Lidgett has chosen the most effective way to do this by a presentation of the doctrines of the Incarnation and the Atonement, as held by orthodox churches, may be open to a difference of opinion. Those who, though holding to these doctrines in some form, here feel obliged to part company with him, can follow him so far with general satisfaction.

Gentle Art of Making Happy (The). By G. H. Morrison, M.A. The Fleming H. Revell Co., New York. 5×7½ in. 60 pages. 35c., net.

Historic Highways of America. Vol. III. **Washington's Road (Nemacolin's Path).** By Archer Butler Hulbert. Illustrated. The Arthur H. Clark Co., Cleveland, Ohio. 5×7¾ in. 215 pages. $2.50, net.

The third volume of "Historic Highways" is the most interesting yet issued. It tells about Washington's road built over the Indian trail known as "Nemacolin's Path," of which an exquisite illustration forms the frontispiece of the volume. In 1754 the young Virginian lieutenant-colonel opened the road, and Mr. Hulbert is well within the mark in saying that it formed the first and most important link in the chain of Federal union.

History of the Church of Christ (A). By Herbert Kelly. Vol. II. From 324 to 430 A.D. Longmans, Green & Co., New York. 5×7¾ in. 341 pages.

History of the French Revolution. By C. L. James. Abe Isaak, Jr., Chicago. 5×8 in. 343 pages.

This work appeared serially in the pages of "Free Society," Chicago. It is written with some literary ability from the standpoint of philosophical Anarchism, which deems it impossible so to organize government that it shall be beneficent, not tyrannical.

London Manual for 1903 (The). (Seventh Year of Publication.) Edited by Robert Donald. Illustrated. Edward Lloyd, London. 5×7½ in. 314 pages.

Manner of Life of Nancy Hempstead (The). By Mary L. B. Branch. C. J. Victs, New London, Conn. 5×9½ in. 29 pages. 35c.

Man's Position in the Universe: A Rough Survey. By W. Sedgwick. George Allen, London. 5×7½ in. 291 pages.

The general theme of this work is the correspondence between the physical and the moral order of nature. This is presented in an analogy between the conflict of good and evil powers for the soul of man, and the conflict of natural forces for the possession of atoms. We are unable to discuss the peculiar corpuscular theory of the author, but the Biblical ideas of which he avails himself for the purpose of his analogy are not all such as hold their own in modern thought.

Manual of Church History (A). By Albert Henry Newman, D.D., LL.D. Vol. II. The American Baptist Publication Society, Philadelphia. 5⅛×8¼ in. 724 pages. $1.75, net.

This volume sustains the reputation established by its predecessor for critical, sound, and varied learning. While it necessarily touches on many points of controversy, it is eminently characterized by fairness. No other of the standard church histories in the English tongue deals so thoroughly and so fairly with those progenitors of the free democratic, or congregational, type of Christianity who, under the name of Anabaptists, have suffered much from undiscriminating censure. This is a topic of church history that has greatly needed to be rewritten, and to be treated, as Dr. Newman treats it, with that fullness which is essential to judicial fairness. Distinguishing the fanatical Anabaptists, whose premillenarian dreams led on to the outburst of wild license in the sanguinary insurrection of the German peasants in 1525, from those whom he terms "the soundly Biblical" kind, Dr. Newman presents these to us as worthy of our admiration. His interest in this type of Christianity is apparent from the large space he assigns to it in his account of the Anglo-American denominations, in which the Plymouth Brethren occupy more pages than the Methodists. His judgment upon the point at issue in the recent Whittsit controversy, that immersion did not become the rule among English Baptists till after 1640, can hardly fail to grieve some of his Southern brethren, the more so because it is incontrovertible. In connection with his statement that the oldest Congregational churches in Boston and vicinity became Unitarian, the First Church in Lynn, founded in 1632, is to be noted as an exception, though the only one. There is an attractive flavor of freedom and freshness in Dr. Newman's work, though one may occasionally hesitate in accepting his views. In the estimate of Luther, for instance, it may seem that more allowance is to be made for the coarse and half-barbarian temper of that time.

Queen Victoria. By Sidney Lee. The Macmillan Co., New York. 5⅛×8 in. 611 pages. $3.

Reserved for later notice.

Raleigh in Guiana, etc. By Barrett Wendell. Charles Scribner's Sons, New York. 5⅛×8 in. 143 pages. $1.50, net.

Real Things in Nature: A Reading Book of Science for American Boys and Girls. Illustrated. By Edward S. Holden, Sc.D., LL.D. The Macmillan Co., New York. 4⅛×7 in. 443 pages.

A plainly written series of talks about mechanics, physics, physiology, electricity, natural history, geology, and other branches of science. The author answers clearly just such questions as intelligent American boys would be likely to ask. There are numerous explanatory pictures and diagrams.

Road (The): The Ever-Existent, Universal, and Only Religion of God. By Charles Clark Harrah. Scott Heights Book Co., Des Moines, Ia. 5×6¾ in. 144 pages. 25c.

Sabbath Transferred (The). By Rev. Johns D. Parker, Ph.D. (Second Edition, Revised and Enlarged.) Johns D. Parker & Co., East Orange, N. J. 5×7½ in. 242 pages. $1.50.

The traditional belief is that the observance of one day in seven as holy time was transferred from Saturday to Sunday by Apostolic sanction in the first century. The historical fact is that the observance of the Mosaic Sabbath ceased with the extinction of those who had kept it sacred—the Jewish-Christian section of the Church; while the Gentile-Christians, who thenceforward constituted the Church, had from the first observed Sunday only—the Lord's day. It was not a transfer so much as a survival of the fittest. Dr. Parker's theory is that the Sabbath as an institution was transferred from Saturday to Sunday by divine authority on the morning of the resurrection of Christ. Evidence for this is presented by his translation of Matthew xxviii. 1, where, for the accepted rendering, "toward the first day of the week," he substitutes "*toward one of the Sabbaths*, that is, the Christian Sabbath." The implication of this phrase seems to him to be that the day of Jesus' resurrection succeeded to the ancient Saturday-Sabbath as a day guarded by divine sanctions. It may be said that Dr. Parker's translation, though defensible as permissible, is rather precarious. Assent to the divine authority claimed for the "transfer" may reasonably require surer ground than two words in a narrative of unknown authorship and considerably later date than the event. As an argument with Sabbatarian Christians who still adhere to a Saturday observance Dr. Parker's reasoning may have some weight, and he applies it to them, saying that "Sabbatarianism is founded on a false translation." Not so; the quicksand underlying all Sabbatarian translations, true or false, is the fallacious notion of literalists generally, that the religious spirit is not in free control of all religious forms and ordinances.

Story of Alchemy and the Beginnings of Chemistry (The). By M. M. Pattison Muir, M.A. Illustrated. D. Appleton & Co., New York. 4×6 in. 185 pages. 35c., net.

This is an interesting story of the unscientific gropings which turned ultimately into the path of science, through that futile pursuit of the impracticable which, as experience often illustrates, leads the blind in a way they know not to substantial good. The world owes much to human illusions such as the alchemical view of nature. But when Mr. Muir tells us that this view still forms the fallacious basis of systems of ethics, philosophy, and art, those who know most about these may wonder how much he knows.

School in the Home (The): A Study of the Debt Parents Owe Their Children. By Newell Dwight Hillis. The Fleming H. Revell Co., New York. 5×7¾ in. 126 pages. 50c., net.

The earliest, the most effective, yet the most neglected school in the world is the subject of a short essay to which Dr. Hillis here appends a selection of Scripture and hymns. The essay on the debt of parents to children is admirable, but the selection of hymns is faulty. In general, hymns for children to commit to memory should be free from the shibboleths of theological controversy. This principle rules out, to one's regret, Bishop Heber's otherwise admirable hymn for its dogmatic line,

"God in Three Persons, blessed Trinity."

Even Calvin objected to this phrase; why then teach it to children? Other examples of equally objectionable theologizing occur in Dr. Hillis's selection, and limit its serviceableness.

Second Bank of the United States (The). By Ralph C. H. Catterall. (The Decennial Publications. Second Series. Vol. II.) The University of Chicago Press, Chicago. 6×9 in. 538 pages.

Story of Good Will Farm (The). By G. W. Hinckley. Illustrated. The Good Will Publishing Co., East Fairfield, Me. 5×6¾ in. 139 pages. 75c.

Story of Oratorio (The). By Annie W. Patterson. Charles Scribner's Sons, New York. 5×7½ in. 241 pages. $1.25, net.

Devotion to oratorio is almost distinctively British. Even the German works in this form of music have their chief vogue in England. The later development of oratorio has become merged into the rise of the cantata, which has been especially fostered by respectable but not especially inspired British composers. The theme of this book will appeal, therefore, to an element in the "musical public" which is somewhat limited, and to a considerable degree distinct, in this country at least, from the great body of lovers of pure music. The volume is a product of conscientious work and genuine enthusiasm. It is well supplied with appendices and an index. It is a useful book of reference.

Story of the Trapper (The). By A. C. Laut. Illustrated. D. Appleton & Co., New York. 5×7¾ in. 284 pages. $1.25, net. (Postage, 12c.)

Miss Laut's former books about the frozen North have been fictitious in form, and have attracted comment by their vivid picturesqueness. Now she reconstructs for us the personality and tells of the wanderings of the trapper, who as a pioneer preceded the explorers of the West. She writes with animation and imaginative power—sometimes, indeed, one wishes that the imagination were restrained a little so as to make a better balance between plain fact and brilliant writing. All in all, it is a fine adventurous figure, this of the bold, wild master of woodcraft, who seems to love hardship and danger even more than he loves gain. The French or Indian trapper, the man who works for the Hudson's Bay Company or for his own hand, the seeker for otter, or beaver, or mink, or even buffalo—each has his traditions, his methods, and his peculiar points of interest. The book is in a way unique, and it is certainly readable.

Tarr and McMurry Geographies. Pennsylvania. Supplementary Volume. Illustrated. By William Rupert, C.E. The Macmillan Co., New York. 5⅛×7⅛ in. 101 pages.

Theology's Eminent Domain and Other Papers. By William Reed Huntington, D.D. Thomas Whittaker, New York. 5×7½ in. 129 pages. 25c.

Unpopular Papers. By Norman Alliston. George Allen, Charing Cross Road, London. 4¼×7 in. 201 pages.

Correspondence

The Study of Live Birds

To the Editors of The Outlook:

One of the results of a recent article published in your valuable periodical, entitled "A Talk on Birds," has been the opening of a correspondence between many of your readers and myself. These letters have come from all parts of the country, and from beyond its borders. They have given me much pleasure and information, and I wish publicly to express my obligation to the many writers. Not a few of these have visited my laboratory to see some of the sources of such inspiration as I talked of, and it has occurred to me that others might care to pay a call on these friends in feathers. Will you, therefore, extend such an invitation from me in your columns? I am at home for such visits always on Saturdays, and shall be glad to welcome those who wish to know more of the birds and the work they are doing.

W. E. D. Scott.

Laboratory for the Study of Live Birds,
341 Nassau Street, Princeton, N. J.

[We are sure that bird-lovers and readers generally will also be interested to know that the full narrative of Professor Scott's experiences and adventures as a naturalist and traveler will soon be published by the Outlook Company under the title "The Story of a Bird-Lover."—The Editors.]

"The Possibilities of Peat"

To the Editors of The Outlook:

While waiting communications which will give fuller answers to the many interesting letters called out by my article in The Outlook of January 17, it will allay curiosity to know that the firm making pressed peat is a Canadian house, and that $1.75 a ton is a liberal estimate of the cost of production. The royalties are probably the rent of bogs leased for taking out peat by Government or private owners. Canadian and foreign enterprise quite excels American in the matter of using peat. Beyond two or three small local firms and one supplying florists with common air-dried peat, I am yet unable to name any sources which furnish it. A few well-to-do families import Scotch peat use, but do not seem too willing to give any information on the subject. I should be glad to learn the addresses of any firms working in peat or peat machinery, here or abroad, as early as possible.

No subjects appear to be so little understood as the practical economy of fuels, and peat in particular. The Consuls of four countries applied to this month knew nothing of the excellent enterprise of manufacturers and scientific men in regard to peat in their own countries. Still, relentless perseverance will unearth the information wanted for immediate use—namely, firms here or abroad that will supply peat to burn and peat for interested manufacturers to examine. Inquirers may be sure their letters are welcome and will all receive attention. Experience dictates care in securing correct addresses to be used by fifty to a hundred eager correspondents, as well as the ability of firms to deal with such a serious addition to their regular work. I once forwarded about three hundred letters of inquiry for a new product to a manufacturer's agent in one of our large cities, to learn six weeks after that he grew tired of trying to answer them and burnt the whole batch without reply. The rest of the inquiries, many times the first installment, were sent to the manufacturer himself, who was interested enough to take care of them as they should be cared for. I will say again that correspondence on the subject of peat is entirely acceptable.

To many questions, it is enough to say $1.75 is a liberal estimate of the cost of making pressed peat, not the selling price.

S. Power.

37 West Nineteenth Street, New York City.

The Church and Young Men

In connection with the department of Sociology at the University of Chicago, a special investigation is being made of religious work on behalf of young men. The results are to be published in book form, and in order that the volume may be comprehensive and of real service, facts and suggestions from pastors, superintendents, and other church workers will be welcomed. Information as to books and magazine or newspaper articles bearing upon the subject is also desired. Any measure of co-operation will be much appreciated.

F. G. Cressey.

To keep the scalp healthy and the hair clean and sweet is a matter of first importance in the toilet of every man and woman.

Woodbury's Facial Soap

makes a perfect shampoo. Possesses peculiar properties that put the scalp in a condition of health. It cleanses and invigorates the hair without destroying the natural gloss, leaves it silky, smooth, and bright. 25c everywhere.

Special offer Our booklet, trial size package of Soap and Facial Cream sent for 5 cts. to pay postage, or for 10 cts. the same and samples of Woodbury's Facial Powder and Dental Cream. Address Dept. Z

IF YOU WANT THE BEST EXTRACT OF THE BEST BEEF, AT ALL TIMES, INSIST ON

ARMOUR'S EXTRACT OF BEEF

Made from well-fattened beeves. It has the rich beefy flavor of prime roast beef, and is void of the objectionable burnt taste so common to many beef extracts. As it is highly concentrated a very small quantity will give the desired meat juices and beef flavor for soups, sauces and beef tea. Sold only in jars bearing the Armour Label and name of Armour & Company, Chicago. *Sold by all retailers.*

"CULINARY WRINKLES," a cook book replete with many suggestions for its use. Sent postpaid on request.

TRADE "ASPAROX" MARK TOMATO BOUILLON

For lovers of good things to eat and drink.

A perfect seasoning and delightful drink. Made from asparagus and Armour's Extract of Beef, retaining the full flavor of fresh asparagus. At fountains and cafes.

Two sizes, 25c and 75c.
Sold by all Retailers.

For Oyster Cocktails, Hot Drinks, etc.

Not to be confounded with table catchup and similar preparations. All that is best in fresh ripe tomatoes, spices, herbs and meat, highly concentrated and deliciously seasoned. It is a tempting relish and a choice tomato stock for cooking purposes. Directions on each bottle. Two sizes, 25c and 75c. *Sold by all Retailers.*

The Outlook is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The first issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

Price.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

Postage is Prepaid by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila Samoa, Canada, and Mexico. For all other countries in the Postal Union add $1.56 for postage.

Change of Address.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

Discontinuances.—If a subscriber wishes his copy of the paper discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

How to Remit.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of THE OUTLOOK COMPANY. Cash should be sent in Registered Letter.

Letters should be addressed:

Every lot of Ivory Soap (every "boil" a soap-maker would say) is carefully analyzed, and frequent comparisons are made with analyses of the best of the popular castile and toilet soaps. Ivory Soap contains less of impurities, less of free alkali and more real soap than any of them; that is why it can be freely used without injury to the rose-leaf skin of the baby, to the sheerest of linens or to the daintiest of laces.

Registered Trade-Mark

McCutcheon Wash Waists

We invite attention to our new and exclusive models for Spring. They are made in all sizes, from 32 to 42 inches, in a wide range of materials of our own importation, including:

White Piques, $3.75 and $4.00.
White Vestings, $5.50 and $6.50.
Scotch Madras, $3.50 and $4.50.
Scotch and English Cheviots, $3.50, $4.00.
Butchers Linen, $4.00 and $5.00.
Hand Embroidered Linen Waist Patterns, $7.50 to $18.00.

If desired, the fabric may be purchased by the yard and made to order in our custom department at an extra charge of $1.00.

Special attention given to mail orders.

The Statehood Bill

The development last week of the proposal to admit New Mexico, Arizona, Oklahoma, and possibly Indian Territory as States showed indications that Senator Quay, the sponsor for the Omnibus State Bill, would consent to a compromise. This compromise, so it was indicated, might take the form of the admission of the above-named four Territories as two States, Arizona being united with New Mexico, and Oklahoma with Indian Territory. In this way unquestionably some objections of the opponents of the bill would be met. On the other hand, new and very serious objections would be raised. In the first place, whereas the admission of the separate Territories could not be altogether a partisan measure, the combination would be far more certainly so. Republican dominance would seem to be assured, at least for the present. For this reason the Democratic supporters of Senator Quay have not responded gladly to the proposal. Furthermore, "the string attached" to the compromise is a promise that Arizona should be granted admission as a separate State as soon as its population reaches 300,000. Such a promise is perilously like an attempt to tie the hands of future sessions of Congress. When the time for the admission of Arizona comes, the question ought to be decided upon contemporaneous conditions and not upon the anticipations of Congressmen of other times. Opposition on this ground is sure to be developed. Most significant of all, however, is that opposition, stimulated by the proposed compromise, which is grounded on Mormon influence in New Mexico and Arizona. The testimony on this subject was most pronounced and most serious. This testimony was given by Democratic Senators from Utah, Idaho, and Colorado, and was to the effect that no Mormon would run for political office without the consent of the First Presidency of the "Church." Although this testimony was given in part to show that polygamists could be eliminated from politics by the authority of this huge religio-political machine, it was, as Senator Hale remarked, interesting, valuable, and startling, through bringing to light "the conditions that obtain where the Mormon Church has secured its lodgment." Last week's debate was useful if for no other reason than because it made clear that vigorous opposition to the Omnibus Statehood Bill, even in compromise form, should be continued.

❀

The Anti-Trust Bills

Without debate the Senate accepted the Elkins amendment to the Department of Commerce Bill, embodying that measure of trust regulation acceptable to the larger trusts; and with hardly more than a day's debate the House adopted the Littlefield bill, embodying a larger measure of Government control for monopolies and attempts to secure monopoly. We have been unable to secure from its author the text of the Elkins bill. The Littlefield bill as finally reported by the Judiciary Committee and passed by the House is less radical than the measure as introduced. It does not penalize the over-capitalization of trusts, although it provides for a pretty searching public examination of their affairs. In explanation of the change made, Mr. Littlefield said in the debate that to penalize over-capitalization might produce a panic, but that to require publicity would be to acquaint the people with the facts, and the evils of over-capitalization would gradually be corrected. Apart from the publicity provisions, the most important clause in the act is Section 6, providing that no corporation receiving

rebates or attempting to monopolize business in any locality by discrimination in prices "shall use either directly or indirectly any of the facilities or instrumentalities of inter-State commerce" for the purpose of facilitating its business "with such intent." This section is supplemented by the one following, which prohibits inter-State railroads from knowingly transporting goods produced or sold in violation of the pending act or the Sherman Anti-Trust Act of 1890. In the debate upon the bill Chairman Jenkins, of the Judiciary Committee, declared his belief that Section 6 was unconstitutional, and that the control of Congress over commerce was limited to distinctively inter-State transactions and did not reach within the territory of any State. The bill, however, as the majority of the Committee point out in their report, does not assume that Congress has the power directly to prohibit attempts at monopoly within any State. Any State may charter all the monopolies it pleases to serve its own people. The bill merely says to the monopolies, "'While we cannot control your illegal act within the State, you shall not use the instrumentalities of inter-State commerce in aid thereof.'" In reply to Democratic questioning, even Chairman Jenkins admitted that the taxing power of the Government reached everywhere and might be invoked to suppress undesirable corporations, just as it has already been used to suppress the note issues of State banks. The Democratic attacks upon the bill were practically limited to its alleged sins of omission. The bill did not, it was said, contain any provision to prevent monopoly extortion by removing the tariff from monopoly products, it did not aim to prevent monopoly by invoking the tax powers or the bankruptcy powers of the National Government, and it did not make the corporations amenable to the local courts as individuals were. "The Republican party," said Mr. De Armond, of Missouri, "will go far enough to satisfy the people that it seeks to do something for the people's good, but not far enough to hurt the people's enemy." The country, however, will congratulate itself if it secures the enactment into law of as good a measure as the Littlefield bill. Fortunately, the Department of Commerce Bill as amended in conference at the instance of Senator Nelson contains provisions for publicity which are considered of the highest importance by friends of trust regulation, and which keep the two houses from being so far apart in their present attitude as they seemed a fortnight ago. There is therefore reason to believe that some measure will be agreed upon by both houses embodying practically all of the provisions recommended by Attorney-General Knox.

The Naval Bill

"If you look at the navy in the right way, it is the rate of insurance that the country pays in order to get prompt and punctual delivery of its water-bound commerce. If the navy isn't for the rate of insurance and isn't for defense, then it is odious." These true words were spoken last week by Admiral Lord Charles Beresford at the dinner of the Pilgrims in New York City; and they will find an answering echo everywhere. If the object of the United States in increasing and strengthening the navy were to establish international political rivalry with other countries (in addition to the commendable commercial rivalry already established), then the policy of such an increase would be wrong; but if the necessity of policing the ocean is more and more evident, then there should be a corresponding augmentation of our navy. In other words, the spirit which should animate the officers and men of the navy, the legislators in Congress, and American citizens in general, should be a spirit of construction, not of destruction. Our navy exists not only for the defense of our interests, but also, in properly defending them, to build up, to preserve, and to cement international friendliness, not to destroy it. It is in this spirit, we believe, that the House Committee on Naval Affairs has completed a bill which is now ready for action by Congress. The bill carries appropriations aggregating $78,000,000, $30,000,000 of which is for new construction. No provision is made for submarine boats. The new construction comprises three battle-ships, one armored cruiser, two steel training-ships, and one wooden brig. Perhaps the most notable feature, however, is a proposition to double the number of cadets at Annapolis; the limit of maintenance of the Academy

is also increased from $8,000,000 to $10,000,000, and ten additional civilian officers are authorized. Other features comprise the establishment of a naval station on the Great Lakes, and an increase of the Marine Corps by 800 men and 65 officers; last year this corps was increased by a similar number. It is probable that any opposition to this programme will be greatly diminished, as sentiment among Senators and Representatives on the subject of naval increase has undergone a radical change since the present Venezuelan difficulty arose and our duties as to South America have been under discussion.

❀

The Senate and Mr. Byrne We are glad to record that the Senate Committee has refused to recommend the confirmation of Mr. Byrne as United States District Attorney for Delaware. There were three grounds of opposition to his appointment: (1) That he was an Addicks man, and his appointment would be regarded as distinctly an indorsement of the Addicks faction; (2) that his accepting a nomination against the Regular Republican nomination, and by so doing dividing the Republican vote and so insuring the Republican defeat in the Congressional election, was an act distinctly disloyal to the Republican party; (3) that his previous record as United States District Attorney was not such as to give promise of his efficient conduct of this office, and his appointment was not approved by the best legal talent in the State. It is possible that a fight may be made in the Senate to confirm his appointment in spite of the report of the Committee; but, in our judgment, the best thing the friends and supporters of the President can do is to vote to confirm the action of the Committee, and so open the way for the President, by a new appointment, to correct the most serious, if not indeed the only serious, mistake that he has thus far made in the always difficult task of Federal appointments. In view of the opposition to Mr. Byrne, of the National opposition to Mr. Addicks whom he represents, and of the revelations concerning Mr. Addicks's methods, of which Mr. Byrne could hardly have been ignorant, we cannot but think that the President would do both the wise and strong thing were he to withdraw the nomination without waiting for the final action of the Senate.

❀

The Addicks Withdrawal Mr. Addicks last Thursday made an announcement to his supporters in the Delaware Legislature—known as the Union Republicans—in which he declared publicly his withdrawal as a candidate before the Legislature for the office of United States Senator. The withdrawal was made, however, upon the express condition that a Republican caucus should be held, "to be participated in by all of the Republican members of the General Assembly, and the selection of two candidates for the Senate of the United States by majority rule of said caucus." This withdrawal of Mr. Addicks from the Senatorial contest in Delaware ought to mislead no one who is familiar with the man or his methods, and, we are glad to say, has not misled those faithful citizens of the State who, representing its best sentiment, have been bravely and persistently, and so far successfully, fighting Mr. Addicks for fourteen years. It is believed by those who thoroughly know the political situation in Delaware that the Addicks withdrawal is a shrewd move on his part to offset the opposition to him in the United States Senate indicated by the unfavorable report in the Byrne case. Mr. Addicks is justifiably suspected of hoping to pose in the eyes of Republicans in the United States Senate as having offered a sacrifice of his own personal aspirations for the sake of party unity and party success. The United States Senators, to whom he is making this appeal, are not children in politics to be deceived by any such stage-play. As Mr. Kennan shows in this week's Outlook, Mr. Addicks has betrayed the regular Republican nominations in Delaware whenever it suited his purpose and pleasure to "knife" the candidates. On this ground alone—aside from his personal character—we should suppose that sincere and honest believers in party loyalty like Senator Hanna would vigorously oppose him. But apparently a million-dollar "mugwump," who is a "mugwump" for personal ambition, is not so bad from the partisan point of view as the honest but mistaken "mugwump" who, without a corruption fund at

his command, opposes party nominations on what he thinks are moral grounds.

❀

What It Means

The condition that the Regular Republicans unite with the Addicks Republicans in a joint caucus, electing two Senators by a majority vote, of course means that two Senators of Mr. Addicks's choice could be, and undoubtedly would be, elected. One of these Senatorial dummies could resign his seat on account of—let us say—a sudden illness. Governor Hunn, who is an ardent supporter of Mr. Addicks, could then appoint Mr. Addicks for the unexpired term. In case of such appointment, the corruption employed by him in preceding elections would constitute no legitimate ground for his rejection by the Senate, since that corruption would not have directly contributed to his appointment. We think, however, that such a "vindication" would not satisfy Mr. Addicks, and that he would pursue the shrewder plan of permitting the two Addicks Senators to fill out their terms. As Senators they would control the Federal patronage in Delaware, and by its means could immensely strengthen Mr. Addicks's political position, even without the aid of corruption, and he could thus practically assure himself of election in 1905. Apart, however, from this probable issue to Mr. Addicks's proposal, it ought to be promptly rejected by the anti-Addicks forces in Delaware, for their object should be the overthrow not merely of Mr. Addicks but of all that he represents. Mr. Addicks, in his own statement issued last week in Delaware, says that he has been a candidate for Senatorial election for fourteen years. Mr. Kennan in his article in this week's Outlook shows that fourteen years ago Mr. Addicks came into the State practically unknown. He had never held an office. He had not been so much as chairman of the County Committee. A practical stranger, without any political connection whatever with either party, he began at once, with what seemed then to his contemporaries and still seems to us unparalleled effrontery, to work for the Delaware Senatorship. What would Senator Hanna say as to party regularity if a Pennsylvanian, unknown in Ohio, never having held the simplest political office in that State, practically not being a voter, and actually having his domicile in Pennsylvania, should announce to the party leaders that he was candidate for the United States Senatorship from Ohio? "Practical" politicians are fond of poking fun—sometimes, we must admit, justifiable fun—at the visionary projects of the reformers. If any one can point out to us a more visionary project than that of Mr. Addicks when it was first promulgated in 1889, we should be glad to know about it; there is not a practical politician in any State in the Union who would not to-day ridicule such a scheme as he initiated fourteen years ago, if it were not for the corruption fund with which he has contaminated Delaware and is likely to contaminate the entire country through the United States Senate, unless he is thwarted. We leave our readers to draw their own conclusions as to the ethical and moral questions involved in Mr. Addicks's career as vividly portrayed by Mr. Kennan, and content ourselves at this moment with asking the leaders of the Republican party of the United States whether, on mere grounds of political expediency, regularity, and loyalty, he ought not to be summarily rejected as a traitor to the party, its officers, and its candidates.

❀

The Venezuelan Situation

The net result of last week's earnest and sometimes heated discussion over the exchange of offers for the immediate arrangement of the claims of the allies against Venezuela was a proposition from the allies to President Roosevelt that he should act as arbitrator on the question of giving preferential treatment to the claims of the allies as against those of other nations; but the President, after considering the matter carefully, declined courteously to assume this position, and intimated to the diplomats that their best course was to refer this point to the Hague Tribunal. At the end of the week the prospect seemed to be favorable to the adoption of the President's recommendations. It is hoped that within a few days protocols will be signed between the representatives of the nations concerned; that the blockade of Venezuelan ports will be raised; and that preparations will go forward for the submission of all matters

now in dispute to the Hague Tribunal. This course is one that may be heartily approved, not only as a fair and reasonable way of settling the controversy, but because it adds weight and standing to the Hague Tribunal as a permanent and recognized authority before which such matters may be placed almost as a matter of course. So far as there was any disagreeable feature in the negotiations last week, it appears to have grown out of the fact that Mr. Bowen (who, it must be remembered, acts purely and solely as the representative of Venezuela), in rejecting the proposition of the allies that thirty per cent. of the customs duty be reserved for the allies' claims and ten per cent. for the claims of other nations, expressed to the British Ambassador his surprise that Great Britain should be willing to adopt a course which Mr. Bowen seemed to think would result in a long continuance of the alliance between Germany and Great Britain; properly, as it seems to us, Mr. Herbert considered this out of order and showed his resentment. The unpleasant incident, however, was quickly adjusted, and there seems to be no doubt that the accredited representative of Venezuela can now act with the diplomatic representatives of the allies under satisfactory conditions.

❀

Vermont for Local Option

The country as well as the State is to be congratulated on the election in Vermont, in which, by a small majority, prohibition has been voted down and the policy of high license and local option has been substituted. Small as is the majority, it is about the same as that by which prohibition was established in 1852. It is reported that the rural vote was in favor of retaining, and the town vote for the change. There is no one method of legal enactment respecting the sale of liquor which works equally well in all communities; but, in our judgment, a wide experience, extending over many States and for many years, has proved that the policy of State prohibition is morally disadvantageous to the community. It does to some extent close the open saloons, but it promotes secret drinking-places; excites the spirit of lawlessness; leads communities to think that they are virtuous because they have incorporated virtue in a statute; tends to public corruption and blackmail; and in these and other ways pays far too great a price for what is too often the appearance rather than the reality of total abstinence. A minimum license fee fixed by statute, with local option by towns and villages, and possibly—though this experiment has yet to be tried—by wards in the larger cities, gives far more promise of practical results than prohibition. It has been suggested that the Vermont Legislature may direct that the sums received from excise fees shall be expended in temperance coffee-houses, reading-rooms, homes and cures for inebriates, and the like. There are two advantages in this scheme: one that it will prevent local communities from voting for license in order to reduce their general taxes, the other that it will tend to attract from the saloons, where they exist, by setting up alongside of the saloon counter-attractions. We hope that this experiment may have a trial.

❀

Governor Pennypacker's Independence

Judge Pennypacker, who was inaugurated Governor of Pennsylvania on January 20, has succeeded thus far in stirring up no small amount of trouble in Pennsylvania, mainly because he realizes and acts upon the realization that he is Governor of the State and not of the Republican organization or influential politicians. This is in striking and refreshing contrast to the conduct of his predecessor, who did nothing against the wishes of the "organization," and who left office with a record of subserviency to political and corporate interests unequaled in the annals of the State. Governor Pennypacker started out by appointing as his Attorney-General Hampton L. Carson, who three years ago argued against Mr. Quay's admission to the United States Senate on the strength of Governor Stone's appointment. Mr. Carson is not only a lawyer of prominence and ability, but has a record for independence that makes him all the more objectionable to the politicians. Then the Governor refused to reappoint the Secretary of the Commonwealth and one or two other prominent officials because of their identification with the notorious Stone administration. On the other

hand, he has refrained from making sweeping removals of the subordinates. The Harrisburg "Patriot" quotes him to the effect that he has "no notion of making wholesale removals or of disturbing faithful employees." This is a departure from custom, as at the beginning of each new administration, whether Republican or Democratic, there have been a large number of changes made purely for partisan or factional reasons. Governor Pennypacker was at one time actively identified with the Civil Service Reform movement, and thus far he has shown himself to be true to his early advocacy. As the Philadelphia "Record" (a Democratic paper) puts it, "Governor Pennypacker's recognition of Civil Service Reform is a departure in Pennsylvania from which there is not likely to be a reaction." Moreover, the Governor entertains what has been for some years an unpopular belief—the opinion that Constitutional mandates should be obeyed. The present Constitution provides that there shall be a legislative reapportionment every ten years (just after the taking of the Federal Census), but there has been no reapportionment in Pennsylvania since 1884. So the Governor, much to the surprise of the politicians, has insisted that the subject must be taken up and acted upon. Then, again, he has returned all railroad passes, and on the third day after taking the oath of office refused to approve certain charters because the character and purposes of the proposed corporations were not definitely disclosed. Both of these proceedings are almost if not entirely unique in the annals of the State. And yet, with all this exhibition of independence, which is undoubtedly genuine, and this sincere regard for his oath of office, Governor Pennypacker has not abated one iota his admiration of Senator Quay!

❀

The Coal Situation

The coal famine has been sensibly relieved during the past fortnight by the increased activity at the mines and on the railroads, by the decreased domestic consumption due to the milder weather, and also by the foreign purchases of coal. These last do not aggregate any great amount in comparison with the total quantity of coal consumed, but they have helped materially to lessen the shortage which created the panic. For instance, the New York, New Haven, and Hartford Railroad engaged from abroad over one hundred and fifty thousand tons of coal—a small amount compared with the two hundred and fifty million or more tons consumed by the country, yet sufficient to furnish nearly a month's supply of coal to all the homes in Connecticut. Similarly, in Montana one of the great railroads brought in coal supplies from Canada, and these foreign purchases have sensibly relieved the local famine and more sensibly relieved the local fear of famine. Of course all such purchases have been facilitated by the repeal of the duty on coal. At the Strike Commission's hearings at Scranton, Judge Gray sharply criticised the union for restricting production by limiting the hours of labor of its members, and Mr. Darrow, the miners' attorney, sharply criticised the companies for restricting production by agreeing among themselves as to how much coal each should put upon the market. Judge Gray seems to have defended the coal companies by urging that the supply of coal ought not to be wastefully used, but should be husbanded for future generations. Mr. Darrow said that the coal supply was just as well husbanded by the efforts of men to prevent excessive hours of toil. Most of the controversies last week were over wages, the miners introducing testimony to show that the company books did not contain the names of many of the mine workers who were in the employ of the contract miners. Apparently there is no way of getting at the average wages except by getting the total wages paid by all the companies, and dividing it by the number of mine workers in the anthracite district, as shown by the census returns. In the bituminous district there is now some fear of future trouble. The miners insist upon still another advance in wages to correspond with the advancing price of coal. The operators seem disposed to grant ten per cent., but they will have public sympathy in refusing to grant more. The soft-coal miners have obtained something like a forty per cent. advance during the past few years, and while their condition was undoubtedly hard before these advances took place, they seem now to be fairly

well paid. Up to a certain point higher wages mean more efficient labor and better machinery, so that the cost of production is not sensibly increased, but this point is easily passed. The public might easily be not only the chief but the only loser from an agreement between the organized operators and organized operatives to advance wages and prices at the same time. The public is now in greater danger from extortion than the miners are of oppression.

❀

The Waterbury Rioting The Waterbury trolley strike, which was the occasion of a riot calling for the presence of State troops to preserve order, grew out of the discharge of the president of the trolley employees' union, and two other members thereof, for entering a saloon in their uniforms. There is no doubt that the offense was in violation of a rule of the company, and of an eminently desirable rule. The union, however, regarded the enforcement of the rule in the case of these three men as an act of hostility toward their union. Unionism, they claimed, was the cause, and tippling merely the pretext, for the company's action. They therefore struck, and demanded that the company should arbitrate the matter in dispute, as the condition of their return to work. The company, which is not merely a local one, but extends its lines throughout the State, refused to accept the proposal, and engaged non-union men, chiefly from other cities, to man its cars. In Waterbury itself four fifths of the people sympathized with remarkable uniformity with the strikers, and even among the well-to-do the corporation, owned chiefly by non-resident capitalists, had no more than the usual popularity of absentee landlords. As a result it may be said that the city was on the side of the strikers during the first week of the tie-up. The strikers themselves promoted this public sympathy by issuing a proclamation against disorder, and by wearing badges bearing the words: "Friends, use no violence. It hurts our cause." On Saturday night, however, when the streets were thronged, a car manned by non-union men was attacked, and before midnight the city was the scene of wild disorder. As the Waterbury "Evening American" of the following Monday expressed it, the crowd, which "was in appearance rather well dressed, intelligent, American," had become a "brutalized, cruel, animal mob, which craved destruction and felt fierce joy in the sufferings of a human being under its boot-heels." Among the persons arrested for rioting that night, not one, according to the police court reports, was a striker; but the strikers did not earnestly work or even speak to hold back the mob. The Governor of the State was appealed to by the sheriff to send a small number of troops, and he sent a regiment. The number and the handling of these troops was the occasion of local criticism, but general order was preserved during the next five days, and the stoning of cars did not again become at all epidemic until the troops were withdrawn on Friday of last week. That all of this disorder should have occurred in a city of the character and intelligence of Waterbury indicates that the industrial war spirit is by no means confined to the immigrant or ignorant working classes. Wherever the employing corporation is a monopoly, the working classes seem to take *en masse* the side of the strikers, and to condone almost any means employed to worst the monopoly. The way to reach this growing evil is to extend the legal means of requiring employers and their employees to deal fairly with each other and with the public, and at the same time, both by moral suasion and by legal prosecutions, to teach all classes that the law must and shall be upheld.

❀

Freight Congestion Not only has New York City outgrown its transportation facilities, but the whole country is now suffering from what might be termed a trackage, locomotive, and car famine. For many weeks, east and west of Pittsburg, the accumulation of freight has been so remarkable as to lead to a decision to build an entirely new line eastward from that point; and has also emphasized the demand of most Pittsburg citizens for an entrance of the Wabash Railway into their city. New York and other places in the East have been suffering seriously because of the lack of coal, and some of the suffering is due to this breakdown in transportation facilities. There is now some slight dan-

ger that the East may yet suffer from the lack of another necessary of life. While in nearly every State there are flour-mills capable of supplying all of that commodity needed for some time to come, the wholesale price of flour has already advanced a little because of the notably diminishing stock on hand, due to the fact that the Western roads are unable to handle the great quantity of freight which they have contracted to carry. Usually there are five hundred thousand barrels of flour on hand in New York City; but at this writing there are only one hundred and fifty thousand. Fortunately, there has been hardly any complaint from the bakers as yet; the barrel price has not been raised sufficiently to affect them very seriously. The result of existing conditions as to trackage, locomotives, and cars should mean a great impetus throughout 1903 in railway-building and in the industries which have to do with railway equipment.

❀

The Crisis in Macedonia

Last week the financial and commercial exchanges of the European capitals were not more disturbed by Venezuelan than by Macedonian rumors. A war-cloud on account of the Balkan question has been a well-nigh perennial thing, and the world at large has fallen into the habit of regarding it with indifference. When, during the past few weeks, we have read, therefore, that a formidable insurrection against the Turks was expected in the early spring, we have remembered that similar predictions have been made every year, and hence have not been unduly disquieted. It should be noted, nevertheless, that not since the preliminary stages of the Russo-Turkish War in 1887 have these predictions been made with equal confidence. The ultimate cause is, of course, the atrocious misgovernment of the Sultan, but the proximate cause is the outrageous propaganda of the Bulgarian Macedonian Committee, who instigate a kind of patriot-brigandage—blackmail, incendiarism, mosque desecration, murder. The professed object of the Committee is to raise funds, to acquire proselytes, to destroy the most influential members of the rival races in Macedonia, especially the Greeks, and to instigate violence and reprisals by the Turks. For this purpose the entire province has been divided into a number of districts, each being under the control of a secret local committee, consisting mainly of schoolmasters, doctors, and Bulgarian priests. In districts where there are no revolutionary adherents the natives have been stirred up and armed bands formed by persuasion, intimidation, or the spectacle of murder. In view of this Bulgarian propaganda, the statement of the Bulgarian Government last week was of interest. In the course of a debate in the Sobranje (or Parliament) the Prime Minister said that if the circulars of the Macedonian Committee overstepped legal limits his Government would certainly take action. The Premier knows as well as any one, however, that he has no power to prevent Bulgarians from crossing the frontier and making common cause with genuine Macedonian revolutionists. Indeed, we can hardly dissociate the policy of the Macedonian Committee from the policy of Prince Ferdinand; the Committee is all-powerful in Bulgaria, and the present unworthy occupant of the throne there dares not go counter to its propaganda. The Committee has undoubtedly made it well worth his while not to go counter to it; he expects to see the province of Macedonia added to his principality, and the whole erected into an independent kingdom.

❀

The Attitude of Russia

A month ago, in view of the events in Macedonia, the Russian and Austrian Foreign Ministers completed an agreement regarding reforms in that province, and proposed to submit the agreement to the Sultan. The plan was supposed to center about the appointment of a Christian Governor for Macedonia, with practically full powers. This project would undoubtedly be regarded by Abdul Hamid with the apathy shown more than once to the efforts not only of two but of all the Powers of Europe. Instead of strengthening the hands of right-thinking Bulgarians, the plan has really strengthened the hands of the lawless Macedonian Committee, because it confirmed the agitators in their belief that Russia at least will really aid any serious effort to liberate Macedonia. The Russian idea in this would, of course, be not so much to liberate as to Slavonize

Macedonia, and thus bring the greatest land Power in Europe and Asia one step nearer an occupation of Constantinople. The seizure of the capital of Turkey by Russia would once have been the signal of European conflagration; it is extremely doubtful whether it now would provoke even a small blaze, since the Powers might find ample compensation in other directions—Italy in Albania, Austria at Salonica, Germany in Asia Minor, France in Palestine, and England in northeast Africa. The Macedonian agitators have been further confirmed in their conviction that outside aid will shortly be forthcoming—first, by the open inquiries of the Russian Admiralty as to the troop-carrying capacity of the Black Sea squadron of transports, the volunteer fleet of cruisers, and the vessels of the various Russian navigation companies; secondly, by the half-mobilization of Austro-Hungarian regiments in Transylvania. Perhaps the London "Times" does not exaggerate when it says: "Every European chancellery is aware that there is most imminent danger of a revolt in Macedonia on a totally different scale from the usual disturbances, and an opening up of questions that may lead to a struggle the limits and issues of which a wise man will not pretend to forecast."

❀

Morocco Last week, in a three-hour battle, the Sultan of Morocco inflicted a crushing defeat upon the Pretender to the throne. The Sultan's success was principally due to the co-operation at a critical moment of a tribe whose defection from the rebels the Sultan had previously purchased. The Pretender's camp, assailed in the front by the Imperial army, was suddenly assailed in the rear by this tribe. The slaughter was great, and the remnants of the rebel army fled. It is not known whether the Pretender fled with them or was killed. At all events, the victory of Mulai Abdul Aziz over him is one which should be welcomed by all friends of civilization, since, as is the case with the Chinese Emperor, the Sultan of Morocco represents a certain amount of reform and progress; the Pretender's forces, like the Boxers, represent reaction and fanaticism. The very enlightenment of the ruler of Morocco was the cause of the late rebellion. The thirty-sixth lineal descendant, as he is, from that Ali who was the uncle and son-in-law of the prophet Mahomet, the present Sultan is also the son of a Circassian mother, and would seem to inherit some of the virtues belonging to her northern blood. He has endeavored to collect taxes honestly; he has allowed the arrest of criminals who had taken refuge in the porches of mosques; last, but not least, he sometimes dresses in semi-European costume, and actually rides in a motor-car! These things have helped the Pretender's cause; and he worked upon the bigoted sects among the Moors who have always been opposed to any kind of reform. If he had succeeded in battle, the whole country might have fallen back into barbarism; as it is, we may expect that Morocco, whether it comes into the sphere of influence of a particular European power or not, will show a few more signs of civilization. The ancient industries—weaving, leatherwork, cutlery, etc.—which once made the name Moroccan a thing to conjure with, may yet be revived, although Switzerland, France, Russia, and Germany have now succeeded to much of those manufactures. The very name of the capital, Fez, is still a household word wherever the tarbush or turban is worn, although long since the Oriental manufacture of fezes has been removed to Tunis, while the cheap imitation, so often seen, comes from Switzerland.

❀

The Federation of Churches The third Annual Conference of the National Federation of Churches and Christian Workers was held at the Bible House, New York, February 3. The reports presented showed a gratifying though not rapid progress of the movement. Following the example set by Nebraska last October, California has now organized, and was represented by Dr. J. R. McLean, President of Pacific Theological Seminary. Among the subjects discussed and favorably received, one of much practical importance was a new "plan of interdenominational affiliation"—new only in its broad application of a practice introduced some time since in colleges. According to this plan, a Presbyterian church member resident for

a time in a community where no Presbyterian church exists, and unwilling to dissolve relationship with his own church, might be received as an "associate member" by the Methodist or Baptist church of the vicinage, on presentation of a letter from his Presbyterian pastor accrediting him to Christian fellowship. Should he move on to another neighborhood, the same letter, indorsed by the pastor of the church of his temporary sojourn, would entitle him to similar recognition there. Should he finally return to his old home church, this letter, with its indorsements, would exhibit his record during absence. This plan has been unanimously recommended by the Evangelical Alliance of Pennsylvania as desirable on account of the migratory life of many people, and the losses thereby suffered in all churches. It is also urged as a desirable strengthening of the bonds of interdenominational fellowship. The sessions of the Conference were followed by a social evening at the St. Denis Hotel. In the course of an after-dinner address, Dr. Tomkins, the rector of Holy Trinity, Philadelphia, emphatically placed the responsibility for the disgraceful municipal conditions existing in that city on the disunity of Christian people and their ministers.

❀

A Church Building Jubilee

The Congregational Church Building Society, organized in May, 1833, is soon to celebrate its jubilee year. Historically this has some importance in the annals of American Congregationalism. Symptoms of alienation had appeared between the older churches of New England and the newer churches westward. Charges of innovation upon the standards of doctrine and polity were tending to the estrangement of the more conservative East from the more progressive West. It was even alleged that Congregationalism would not bear transplanting from its native hills to the prairies. Such conditions occasioned the assembling at Albany, in 1852, of the first general council held by the Congregational churches since the Cambridge "Synod" in 1646. The outcome was their drawing together into a closer union among themselves; also the discontinuance of the historic "plan of union" for home missionary purposes with Presbyterians—a plan by which Congregationalism had lost in half a century two thousand churches, and Presbyterianism had gained its "new school" element, with the consequent schism and controversy that was healed only a year ago. In pledge of the denominational harmony established at Albany, a fund of over sixty thousand dollars was formed to aid feeble churches at the West to erect houses of worship, and the then significant name of "The American Congregational Union" (changed in 1892 to the present more descriptive name) was given to the Society organized as almoner. During the half-century over three and a half million dollars have been distributed in loans and grants in all parts of the country for the erection of churches and parsonages; a quarter of a million during the past year.

❀

The American Chapel at Berlin

Our readers will remember that about a year ago The Outlook printed Ambassador White's address at the laying of the corner-stone of the American Chapel in Berlin, and described the occasion as one of National as well as of religious interest. The minister of the Chapel, the Rev. Dr. James F. Dickie, by assiduous and well-directed labor, obtained the authorization for the building of a church, selected the site, and raised money enough to build a worthy edifice as a home for a church which for about twenty years has been a religious and social center for many thousands of American residents and visitors to Berlin. The building has been completed, or is nearing completion, and it is now urgently desired to provide an organ, church furniture, windows, and other requisites. It is also proposed to carry out an extremely commendable plan, one which cannot but be of immense utility, that of establishing in the church house a reading-room and library open under suitable regulations to all American and British students; the library, we understand, will largely consist of American and English works of reference, histories, biographies, and other works not readily obtained in the German libraries. Such a plan will obviously form a bond between the students and the church which would be of value in more ways than one. For these purposes

it is proposed by Dr. Dickie, who is now in this country, to raise a further fund of $10,000. No debt has been or will be incurred by the American Chapel. The object is one which appeals peculiarly to all Americans who have lived or studied in Berlin. We take pleasure in commending it cordially to the attention of our readers. Dr. Dickie may be addressed at the St. Denis Hotel in New York City.

❀

The Pandita Ramabai

The American Ramabai Association announces a radical change in the character of the Shâradâ Sadan, the school at Poona, India, founded and conducted by the Pandita Ramabai for high-caste Hindu girls, mostly, if not all, belonging to the unfortunate class of child widows. Ramabai, with the support of this Association, organized the Shâradâ Sadan some sixteen years ago as a strictly secular school. As in our public schools, no religious instruction was to be given there. Thus she hoped to obviate the interference of religious antipathies with her philanthropic effort to ameliorate the wretchedness of Hindu child widows. For some years the plan worked most successfully. But though no formal religious instruction was given, the influence of Ramabai's Christian character took inevitable effect upon her pupils. Then trouble began—accusations of broken faith, opposition, persecution. The result of a painful experience has been the abandonment of the secular character of the school. Henceforth, the Association announces, "it is to be, as regards religion, whatever Ramabai may determine"—such is the confidence reposed in her. The religious bitterness felt against her by neighboring Mohammedans has so imperiled the safety of both teachers and pupils at the Shâradâ Sadan that Ramabai has been compelled to remove it to Khedgaon. It has more than a hundred and twenty girls, all avowedly Christian, in a course of higher education. Besides these, many others, girls and women rescued from famine, are in the Mukti home and school, established in 1897 at Khedgaon. No Christian work in non-Christian lands appeals more strongly to American women. Donations may be sent to the Treasurer, Mr. Curtis Chipman, 222 Boylston Street, Boston.

Child Labor at the North

The Alabama committee which conducted the now successful agitation for a child labor law in that State seems to have lighted a fire which is burning brightly all over the Nation for the extirpation of this crying industrial abuse. The very week that the despatches announced the practical acceptance of the reform bill by the authoritative committee of the Alabama Legislature, a New York committee organized to agitate against the forms of child labor persisting in the metropolis issued a document stating that four Northern Governors had, within a week of one another, urged their Legislatures to pass new laws for the prohibition of child labor. In New York, at least, the men and women who have taken hold of the work of purifying local conditions are the very ones who co-operated most heartily in the work of the Southern committee in arousing a National sentiment against a supposedly sectional evil. Their "foreign missionary" effort did not spring from sectional self-righteousness or the willingness to forget wrongs near by in the thought of wrongs far off, but from a wholesome hatred of wrong wherever found. Their sympathy with the child victims of premature toil at the South only made them the more sensitive to kindred evils at home.

The New York committee began its work by an investigation into the extent to which child labor persists in New York City, and the legislative changes needed to make effective the suppression of the most serious evils. The first part of this week revealed conditions in New York City which Superintendent Maxwell, the head of the public school system, reasonably declares to be more nearly akin to child slavery than those which exist in the Southern cotton-mills. It was found that there are school-children who deliver milk from four o'clock in the morning until school-time. There are others, especially in the employ of bakeries and laundries, who deliver wares from six o'clock till eight in the morning, and from half-past three till seven at night. Some of these children are completely exhausted and dulled for their school work by the long hours of toil during play-time and sleep-time. Many of these children are

but twelve years old or less, and their employment is entirely legal, for the present child labor laws only cover work done *inside* of factories and stores. Even delivery companies are not subject to the restrictions of the child labor laws, and one company is found to employ all day children of thirteen, twelve, and even eleven. "They begin work," says the committee, "at seven in the morning and return to the office at the end of their last trip between nine and ten o'clock at night. On Friday and Saturday nights they work until midnight. If the packages are not delivered at midnight on Saturday, the children work on Sunday until the tasks of the previous day have been completed."

Similar evils—and even greater evils morally—have been exposed in the other street trades—among newsboys, bootblacks, messenger-boys, and peddlers. But they are by no means confined to these trades not yet under the scope of the child labor laws. In the factories and shops covered by these laws it was found that hundreds of children under fourteen are steadily employed in disregard of the law. The present laws require a certificate for each child employed, showing that it has reached the required age and attended school a required period. One East Side principal states that three out of five of the certificates brought to her for signature contain statements from parents regarding the child's age which she knows from the school records to be false. The committee proposes that the law be changed so as to require the parent to furnish corroboratory evidence as to the age of the child, and in general to make the signing of these certificates less of an empty form. It also proposes that the compulsory education laws and the child labor laws shall be made to fit into one another so as to support each other. At present the compulsory education law requires of children twelve years of age merely that they shall attend school eighty days, though they may not legally work in factories or stores until they are fourteen. The committee apparently proposes that school attendance be required until work for wages may be begun. It also asks that in New York—as now in Massachusetts, Connecticut, Ohio, Illinois, Michigan, Indiana, Wisconsin, and Minnesota—vacation work for children twelve years of age should be forbidden, and the children should have their vacations for the purpose for which vacations are granted. The committee finds that the earnings of little children are so petty that there are few cases where the need of the parent even colorably justifies the employment of the child. In these cases the committee suggests that direct aid to the parent is infinitely preferable to the sacrifice of the child. The parent's right to the child is less fundamental than the child's right to himself, and the child on reaching manhood has a right to himself not dulled and sapped of strength, but in the full vigor of body and mind.

❀

Henry L. Dawes

Henry Laurens Dawes, ex-Senator from Massachusetts, who died in his home in Pittsfield on Thursday of last week, was a representative man of New England birth and temper. The son of a farmer, he fitted himself for Yale College by studious use of the little leisure in his working life, and largely supported himself during his collegiate course. After graduation he taught school and read law at the same time; began the practice of his profession in Hampshire County in his native State in 1842; wrote editorials for local papers; entered the Legislature in 1848, and soon attracted attention as a skillful debater and indefatigable worker. In 1858 he entered Congress, where his tireless attention to public business, the rapidity with which he familiarized himself with the routine and procedure of Congress, and his thoroughgoing integrity soon brought him to the front. He was appointed Chairman of the Committee on Elections; and for ten years, during a period of the most bitter contests, his reports were recognized as documents of singular skill and convincing reasonableness. He became Chairman of the Committee on Appropriations, and was tireless in protecting the public treasury from extravagant grants. As Chairman of the Ways and Means Committee his unusual working qualities were drawn upon to the utmost; but in this position, as in every other, his fidelity and painstaking care were universally recognized. In 1869 he was candidate for the Speakership of the House, but withdrew in favor of Mr. Blaine. As Chairman of the Committee

on Appropriations he was conspicuous for courageous opposition to extravagant schemes of all kinds; and his services to the financial interests of the Nation, as well as to its moral interests, were of inestimable value during a very critical period. In 1875 he was elected to the United States Senate in succession to Charles Sumner, and served continuously in that body until he retired in 1893. He was appointed to the Appropriations Committee; but it was as Chairman of the Indian Committee, a position which he held for sixteen years, that he made his most distinctive mark in the Senate.

It is especially as a friend of the Indian race that Mr. Dawes will be known in the history of his country. Other services which he has rendered may be more important, but none other are so distinctive. To the West the Indian seemed at all times an obstruction to civilization, and was not infrequently a peril to life and property and home. The East, knowing him chiefly through Cooper's novels and Longfellow's Hiawatha, thought of him as a mythical hero of romance, having little more connection with modern American life than a Greek demigod or a mediæval knight. Senator Dawes, bringing to the Indian problem the uncompromising conscience and the humanitarian spirit of the Puritan, brought to it also the New England practical common sense, and set for himself the seemingly impossible task of making the West see that the Indian was not a wild beast and the East see that he was not a creature of the imagination; and so of convincing both that he was to be treated on principles of reason and common sense, as well as on principles of justice and common honesty, as an imperfectly developed man. As Chairman of the Indian Committee of the Senate he devoted himself to this always difficult and at first wholly thankless task. For the East had no inclination to be disillusionized and the West no inclination to be reformed; and both were practically agreed that the Indian could not be civilized, the West because he was too brutal, the East because he was too charmingly poetical. In 1892, in an address delivered in Hartford, Senator Dawes described in a sentence the new Indian policy: "Having tried every other means with the Indian, the Nation, as a last resort, resolved to try the experiment of making something out of him." It is not unjust to others, it is only just to Senator Dawes, to say that he was the father of this policy, and has done more than any other man in the United States, first, to secure for it a recognition from the Government, second, to embody it in practical legislation. It is not necessary here to trace the successive steps of a process which has necessarily changed in its methods, but has been unchanging in the purpose which has animated and directed it. The apparent inconsistencies of the process are really the harmonies of a development each step of which prepared for the following stage: first, scrupulous honor in observing treaties with the Indian, and honesty in payment of his promised rations and supplies; next, the partial substitution of schools for supplies, and of books for beef; then the discontinuance of treaties made with the Indian races as though they were foreign nations; then the gradual obliteration of reservation lines and the progressive emancipation of the Indian from the limitations and restraints necessary during the period of his pupilage; lastly, his full citizenship under the law, and the recognition of his equal rights as a man of whom something had been made. In this whole process of the last quarter of a century, Senator Dawes had to bear with patience alike the slowness of men who thought that nothing could be made of the Indian and the hurry of men who wanted to treat him at the start as though he were already made. To the very last his patience was not exhausted nor his enthusiasm abated, and if he did not live to see the wards of the Nation all converted into citizens, he educated others to carry on his work, who will not suffer what he began to be abandoned until it is finished and the National honor is secured by the protetion of the North American Indians in all their civil and political rights.

Mr. Dawes was twice offered a position on the Supreme Court of Massachusetts, and twice declined. More, probably, than any other honor that came to him he valued the unusual confidence, not only of the men of his own constituency, but men of all parties, who knew his work, recognized his stainless integrity during a period of the greatest political corruption

known in the history of the country, and his tireless devotion to public duty. The last ten years of his life were spent in quiet in his delightful home at Pittsfield, Mass., in one of the most beautiful towns in the country, in a community of unusual intelligence, where his declining years were sweetened, not only by unusual devotion in his own family, but by constant expression of the regard and affection of his neighbors and of the Commonwealth. He was a public man who, in an unusual sense, deserves the great commendation, "Well done. good and faithful servant."

❀

The New Religious Experience

There is not only a New Theology, of which much has been said, but also a new religious experience, of which very little has been said. But the question whether religious experience is becoming more spiritual is far more important than the question whether our thought about religious experience is becoming more scientifically accurate. Faith in God and in the divine law and life remains; but it is not the same faith. Is it richer or poorer? stronger or weaker? clearer or more dim?

> "Let knowledge grow from more to more,
> But more of reverence in us dwell;
> That mind and soul according well
> May make one music as before,
> But vaster."

The knowledge has grown; or so at least many of us think. But does more of reverence in us dwell? The music of mind and soul is in better accord. But is it vaster? The Rev. Edward H. Byington, D.D., of Beverly, Massachusetts, has recently preached a sermon on this general theme, based on a tabulated contrast, recently printed in The Outlook, between the New and the Old Theology. Acknowledging our indebtedness to this sermon, which we should be glad to see published in full in pamphlet form, we to some extent follow here the lines he suggests, but without reporting him; nor must our readers hold him responsible for our interpretation of the New Experience.

The aspect of prayer is changing. The New Experience does not look out and up to a King upon a great white throne, nor back to a Divine Man by the Sea of Galilee; it looks within to the God who tabernacles with men. Our prayers are less an asking for things and more a communion of spirit with spirit; the answers we look for are less external gifts bestowed and more spiritual life imparted; we do not so much seek succor from life's battles and burdens as courage for the first and patience for the second. Thus prayer becomes hardly distinguishable from meditation; it is listening to God perhaps even more than speaking to him; it is compliance with the Psalmist's counsel, "Commune with your own heart upon the bed, and be still." It is therefore less a matter for appointed times and occasions; more a habit than an act, more an atmosphere than either. It is consequently more difficult to give to it outward and formal expression except in liturgies; it is more private, less public, more unuttered, less expressed, more a life of the subconscious self, less a conscious and deliberate speech. It loses in clearness, definiteness, precision; but it gains in intimacy, closeness, familiarity.

Closely related to this change in the experience of prayer is a change in the soul's quest after God. With a belief in the Universal Presence and the Divine Order comes a consciousness that the devout soul is not to ascend into heaven to bring Christ down, nor to descend into the depth to bring Christ up, but is to find the Word, that is, the speaking, self-revealing God, nigh, even in the heart. If it is more difficult to believe in miracles, it is less important. If the extraordinary manifestations of God recounted in ancient history appear less credible, the ordinary manifestations of God in current life appear more real. He is seen in American history not less than in Hebrew history, in the life of to-day not less than in the life of long ago. All so-called natural phenomena appear not less supernatural than the so-called miraculous: the change of water into wine by the vineyard not less than the similar change at the wedding feast; the daily feeding of five thousand out of a few seed cast into the earth not less than the historic feeding of five thousand out of two loaves and five small fishes. So the ordinary

aspirations and inspirations of the soul appear, not the summons of our better self, but the Voice of Him who speaks within us. Revivals are infrequent, evangelists are not in demand, religious excitement is looked on with suspicion; development of a higher life out of the lower, as the flower and the fruit from the soil, seems normal and natural. We therefore believe less in the aphorism, "The kingdom of heaven suffereth violence, and the violent take it by force," and more in the parable which compares the kingdom of God to a seed which springs and grows up man knoweth not how. Religious activity is therefore less intense, less aggressive, less concentrated, but also less confined to special places, institutions, and epochs. There are fewer religious excitements and more moral and civic reform conventions, fewer prayer-meetings and more college settlements—many of which, however, entirely ignore the needs of the spiritual life. Religious life is less emotional but more ethical, less intensified but more diffused. It has perhaps lost something in manifestation of power, but it has gained something in quiet, practical efficiency. It may seem less evidently divine, but it is more evidently human.

With these changes has come another which is more than a change of opinion. The new religious experience looks for its final authority to the Voice within. The secret of whatever authority it recognizes in either Church or Bible is in the response which the soul makes to the word which they utter. Ecclesiastical authority is no longer recognized by the New Experience. It is frankly disowned and denied. The "Cloth" has lost its power; the "Pulpit" has lost its power; it is only the man who wears the cloth and stands in the pulpit who has power. And he has power only as he is able to evoke a deep response from the souls of his congregation. The private recognizes the authority of the captain because he is a superior; the pupil recognizes the authority of the teacher because he is an expert. The authority of the preacher is neither that of an official superior nor that of a scientific expert; he has authority only as he is able to awaken in the soul of the hearer an authoritative voice, to put the conscience of the hearer into the imperative mood. The New Experience is more slow to recognize that the authority of the Bible is of the same description as that of the Church, but it is gradually and half-unconsciously coming to this faith. A text of Scripture is no longer conclusive as to doctrine; a precept of Scripture is no longer conclusive as a command. The Bible is less and less looked upon as itself the word of God—a title never in the Bible applied to the Bible; it is looked upon as able to evoke the word of God in the soul of man. The authority is not in the word of Moses or David or Isaiah or Paul; it is in the Voice which spake to Moses and David and Isaiah and Paul. The Bible still speaks with authority; but its authority is not textual, but vital. If religion is "the life of God in the soul of man," then the Bible is the record of that life in the souls of men, preserved and imparted that the same life may be enkindled in others. It is not a substitute for that life; it is an introduction to that life. For those who have not the life in themselves there is a sensible loss of power in the Bible; for those who have that life in themselves there is a sensible gain. A book which brings us to God is better than a book which merely tells us about God.

This experience, which recognizes God as in his world of nature and of men, recognizes him in history working out a kingdom of God on the earth. Its hopes and aspirations are less celestial, more earthly. It is not so fond of singing

"O Paradise, O Paradise, who doth not crave
for rest?"

as it is of singing

"O Master, let me walk with Thee
In lowly paths of service free."

The battlements of heaven have grown dim, its angel choirs distant if not wholly inaudible; but the kingdom of justice, liberty, and uprightness on earth has become a more vivid hope. In the Christmas song the New Experience is inclined to lay too little emphasis on "Glory to God in the Highest;" it lays more upon "Peace on earth, good will toward men." Professor Stowe used to tell of a negro preacher in Florida who said that he did not understand the Sermon on the Mount very well, but he understood the Book of Revolutions perfectly. The New Experience cares less about the Book of Revelation than about

the Sermon on the Mount. Discussions about heaven and hell, purgatory and second probation, interest it less than discussions about child labor, tenement-house life, civic corruption, divorce and the causes which lead to it. It regards life less as a preparation for a celestial kingdom of God; it works more for a terrestrial kingdom of God as the true consummation of earthly life. It pays less attention to individual salvation than the fathers did; it pays a great deal more to social redemption. It loses something in regard for the spiritual life of the individual; it gains much in regard for the moral renovation of the community.

With this faith in a present God—in nature, history, the ancient prophets, the individual soul, human society, is faith in a Christ who is the "human life of God." Mark tells us of an occasion when Jesus went before his disciples and they followed after him afraid and amazed; John tells us of a time when they sat in intimate communion with him about the supper table, and John himself reclined with his head on the Master's bosom. Sometimes the Church has followed the Divine Christ, their prevalent feeling one of awe; the New Experience sits with the Human Christ in intimate communion, its prevalent feeling one of fellowship. These changes in mood are perhaps necessary, certainly they are natural. Yet it would not be just to say that the reverence of the second mood is less real, or the loyalty less absolute. Perhaps neither mood can fully understand the other. Certainly the more familiar approach to the Son of the Carpenter is leading many to know and to honor him whose acquaintance we may well hope will grow to love, whose honor to worship.

In life the contrasts here intimated are not clearly defined. Antitheses are always sharper in literary expression than in actual experience. Nor is what we call the New Experience really new; expressions of it may be found in the religious biography of all periods. It is new only as a general tendency. So the New Theology is not really new; as Professor A. V. G. Allen has shown, it is a revival of Græco-Christian philosophy. What is new is the increasing acceptance of it. Nor have we here attempted anything like a comprehensive and complete account of the New Experience. We have only indicated certain of its more obvious elements. Nor do we undertake to determine accurately the relation of gain and loss in the change from the one mood to the other. Doubtless there is some loss, doubtless some gain. We only seek to point out the fact that the change is one in religious experience as well as in theology, and that it is not all loss. No one need conclude either for himself or for the race that religious life is dying out because not merely the philosophy about the life, but the manifestations and expressions of the life, are undergoing subtle and half-perceived but real and even radical changes.

❁

In Defense of the Poor

"They ought to leave tenement-house reform alone," said a young workingman the other day, "but they won't. What difference does it make what the tenants think about it? There's too much money behind the attack on good tenement-houses. A woman in the house where my mother lives complained to a builder's agent about a break in the drain-pipe, and he swore at her and told her, 'The Health Department and the Tenement-House Department can't touch us.' That's the way of it: they have the money. The poor people have no show."

How helpless these tenement-house dwellers feel, not only in making efforts for cleanliness and health, but also in effort for moral decency, when their interests clash with those of the owners, is illustrated by the statement of a charity worker, quoted in the Report of the Tenement-House Commission of New York, that she had heard women bemoaning the birth of a daughter for fear of the dangers to her chastity that would threaten her under the conditions that prevailed in the tenements where they lived.

It is true that only a minority of tenement-house dwellers recognize in this manner how greatly their health and lives and character depend upon the form of house in which they live. It is true that thousands of tenement-house dwellers naturally surround themselves with dirt and disease and vice. One needs only

to stroll through some of the newer tenements to see the bathtub used as a receptacle for rubbish. This is only saying in concrete form that it is impossible to make people cleanly, healthy, and virtuous by law.

But this, at least, it is possible to accomplish by law: to abolish and prevent conditions which compel people to live in surroundings of dirt, disease, and vice.

Such surroundings are forced upon thousands of families who live in ill-constructed tenement-houses. To select out of a large number only three features of such buildings—the inadequate air-shafts and courts, the dark rooms and hallways, and the outrageously misnamed sanitary accommodations—what more efficient means could be devised for creating wretched surroundings from which the undefended poor find it impossible to escape?

In the first place, these surroundings produce and accumulate filth. The air-shaft, so called, is often no more than a sort of chimney from which windows in inner rooms open. It is frequently closed at the top with a skylight, or, worse, mere slats, shutting out light and air. It is an inviting place for the disposal of garbage and waste; it gathers and retains the foul air of all the flats; it rarely can be and even more rarely is cleaned. The dark hallways not only make even the worst filth inconspicuous, but, by exclusion of pure air, which is the most effectual disinfectant, render it most noxious. The inner rooms, also, which have no opening to the outer air, of which there are over 200,000 in Manhattan alone, hide the dirt and vitiate the air. The vaults that open directly into the sewers, and are usually situated in the crowded courts or yards, but sometimes even in the damp, unwholesome cellars, create a condition of filth that cannot here be described. When it is remembered that such filth must be daily endured by women and children, that it is to be found often in close proximity to the family washing, and that often it is spread, by an almost inevitable process, from the courtyard to the roof itself, it can be understood why a Tenement-House Inspector the other day remarked, as he started on his tour, "Well, I must go now and see a smell." What must it mean, not to inspect that sort of thing periodically, but to live in its presence continuously? And it is the women and children, not the men who are off at work, who have to live so.

In the second place, these wretched features of old tenements propagate disease. Uncleanliness is the great medium for disease. Those air-shafts have well been termed "culture-tubes," by a metaphor referring to the tubes in which pathologists cultivate disease germs. The dark hallways and rooms and the pestilential vaults bear their share in undermining the health and wasting away the lives of the poor. Tuberculosis, which thrives best on bodies thus environed by filth, is an epidemic in New York. This is the expression that is used by medical authority. Every unventilated air-shaft, room, hall, and vault in these tenements is a nest for the bacilli of this insidious disease.

In the third place, these wretched features of tenement buildings promote the worst moral and social evils. The narrow air-shaft, with windows opening opposite one another, denies to the dwellers that privacy which is the great defense of personal virtue. The dark public hallways afford lurking-places for many kinds of corruption. And the communal vaults are in some respects the worst of all. What protection have the poor here?

A year ago in New York State there was passed a law which abolished these features from all new tenements, and required their amelioration in all tenements then constructed. The enactment was jubilantly welcomed by lovers of humanity. The Outlook then took occasion to say that the fight for decency was by no means ended. For as long as there are men who for the sake of dividends will risk the lives of passengers on land and sea, will endanger health by adulteration of drugs and food, and will make big profits from fuel when people are suffering from cold and exposure, there will be men who will endeavor to increase the herding together of humanity because it is "commercially profitable." It ought to surprise no one, therefore, that some builders in Brooklyn and the Bronx who wish to build new houses at less expense than the provisions of the present law require, and that some builders in Manhattan who do not wish to incur the expense involved in

such mild requirements as putting glass panels in doors, cutting larger windows in dark rooms, and substituting for scandalously filthy vaults measurably adequate sanitary accommodations, should combine to undo a large part of the work not only of last year but of a generation past. The offense is the worse because the present law has been proved practicable. Tenement-building was never so active in Manhattan as it is to-day. The old tenements that have already been improved in accordance with the law have commanded immediate profitable sale and have been easily rented. And the smaller tenements, such as are typical in Brooklyn, are not only being found acceptable in that borough, but have been successfully tested by very similar conditions in Buffalo, where for years they were erected under the provisions of a local ordinance.

The State Senator who introduced the most drastic of the repealing bills at Albany has shown the good sense to announce that he will be the sponsor of it no longer; though the bills themselves are not yet withdrawn. Governor Odell, whose recommendations in the message to the Legislature encouraged the greed of the builders, has already put himself on record as in sympathy with enlightened methods of tenement legislation and supervision. Such facts should nerve the arms of all who are fighting the battle of the tenement-dwellers against the men who would traffic in their health, life, and character. Especially should those who have comfortable homes and access to God's free air and light utter their emphatic nay against the proposal to deprive others of the air and light that are theirs by the same token. This does not concern New York City alone, or New York State alone; it concerns all in city and country throughout the broad territory of this Republic who care enough for democratic institutions to insist by word and deed that, in spite of the power of wealth, it shall not be true that the poor people, those poor in intelligence or education as well as those poor in material possessions, "have no show."

The Impressions of a Careless Traveler

VIII.

April 18.

HISTORICAL associations, extraordinary beauty of natural scenery, and exciting adventure have combined to make the last three days spent in the Crimea and its vicinity the climax in interest of our trip thus far. Events have followed each other so rapidly that this is my first opportunity, now that we are back on the Prinzessin again, to make any record in my diary.

My impressions of the Crimean War are derived partly from vague recollections, partly from the reports of a fellow-passenger who was in the Crimea as a boy and saw the charge of the Light Brigade; he had with him on the Prinzessin General Wolseley's "History of the Crimean War," which he was studying as a preparation to his visit. Accordingly he was the ship's expert on the subject. What I record here is a combination of my recollections and his own information as he gave it to us in fragmentary conversation in the smoking-room and in more continuous form in an informal lecture in the Social Hall one evening.

Once upon a time, say 185–, Russia, on some excuse, I know not what, opened an attack on Turkey, her unconcealed object being to obtain possession of Constantinople, and with it the passage to the Mediterranean. She offered undisputed possession of Egypt to England if England would acquiesce in her purpose. Perhaps England thought she could get undisputed possession of Egypt without Russia's help, as she has since done. At all events, she did not acquiesce; on the contrary, with France, she came to Turkey's aid. The Crimea is a Russian peninsula, running out into the Black Sea, with two natural ports—one Balaclava, a Lilliputian harbor, the other Sevastopol—pronounced in Russian with the accent on the third syllable, Sevastópol—a harbor of considerable size, well protected by nature. The Crimea was Russia's point of departure and base of supplies. If this could be taken from Russia, her proposed attack on

Constantinople would be rendered impossible. The Crimean War was a war waged by France, England, and Turkey to get military control of the Crimea, and especially Sevastopol, and so prevent Russia from advancing on Constantinople. The English took possession of the tiny land-locked harbor of Balaclava on one side of the peninsula, perhaps ten miles from Sevastopol by road and twenty by sea, without opposition. The harbor is quite inadequate for vessels of any considerable size; indeed, what England could do with it except use it as a landing-place for provisions, I do not know. She made no attempt to fortify it, and, so far as I can see, Russia has made no attempt to fortify it even now. She landed her troops, also without opposition, on the Sevastopol side of the peninsula about thirty miles from Sevastopol, and advanced upon the city. At the crossing of the river Alma, about twenty miles from Sevastopol, the battle of Alma took place; the Russians were defeated, and the allies advanced upon Sevastopol. It was ill defended and might easily have been taken by assault, but caution was deemed the better part of valor, and the allies made a circle about Sevastopol and connected their forces with the harbor at Balaclava, in and near which their fleet, such as it was, was lying. Here the Russians attacked; here took place the famous Charge of the Light Brigade; here again the Russians were defeated; and again the allies advanced. Midway between Balaclava and Sevastopol took place the third battle, that of Inkerman; again the Russians were defeated, and the road lay open to Sevastopol. But the Russians had used well their time in preparing fortifications, and these made a siege necessary. After a protracted siege an assault was ordered, the English storming one fortification known as the Redan, the French another known as the Malakoff. The defeat of the Russians in the fourth battle necessitated the surrender of Sevastopol and the abandonment of the attempt on Constantinople by Russia, and so ended the Crimean War. England and France should have occupied the Crimea and so prevented Russia's future realization of her purpose. But France was tired of the war, England could not or would not carry it on alone, and so it ended, leaving Russia checked but not checkmated in her march to the Mediterranean, and practically free to disregard her promises to make certain specified ports in the Black Sea free, and I believe also to leave Sevastopol unfortified.

Our Crimean shore experiences, as promised, were to include three days: (1) a visit to the fortifications of Sevastopol and to the harbor of Balaclava; (2) a drive across the peninsula and along its northeastern shore to Yalta; (3) a visit to the summer gardens and summer palace of the Czar near Yalta. We were off the boat and on the dock by nine o'clock on Wednesday morning, April 16. The square was full of carriages, and the passengers were rushing to and fro to get in. We took the one into which we were put by Cook, and thereby learned a lesson. The next morning the Student picked out our carriage horses and driver, and we got far better accommodations. Through some lack of direction or failure by the coachman to understand them, the installment of carriages, eight in number, to which we belonged did not drive to the fortifications, but direct to the village and harbor of Balaclava. Cook's agent endeavored to rectify the blunder by proposing that we take the fortifications on our return, and even went with us to insure success; but the sun was getting down, the air was getting cold, and we were getting weary, so we gave them up, getting a *quasi* bird's-eye view from the distance. I think it was no loss to the ladies and no great loss to me, although I had anticipated seeing with interest the fortifications of a siege and an assault in one of the great wars of contemporaneous history, in which at the time I took no little interest. It was, in a small way, like being within a few miles of the battlefield of Gettysburg and failing to see it. But it really did not matter; for the whole topography I could see and understand from a distance.

After a drive of about two hours across an undulating country, we approached over a gentle eminence what appeared like a fresh-water pond—it might, at a guess, be a mile or a little less long, and a quarter or possibly half a mile wide—but I am not good at estimating distances, and I made no attempt to estimate the size then. The shore of this pond was lined by what looked like the

edifices of a summer resort, and it was not until we had fairly drawn up at the door of the inn where we were to lunch, that we assured ourselves that this was Balaclava. The entrance to this land-locked pond was so narrow and winding, and the hills which walled it on either side were so high, that we could discern no exit from it, nor easily convince ourselves that it was really a harbor. I do not think that even a moderately large steamer could have gotten in; I am sure it could not have turned round in the harbor unless it had twin screws. Indeed, while we were there an American steam yacht, the Wanderer, entered the harbor. She was not a large boat, and she had to use her twin screw to get round the sharp corner in entering the harbor. This harbor was the scene of one of the tragedies of the Crimean War. Some transports lay inside. Fearing lest the Russians should get command of the neighboring heights and shell them, the boats were ordered into the open sea outside, and, a storm coming up, one of the transports was driven on shore and several hundred soldiers perished.

In one respect we were fortunate in not having gone to the fortifications of Sevastopol. We had a choice of seats at lunch, and so had not to take our meal, as some did, in an unprotected position outside, where we should certainly have been uncomfortable in the wind and dust. A walk up on to the hill above the town for some of us, a row in the harbor for others, a drive home, taking in a Greek monastery most romantically situated on a shelf of rock overhanging the sea, and including an ancient chapel in a cave which nature and art had combined to fashion in the cliff, where a devout old soul was droning out a prayer or a Scripture lesson in the sing-song tone which for some inexplicable reason is supposed to be the especial vehicle of piety, finished the first day.

Thursday involved a trifle of a drive—fifty-three miles—from Sevastopol to Yalta, in carriages each with three horses harnessed abreast. We started from the dock at about half-past eight, some hundred and fifty passengers in a long procession, or succession of processions, for each boat-load of passengers started as soon as they had found their places in the waiting carriages. We drove out of the city, over a well-macadamized road through a rolling country, but approaching a range of hills of considerable elevation. We passed a monument which marked the Battle of Balaclava, guessed as well as we could just where was the charge of the Light Brigade, then descended a long slope, watered our horses, and ascended a long hill, descending it on the other side into a fertile valley only to enter on another long climb, and so down another long descent and into another fertile valley, in the heart of which was a curious Tartar village of one-storied houses, made, I judged, of sun-dried brick, with roofs some of thatch, others of tile. Once we passed what, judging from the children gathered about it, was a school, where, with some dirty and unkempt urchins, were some others well dressed, for whom a coachman was evidently waiting—a, to us, unexpectedly democratic incident in so aristocratic a country. Once we passed the forlornest-looking graveyard I ever saw, so covered with stones that not a blade of grass could grow, and with graves marked by ill-set boards for monuments or not marked at all. At one point some ragged boys ran by the side of our carriages calling for bakhsheesh in the most cheerful tones of voice and with laughing faces, as though beggary were a great joke. As we left this Tartar village we began to climb a third hill, longer and steeper than any which had preceded. The road, though not very wide, was very skillfully engineered and as smooth as a floor; but it was the only sign of twentieth-century civilization which we saw. At length, after we had driven for four hours, now ascending, now descending, now looking off for miles from the vantage-ground of some eminence, now dipping into a cultivated valley or shut in by impenetrable woods on either side, but with the general trend of our road upward and every descent less than the ascent which had preceded, we found ourselves approaching simultaneously our luncheon hour and what I suspected, from the character of the rocks and the scanty vegetation, was what the farmers in New England call "the height o' land." At a turn of the road we found the carriages of our predecessors emptied of their passengers and without their horses. Our driver made signs to us to

get out. This, then, is the "Gate of Baidar," where our itinerary has told us we are to lunch. Miss —— and I hurry forward to secure places for the party, while the Student and the Matron follow more slowly. Another house, another stable, more carriages, fellow-passengers in groups upon the road and on the rocks, a great archway of stone spanning the roadway, so large that its top constitutes a platform big enough to hold tables for over a hundred to sit down at lunch together, a score or so of our fellow-passengers already seated there or getting their seats, through the archway and—

It is impossible to record what I saw. It was so like an impossible vision which might disappear in a moment that I forgot my purpose to secure seats for our party, and turned back to hurry the Student and the Matron forward, lest the picture should vanish before they arrived. We were on the top of a cliff eighteen hundred or two thousand feet high; above us rose peaks three or four hundred feet higher; below us, at our feet, lay the Black Sea; upon its waters our steamer could be discerned, looking like a launch for size; half-way down the cliff, on a promontory of rock jutting out over the sea, a Greek church; zigzagging down the cliff to this platform, and from it thence along the base of the cliff and about midway between its precipitous wall and the edge of the sea, the road we were to traverse. That picnic lunch will, I think, never be forgotten: on the top of the great stone archway, the peaks above us, the wall of rock extending for miles before us, the sea below us, glimpses here and there of the road which presently we were to follow for twenty-five miles further to our resting-place. The lunch itself, which had been provided by Cook and sent out to this mountain solitude in advance for our coming, amazed us all by the variety of the viands and their appetizing and even luxurious character, where very simple food and plain service might have been expected. Fish with much-spiced dressing, fish in jelly, cold meats pressed and jellied, cold chicken, vegetables prepared in ways new to me, cakes, and fruit, with bread, butter, and cheese, were given in an abundance which matched even the German appetites. Tea, mineral water, wine, and beer were there also to be bought at fair prices, and the supply seemed inexhaustible.

But the drive that followed! Twenty-five miles of Gibraltar—no! of one Gibraltar piled upon another, with a road clinging to the side of the cliff midway between the summit and the sea; and yet this, too, is inexact. Let me try to recall it more accurately—as if that were possible. Perpendicular palisades, from one to two thousand feet in height; piled at their base a mass of rock composed apparently of débris fallen from the cliffs and extending another thousand feet or so down to the sea; the sea, vast, illimitable, suggestive of boundless space, the only horizon the line where sky and sea meet and melt into each other, indistinguishable, inseparable; then between this sea and these palisades a shore line, sometimes scarcely less perpendicular than the cliffs above, sometimes sloping gently to the sea at its base, sometimes so narrow that our road seemed to hang over the sea, with no spot below large enough for a tree to find root or a blade of grass to grow, sometimes so broad as to afford a resting-place for terraced gardens and vineyards, or a bit of pasture, or even an occasional village; sometimes naked, grim, desolate, terrible, sometimes fruitful, efflorescent, fragrant; through this scene of desolation and of fertility, of mountain precipice and blue sea, of alternately exquisite beauty and awful grandeur, a road constructed at the foot of the cliff, but far above the edge of the sea, winding in and out in endless curves and up and down in endless undulations to meet, evade, or overcome the difficulties of the way; at intervals the most primitive of villages, with swarthy Tartars looking curiously at us as we passed, sometimes with contemptuous amusement depicted on their faces, sometimes with jeering greetings as we drive by; in many cases the perpendicular face of a precipitous rock constituting the sole back of their houses, which seem as though they were plastered on the rock like the nests of some gigantic and ingenious bird—such were the features, or some of the features, of the most romantic drive I have ever taken or ever conceived of. It is nearly or quite seven o'clock when we at last turn around the edge of a promontory we have been long approaching and see

far down, a thousand feet below us, the lights of a considerable town glittering along the shore and the lights of our steamer in the open sea near by—for there is no harbor; and our driver points with his whip and says, "Yalta," and our tired horses, taking new courage from an instinctive sense that their work is nearly done, begin the long descent on a run which would terrify us had not our hearts lost the capacity for further sensation. The wind has risen as the sun has gone down; it is growing cold and dark, and we are growing hungry, and the prospect of being on board our yacht and sitting down to her well-equipped dinner cheers our hearts. We do not care how soon we are there. Now we are driving by a long wall, over which we get glimpses of fruit trees in blossom, and occasionally of garden beds and walks; now by a great gateway, with gorgeously gilded double-eagles perched on standards, and again our communicative driver points his whip and says, "Livadia"—the summer garden of the King, which we are to visit to-morrow. Now we are trotting in a long procession along the quay, where the waves from the sea are breaking with such force as now and again to send the spray over us—interesting embarking this is going to be, but no matter, we have good officers, all will be safe, and a romantic embarkation will form a fitting culmination to a romantic day. Halt! The carriages fill the street from curb to curb. Others come rolling up behind us. What is this? The hotel? But why do we stop at the hotel? Why do we not drive on to the landing-place? No one who knows can speak English. No one who can speak English can find out. Presently it begins to be rumored that we cannot embark to-night; there is no harbor, and the sea is too high. What shall we do? We will wait a few minutes to see if the rumor be true and to get directions from the men who have charge of the excursion. Presently the rumor is verified, but simultaneously it is made to appear that no one regards himself in charge of the excursion. There is with us an agent of the steamship, but it is not his business to take care of us on shore. There are two of Cook's agents here, but they do not think it their business to take care of us after the drive is over. It dawns on me that it is a clear case of everybody for himself. The Student and I start to look up accommodations. Hotel number one is already taken. Hotel number two is equally full before we reach it. Hotel number three proves to be a lodging-house only, which furnishes rooms, but not meals—a not uncommon type, I believe, in Russia. All the hotel clerks are running about distracted; all the passengers are running about distracted after them. The passengers cannot understand the clerks, nor the clerks the passengers. To show that I want a bed I put my head on my hand and shut my eyes; to show that I want two beds I hold up two fingers. Two roubles? ($1.08). I nod my head; but also two rooms—and I put my head on my hand twice. Then two fingers are held up twice and something added. I distinguish roubles and something else unintelligible. I nod. I will pay three roubles if necessary, and two roubles and something will be less than three roubles. With some difficulty we make this clear and are taken up to see the rooms. They seem clean but barren, one bed in each, with a mattress but no bedding. We make it clear that we want another bed in each, take the keys that no one else may get them, and go after the Matron, content to have assurance that she will not have to sit up in a chair or sleep on the floor. Except for one provident couple, there was not, I think, so much as a toothbrush in the entire company. A few persons more energetic than the rest shopped for toilet conveniences and night-garments, but most of us settled down to what we had; for the ladies, hair-pins and side combs answering for their "coiffure," and chewed match-ends for toothbrushes. As to *robes de nuit*, they were not to be thought of.

How the Student, Miss ——, and I went out to get some supper for ourselves and some provisions for the Matron, who needed rest even more than supper; how at the primitive restaurant we had to divide rations for one among two or three, and go ourselves to the room adjoining the kitchen for bread and butter; how the Matron stayed at the lodging-house, and by signs made the porter understand that she wanted a fire in the great Russian stove, and got it at last, after much waiting, but could get heat from the big

stove only by sitting immediately in front of the open door to the sort of oven in which the wood was burning; how gradually the furnishing for the night was brought in—parts of an iron bedstead at intervals, then, in succession, with waits between, a mattress, bedclothes in installments, water for washing, bottled water for drinking, and, last of all, some towels; how all we could bring her home for her frugal supper was some bread and butter, a little fruit, and some Russian chocolates; how we slept on hard beds, and whenever we wakened heard the noise of the waves dashing up against the sea-wall outside; and how when my bill came in I found I had to pay for light, attendance, bedding, and making up the bed, so that my rooms were four roubles each instead of two, I need not recall here more in detail. This was not an imposition, as I was at first inclined to suppose. We had landed in a house characteristic of Russia and of Oriental countries, in which the landlord furnishes the room and the bedstead, and leaves the traveler to furnish his own bedclothes, which he ordinarily brings with him.

The next morning the problem how we were to get on board our steamer presented itself. The wind, rattling the shutters and blowing open the French windows of our room, gave us no hope of a quiet sea, and I was not surprised to see the yacht moving up and down—in more ways than one—a half-mile or more from the shore. I succeeded by signs in getting from the landlord of the lodging-house a glass of tea and some bread and butter for the ladies, and then started out to reconnoiter. At seven o'clock I was at the chief hotel, but no one knew what was to be done, and every new passenger I met had a new rumor to repeat or a new plan to propose. We must ride back to Sevastopol; the horses were exhausted and the drivers would not take us; we must wait here until the sea goes down; we are going to be taken to the steamer in launches, etc., etc. At length it began to be reported, though still no official notice was given, that there was a Russian local steamer inside the breakwater, that we were all to go on board of her, that she was to take us back to Sevastopol, and that we were to embark on the Prinzessin in the harbor there. This arrangement was in fact made, I believe, by the captain of our steamer through the intermediary of the first officer. We had nothing to pay on the steamer, except for luncheon if we chose to take it. So far as I know, not till all the arrangements were consummated and most of the passengers had gotten word and were on board, or preparing to go on board, did the agents of the Cook Company appear again. Whether they kept out of sight because they did not know what to do, or because they wanted to avoid for Cook all responsibility for the predicament in which we were placed, I do not know.

Generalizations from a single experience or a brief series of experiences are not very safe; but the results of our experiences on this trip confirmed Mr. ——'s advice to me; before I left New York he said: "Buy your circular tickets of Cook; occasionally you can use him to advantage in especial carriage trips—but avoid the 'personally conducted tour.'" In fact, we paid a good price at Sevastopol in order to have all care taken off, and when the crisis came it all tumbled back on us again; we paid for a third day's excursion—to the garden of the Czar—which we never had, and had not only to pay our bills at Yalta, to which I do not especially object, but had to shift for ourselves under circumstances of no little perplexity, while our personal conductors disappeared from the scene, not to appear again until all the trouble and perplexity were passed.

To our surprise, the Russian steamer, though primarily for freight, had very comfortable provision for passengers, and we, with unexpected steadiness, steamed back over the water which we had looked down upon the day before, our "yacht" accompanying us all the way. Although we lost our promised view of the palaces and the splendors they contain, we gained a new view of the marvelous cliffs along which we had driven. We are now at home again on the Prinzessin. Our time on the yacht is growing short, and we begin to wonder whether after the exchange to land traveling we shall be as comfortable. But there is a pleasant thought in the idea of longer time in our stopping-places and larger space for manipulating our luggage to compensate for the luxuries we shall leave. L. A.

HOLDING UP A STATE

THE TRUE STORY OF ADDICKS AND DELAWARE[1]

BY GEORGE KENNAN

II.

THE best and most trustworthy evidence that I have been able to get, from various sources and from representatives of all parties in Delaware, seems to show, beyond all reasonable doubt, that political corruption in that State did not originate with Mr. Addicks. As long ago as 1850 it was the custom of both parties to give voters—or at least a certain class of voters—something in the nature of payment for their votes. Such payments were not definitely agreed upon in advance, nor, as a rule, were they made in money. They consisted, generally, of some commodity, or article of merchandise, such as a barrel of flour or a pair of boots, which, after the election, was given to the voter as a sort of present or reward for having supported the party at the polls. This, of course, was a demoralizing practice, and it gradually familiarized a certain class of the people with the idea that loyalty to party was a thing that entitled the loyal partisan to a reward; and that votes, consequently, had a certain market value dependent upon the exigency of the political situation. From rewarding the faithful partisan *after* the election to buying up the uncertain voter *before* the election was only a step, and that step was soon taken. Even before the Civil War both political parties were buying votes, when it seemed expedient to do so in closely contested elections, and each party attempted to excuse itself by alleging that the other began the practice, and that the resort to fire, as a means of fighting fire, was a justifiable exercise of the right of self-protection. The buying of votes at that time, however, was on a comparatively small scale, and the voters purchased were generally poor men, of weak or dubious character, to whom money was of more practical importance than principle.

After the Civil War, when the negroes were enfranchised, the Democrats found themselves confronted by a new and threatening situation, due to the acquirement of political rights by a class that had before been ignored. The colored population in the two lower counties already had considerable numerical strength, and there was no doubt that it would vote solidly for the party that had given it the ballot. Fearing this accession to the Republican ranks, and believing that the negroes were unfit, in point of character, education, and training, to exercise the right of franchise, the Democrats tried in various ways to eliminate them from the political situation; and, as a means to that end, they finally enacted what was known as the "Delinquent Tax Law." This law provided, in substance, that every man who failed to pay his taxes within a certain specified time should lose the right to vote, and should not again be qualified as a voter until his arrears of taxes had been fully paid. Although this law, ostensibly, was not aimed particularly at the negro, and made no color-line distinction, its practical effect was to disfranchise a considerable part of the colored population. The negroes constituted the poorest and most improvident class; they were sometimes unable to pay their taxes; and many of them were so shiftless, careless, or indifferent that they neglected to pay them within the specified time, even when able to do so. It is charged, furthermore, by the Republicans, that the Democrats, who had control of the levy courts and all the taxing machinery, carried their own delinquents on the roll of voters while excluding all others; and that by spiriting away the tax-collectors they often made it impossible for

[1] See editorial comment elsewhere in this issue.

Republicans to pay their taxes, even when the latter were ready and anxious to do so. It was not an unusual thing, just before an election, to see large numbers of Republican voters hunting vainly for a Democratic tax-collector who had mysteriously disappeared; and it is said that, in one case, a party of determined Republicans, who wished to pay their taxes so that they might have the privilege of voting, chased a fugitive tax-collector all the way to Philadelphia, and there dragged him out of bed, where he had sought refuge with all his clothes on, and insisted that he should take their money and give them receipts.

Coincident with this abuse of the delinquent tax law, there was more or less buying of votes by the Democrats—and probably by their opponents—in all parts of the State; and the poorer adherents of both parties were getting more and more into the habit of "charging something" for their votes.[1]

The "corruption fund," at that time, was not large in either party; but it seems to have been included regularly in the campaign budget, and party nominees of all grades were expected to contribute to it. "Twenty years ago," said a prominent Democratic leader to me, "I went to Thomas F. Bayard and asked him for a contribution to this fund. It was wrong, of course; but we did that sort of thing in those days. He said to me, 'Mr. X——, I'll give you money for any legitimate campaign expense—for hall rent, for speakers, for printing, for flags, or for bands of music; but I won't give you a cent for the purchase of votes. This practice of buying votes is corrupting and demoralizing the people, and preparing the way for some rich man to step in and buy up the State.'"

The words of Senator Bayard were prophetic, and the shadow of the "rich man" who would attempt to "buy up the State" was already falling across the northern boundary line of Newcastle County.

In 1877 John Edward Addicks, who was then a young married man and a well-to-do flour merchant of Philadelphia, became financially embarrassed, and found it necessary to reduce his expenditures and live, for a time, as economically as possible. He determined, therefore, to go out of the city and seek a residence in some small suburban village, where his housekeeping expenses would not be so great. He happened to have, in Philadelphia, a friend named Joseph Barnard Wilson, who lived in the Delaware village of Claymont, just across the Pennsylvania line, in the county of Newcastle. The wives of the two men were close friends, and it was probably through the influence of the Wilsons that Mr. Addicks bought, in Claymont, a country place of about eight acres known as "Riverview" (afterward called "Miraflores"), and, in 1877, went there with his wife and his daughter to live. In this manner he acquired a residence in the State of Delaware. He continued to do business in Philadelphia; but his home was in Claymont, and he went back and forth, night and morning, by train. In the Claymont house the Addicks family lived for a period of about eight years, maintaining close friendly relations all the time with their neighbors the Wilsons.

In 1885 Mr. Addicks, who in the meantime had acquired wealth as a speculator, promoter, and organizer of gas companies, closed his "Riverview" house at Claymont and moved with his family to Boston, where his business interests then centered. He had at that time manifested no Senatorial aspirations, and it is quite possible that he might have sold the Claymont house and given up his residence in Delaware if he had not felt a strong friendly interest in the Wilsons, and if Mr. Wilson had not died early in the following year. When that event occurred, Mrs. Wilson was left in rather straitened circumstances, and Mr. Addicks helped her out of her financial difficulties by paying her two hundred dollars a month for board, and going there to stay, for a day or two, whenever business called him to Philadelphia.

At the time of Mrs. Addicks's marriage, in 1869, her father, Washington Butcher, of Philadelphia, gave to her, as a wedding present, the furnished house No. 2115 Spruce Street, where she lived with her husband for a period of two or three

[1] This expression I found still in use in Kent and Sussex Counties. A man who sells his vote is said to "charge for" it; while a man who goes to the polls unbought, or without promise of reward, "votes his sentiments." Speaking of a certain exceptional citizen in Dagsboro, a Sussex County man said to me, "He doesn't charge anything for his vote; he votes his sentiments."

years. In 1872 Mr. Addicks persuaded her to sell this house for $36,000 and let him have the money to put into his business, promising that in the near future he would give her other real estate of equal value. When they moved to Claymont, in 1877, he deeded to her the "Riverview" house, in partial fulfillment of this promise. On the 14th of April, 1888, however, about two years after the death of Mr. Wilson, Mr. Addicks induced his wife to deed the "Riverview" house in Claymont to Mrs. Wilson, in exchange for certain bonds left to the latter by her husband at his death. This deed will be found recorded in the office of the Recorder of Deeds for Newcastle County, Deed Record I., Vol. 14, p. 509. It thus appears that in January, 1889, when Mr. Addicks came into Delaware politics as a candidate for the Senatorship, he did not own the "Riverview" place, which was supposed to be his residence; did not live in the State, except when he came to Claymont and boarded for a day or two at Mrs. Wilson's; and was actually a citizen and resident of Boston. When he was asked one day in Claymont, by a lady from Pennsylvania who happened to be visiting Mrs. Wilson, how he could run for the Senatorship in Delaware when he actually resided in Massachusetts, he replied, "Oh, I live here; I've got a bureauful of clothes upstairs."

In the fall of 1888, about six months after the transfer of the Claymont house to Mrs. Wilson, Mr. Addicks went to Europe, leaving his wife and daughter in Boston. Upon his return. in January, 1889, he called up Mrs. Addicks by long-distance telephone from the pier in New York, exchanged greetings with her, and said that he could not come to Boston at that time, for the reason that important business required his presence in Philadelphia. He thereupon went directly to Claymont, boarded for a few days at Mrs. Wilson's, then proceeded to Dover, where the State Legislature was in session, and there, upon the basis of "a bureauful of clothes" in the house of Mrs. Wilson at Claymont, he announced himself as a candidate from Delaware for the United States Senate.

When he made his appearance in the Hotel Richardson at Dover, he wore a silk hat and a fur-lined overcoat; he was accompanied by two or three showily dressed men whom nobody knew, and the party, as a whole, created in the quiet little capital something like a sensation. At first no one took Mr. Addicks or his pretensions seriously, and no one, apparently, discerned in him the skill, ability, and tenacity of purpose that he afterward manifested. He was regarded, by the people generally, with amusement and curiosity, as a new, exotic, and unfamiliar type of politician; but it was not thought for a moment that he could be dangerous or even formidable; and if it had been suggested, as a possibility, that he might eventually dominate the Republican party and hold up the State, the legislators who were voting for United States Senator that year would doubtless have laughed at the idea.

Mr. Addicks, however, had full confidence in his own methods and resources; and, without paying any attention to the attitude taken toward him by the people, he went promptly to work. The first thing he did was to secure what has since been called an "inventory" of the Legislature. Picking out a bright young law student, who had taken rather an active part in State politics, he said to him: "I have a matter that I want to put through the Legislature at this session, and I should like to get some information with regard to the character, circumstances, and antecedents of the legislators who will pass upon it. I am willing to pay liberally for this information, and I have sent for you in order to ask whether you can get it for me."

The young law student had never heard of Mr. Addicks, and knew nothing whatever of his character or purposes, but he was quite willing to do any honest work for liberal pay, and he therefore replied that he thought he could. Mr. Addicks then gave him a series of questions which he desired to have answered with reference to every Senator and Representative in the House of Assembly of that year. These questions were, in substance, as follows: Who is he? Where is he from? What is his age? Is he married or single? If married, how many children has he? Does he own any real estate? If so, are there any mortgages on it? What is he thought to be worth? (in money) and What are his habits and general reputation?

The young law student spent two weeks

or more in getting the desired information, and when the answers to the questions were ready, he called upon his employer and submitted them. Mr. Addicks looked them over, said they were perfectly satisfactory, and asked the young man the amount of his bill for the service. The student replied that the work was of an unusual nature, and that he hardly knew what charge should be made for it. He had spent, however, about two weeks in getting and compiling the data, and if Mr. Addicks thought that seventy-five dollars was not an excessive charge, he himself would be quite satisfied with that amount. Mr. Addicks promptly drew and gave to the young man a check for two hundred and fifty dollars.

The nature of the above questions indicates with sufficient clearness the use that Mr. Addicks intended to make of the information. He wanted, in the first place, to get from that Legislature a charter for the Bay State Gas Company of Boston; and, in the second place, he had decided to begin at once his campaign for the United States Senatorship. In order to attain the objects he had in view, by the methods with which he was most familiar, he needed information that would guide him to the legislators who could be most easily and safely "approached." A poor legislator, with a large family and a mortgage on his farm, would be more accessible, and would yield more readily to influences of a certain kind, than would a wealthy Senator or Representative whose property was not encumbered and whose checks at the bank were always good. That Mr. Addicks, as a matter of fact, did use this information in this way, and for the purposes indicated, I shall try hereafter to show. It is said that he has had an "inventory" of this sort compiled for every Legislature since 1889.

His next step was to get legal counsel to advise and help him in the matter of the Bay State Gas charter. Selecting one of the most eminent lawyers in the State, he called at the latter's office, introduced himself as J. Edward Addicks, and said: "Mr. D——, I am interested in a number of matters in Delaware with regard to which I may need legal advice, and I have called upon you for the purpose of retaining you as my leading counsel in this State. I wish to say to you, at the outset, that the fees you'll get from me will amount to more than all the rest of your business put together."

Mr. D——, who had never before heard of Mr. Addicks, but who was unfavorably impressed by this method of "approach," drew himself up with dignity and said: "You may stop right there, Mr. Addicks. I don't want any proposition or talk from you about compensation until after you have explained what services you expect me to render. If, when I shall have learned the nature of your business, I think best to act as your counsel, it will be time enough to discuss the subject of compensation." Mr. Addicks thereupon explained that his particular business at that time was to get through the Legislature a charter for the Bay State Gas Company of Boston. The lawyer asked to see the draft of the charter, and Mr. Addicks produced it. Mr. D—— looked through it hastily and then said: "The thing doesn't impress me favorably at first sight, Mr. Addicks, and I should like to have time to examine it and think about it."

"How much time do you want?"

"Three or four days; I'm going to Wilmington next Wednesday, and I'll try to give you an answer before that time."

A careful perusal of the proposed charter convinced Mr. D—— that it was thoroughly bad in form and in purpose, and when Mr. Addicks called upon him again, a few days later, he said to the latter: "I don't want to have anything to do with this charter, Mr. Addicks, for the reason that it seems to me improper, inconsistent with the public welfare, and opposed to what I regard as sound public policy. I must therefore decline to advise you with regard to it, and must also decline to act as your counsel in this or in any other matter." Mr. Addicks shortly afterward endeavored to secure the professional services of another eminent lawyer in Dover, who is well known both in and out of the State. This attempt also failed, and, so far as I have been able to ascertain, it was not until 1893 or 1894 that he succeeded in retaining as counsel a man in the first rank of the legal profession. Mr. Herbert H. Ward, the present Attorney-General of Delaware, acted for him in the divorce suit instituted by Mrs.

Addicks, on statutory grounds, in 1894, and has since been his counsel in the Bay State Gas cases.[1]

What first suggested to Mr. Addicks the idea of seeking election to the United States Senate from Delaware, and what his underlying motives were, I do not know; but the opportunity presented itself when, for the first time in many years, the Republicans, in 1888, carried the State and got a majority in the Legislature. He was much more likely to succeed as a Republican candidate than as a nominee of the Democratic party; for the reason that a large part of the numerically strong and purchasable colored vote in the two lower counties was Republican. The negroes could hardly be induced, by any temptation, to support a Democrat; but their choice as between one Republican and another might be influenced by money.

Mr. Addicks probably had little expectation of being elected to the Senate in 1889; but he thought it expedient to begin his campaign then, make a study of the field, get hold of men who might be useful to him, and await developments. He sent one of his workers from Boston down into the southern part of the State to announce his candidacy, enlist influential adherents, and notify all whom it might concern that he was prepared to put up any necessary amount of cash. In that session of the Legislature, however, he had no adherent, unless, as he said in the Creelman interview, it was through his influence that Senator O. D. Moore cast the decisive vote for Anthony Higgins. There is no trustworthy evidence, so far as I know, that he spent any money in that Legislature, or in that year. His first contribution to a campaign fund was made in 1890, when, it is alleged, he gave the sum of $5,000 to the Kent County Democratic Committee,[2] with the understanding that the Democrats, or some of them, should help him with his Bay State Gas charter.

The Legislature to be elected in 1890 would not have a United States Senatorship to dispose of, so there was no particular object in trying to obtain control of it; but in 1892 Mr. Addicks made one of his characteristically adroit attempts to get hold of the Republican nominees to the Legislature from Sussex County by giving them money for their campaign expenses. A well-known citizen of Wilmington, whom Mr. Addicks had already secured, went down into Sussex County that fall with a satchel containing ten thousand dollars or more in cash. One Senator and seven Representatives were to be elected to the House of Assembly from Sussex County that year; and to every one of these eight Republican nominees the agent of Mr. Addicks offered the sum of one thousand dollars for personal campaign expenses. A well-informed and experienced chairman of the Sussex County Republican Committee informed me that two thousand dollars was the largest sum that could be expended in that county for legitimate political purposes; and yet the agent of Mr. Addicks was offering to the Republican nominees eight thousand dollars, to be used at their own discretion, in addition to the regular campaign fund of the county, which was ample. His expectation apparently was that these men, finding it impossible to spend all of the eight thousand dollars, would use a part of it and put the rest in their pockets. If they should do this, he would get hold of them and be able to intimidate them; and even if they should not misappropriate the money, the mere acceptance of it would put them, to a certain extent, in his power. All but three of the candidates took the cash and used it—for legitimate purposes, I sincerely trust! Three of them consented to take it but refused to spend it, and eventually turned it into the general county fund. One of the three, whom I shall call Mr. L——, gave his thousand dollars to the chairman of the Republican County Committee, in the presence of witnesses, and took a receipt for it. Some months later, after the election, Mr. L—— chanced to meet Mr. Addicks, Mr. Layton, and Mr. Allee in the office of the Fourth Assistant Postmaster-General in Washington. As

[1] Mr. Addicks resisted his wife's attempt to get a divorce on statutory grounds, and she failed to obtain a decree. He subsequently allowed her, however, to get a divorce on the ground of desertion or non-support, and when he was free he married Mrs. Wilson.

[2] According to the statements of "three persons of integrity and character who have since made oath thereto," Mr. Addicks, in April, 1892, admitted that he gave this sum of $5,000 to the Democrats in order to help them elect their candidate for Governor (Robert J. Reynolds). The reason that he assigned was, "You know I had no interest in the Richardsons" (the Republican candidate for Governor and his father). This statement is abridged from the reply of the Republican State Committee of Delaware to a communication from J. Frank Allee, Chairman of the Union State Committee.

the Delaware trio left the room, Mr. Addicks turned to Mr. L—— and said, loudly enough for all to hear, "L——, you'd better send me your check for that thousand dollars of mine." This was to give Mr. Bristow and others who were present the impression that Mr. L—— had taken a thousand-dollar bribe from Mr. Addicks, and had then refused to "deliver the goods" or return the money.

How much Mr. Addicks spent in bribery and vote-buying in 1892 cannot with certainty be stated; but such information as I have been able to get, taken in connection with a semi-public statement made by him personally in 1894, indicates that the sum was not less than seventy-five thousand dollars. This amount, moreover, does not include twenty-five thousand dollars used in getting through the Legislature his Bay State Gas charter. In 1894 he told a prominent Republican politician of Sussex County, in whom he had confidence, that it had cost him twenty-five thousand dollars to get that charter, but that he had cleaned up two million dollars in the Boston gas "deal." Precisely in what way the twenty-five thousand dollars had been used he did not explain.

It is said by the Addicks men generally, and by Dr. Layton and Dr. Marshall in particular, that in the years 1892, '93, and '94, when none of the old Republican leaders would put up the money that was needed for campaign expenses, Mr. Addicks threw himself into the breach, assumed the leadership, paid the taxes of fifteen hundred Republican voters who had practically been disfranchised in Kent and Sussex Counties by the Democratic delinquent tax law, and, generally, reorganized the party in the State, provided it with funds, and set it on its feet. For this service he thought he was fairly entitled to the United States Senatorship. On the other hand, ex-United States Senator Anthony Higgins says that "Mr. Addicks was brought into our affairs shortly before the election of 1892, after our taxes had been fully paid and a thorough organization of the party in the State had been made. After the taxes had been paid and the party had been organized, he came to snatch for himself the result—hoping to succeed to Senator Gray's seat, then becoming vacant."[1]

[1] Evening News, Wilmington, Del., November 19, 1902.

Who is right in this contention I shall not undertake to determine, but it seems to me fairly probable that, inasmuch as Mr. Addicks did put up a large sum of money in 1892, some of that money was used to pay the taxes of Republican voters who had been disfranchised by the operation of the delinquent tax law, as well as to pay for the "work" and "influence" that were needed to give the party fighting efficiency. Be that, however, as it may, Mr. Addicks's expenditures in 1892 brought no practical results, for the reason that National influences and tendencies gave rise that year to a Democratic tidal wave, which rolled over Delaware and carried into the House of Assembly twenty-eight Democratic legislators out of a total membership of thirty.

In 1894, however, there were manifest signs of a reaction in favor of the Republican party, and Mr. Addicks, seeing that there was an excellent prospect of again getting a Republican majority in the Legislature, determined to use a very considerable part of the money cleaned up in the Boston gas "deal" in securing the election of legislators who would vote for him as United States Senator.

One of the first things that he attempted to do was to get, as chairmen of the Republican committees in Kent and Sussex Counties, influential and experienced men, who might be trusted to put his money where it would do the most good. Upon looking over his "inventory" for that year, he found the name of a man in the southern part of the State who had had some political experience and training, but who was poor, and who at that particular time was rather hard pressed for money with which to educate his three sons. Mr. Addicks promptly sent for this man, and said to him, in substance, "Mr. N——, I'm trying to find somebody who is willing and able to look after my interests in Sussex County, and I have sent for you in order to make a proposition to you. It is quite likely that I shall start a new party before long, and I shall want a chairman for my committee in your county. If you'll go in with me, I'll give you a salary of $100 a month, appoint you Chairman of the Sussex County Committee, and put $100,000 to your credit for campaign expenses."

Mr. N—— was very much taken by

surprise, and could only say that Mr. Addicks knew very little about him, and would hardly be justified in intrusting to a comparative stranger so large a sum as a hundred thousand dollars.

"That's all right!" replied Mr. Addicks; "I know what I'm about. I want somebody that will *stay* with me, and I'm told you're one of that kind."

Mr. N——, who had just borrowed five hundred dollars to pay the school expenses of his oldest son, was probably tempted by the offer; but he told the tempter, nevertheless, that he was not prepared, at that moment, to accept the proposition.

"Well," said Mr. Addicks, "if one hundred dollars isn't enough, I'll give you two hundred dollars a month and put a hundred thousand dollars to your credit."

Mr. N—— still held back, and replied that he could not act in such a matter without consideration.

"If you won't take two hundred dollars," persisted Mr. Addicks, "what will you take? Name your price."

Mr. N——finally declined to do anything more than consider the matter, and the interview closed.

In the spring of that same year (whether before or after the interview with Mr. N—— I do not know) Mr. Addicks is said to have come personally before the Sussex County Republican Committee, in the office of D. J. Layton, at Georgetown, with an offer to give them one hundred thousand dollars for campaign purposes, if they would nominate a ticket of legislators in that county who would vote for him as United States Senator. The gentlemen of the Committee, who were in favor of the re-election of Senator Higgins, declined to accept the proposition. Mr. Addicks, nevertheless, put thirty-three thousand dollars into the hands of the Committee that summer, thirty thousand dollars of which were spent in paying for "work," "influence," and votes. On the other hand, it is asserted by the Addicks men that the Democrats had a "corruption fund" of twenty-six thousand dollars that same year.

The State election in 1894 resulted in a sweeping Republican victory, the Republicans electing their Governor and Congressman, as well as nineteen out of the thirty members of the Legislature. Mr. Addicks regarded this victory as the result of his own efforts and expenditures, and had no doubt, apparently, that it would be followed by his election to the United States Senate. On the Thursday after the State election—that is, on the evening of November 8, 1894—a dinner was given at the house of Charles L. Moore, in Georgetown, Sussex County, to fourteen prominent Republicans from the southern part of the State. At that dinner Mr. Addicks made a speech in which, among other things, he said: "Well, boys, we've won! . . . I've bought it; I've paid for it; and I'm going to have it! It has cost me one hundred and forty thousand dollars!"

A Little Minister

By Florence Earle Coates

Far up the crag, 'twixt sea and sky,
Where winds tempestuous, blowing by,
  Leave giant boulders swept and bare;
  Where forkèd lightnings fitful flare,
And petrels sound their stormy cry—

A dainty bluebell, sweet and shy,
Lifted its head complacently,
  As guarded by the tenderest care,
    Far up the crag.

And I, whenever fear draws nigh,
In thought I stand 'twixt sea and sky,
  And, as of old in my despair,
  I bless the Power that set it there—
That tiny thing with courage high,
    Far up the crag!

A FIGHT FOR THE CITY

THE STORY OF A CAMPAIGN OF AMATEURS

BY ALFRED HODDER

Private Secretary to District Attorney Jerome

V.—The People's Cause

"OUR Grand Jury is debauched," Mr. Jerome affirmed, in the early days of the campaign. "I trust that no one in this audience will believe that I am saying this merely to make a startling statement. I am saying it in all calmness after years of observation of the Grand Jury system. Our whole Grand Jury system is debauched and rotten. Our Grand Juries are a mockery of justice.

"When I assert this, I know well that some of you will say, 'Oh, Jerome is a fanatic; he deals in overstatements.' But do any of you know how a Grand Jury is drawn? I do, for I have seen it often. A justice walks in, hat on head, cigar in mouth, and says to an attendant, 'The Grand Jury will now be drawn.' The clerk puts a number of slips with names on them into the disk, and spins it round. Then the slips are drawn, and a conversation of this sort takes place: 'John Harsen Rhoades, banker'—and the slip is put back. 'Patrick MacDougal, liquor-dealer'—'Ah, that's our man'—and MacDougal, the liquor-dealer, goes on the jury. That is a sample of the way Grand Juries are drawn under the existing government.

"Our Grand Juries might no doubt indict me. They won't indict anybody else. They refused to indict Gannon, the police captain we found sitting in the parlor of the Webster Hotel the night we raided it. The charge against Gannon was neglect of duty. The Grand Jury could not see that he had been negligent; yet the proprietors of the Hotels Dam and Jefferson, and thirty-one citizens living in the neighborhood of the Webster Hotel, had repeatedly petitioned Captain Gannon to stop the disorderly proceedings there. It was complained in the neighborhood that the disorder was so flagrant that old residents had been compelled to move away for the sake of their families. Yet Captain Gannon went his way unmoved, permitting the Webster Hotel to run in spite of all the protests of decent citizens; and why?

"Simply because he was getting the stuff for protecting it! He dares not deny this.

"We raided the hotel twice again after the raid on which we found Captain Gannon being entertained by the proprietor in the back parlor. But what is the result? The Webster Hotel is doing business at the same old stand, and the wives and daughters of citizens passing there or living in the neighborhood are exposed nightly to the insults of bad men and bad women, so that a man dares not take his wife or daughter past its doors except in a carriage. Yet the Grand Jury refused to find an indictment against Captain Gannon. What can you expect in your municipal government when there is corruption such as this in your Grand Juries?" [1]

Mr. Jerome himself was as explicit in attack as he had been in his proposals for reform. He was far from naming such persons and such bodies only as among reformers it had become customary and even obligatory to name. He named, as has been seen, the Grand Jury, he named the City Council, he named the Supreme

[1] Captain Gannon was last month dismissed from the police force, and, prosecuted by the District Attorney, was convicted by a jury in the criminal court of criminal malfeasance in office.

Court, he named the hidden powers behind the Supreme Court.

There were already in the Supreme Court, in Mr. Jerome's opinion, men whose honesty could not be trusted; and he dealt as boldly with the question of their honesty as with the question of their learning. He did so at his peril. "I know well," he said, "what all these statements mean to me if I am defeated and go back to private practice; but I do not mean to be deterred by that. There are certain men in the Supreme Court deserving all our respect and honor; there are certain men deserving neither respect nor honor. I am saying only what is known and currently commented on by members of the bar. At a meeting of the Bar Association I heard a lawyer say (and he mentioned the man's name) that there is a judge in the Supreme Court who is a tout for Richard Croker's insurance company. His words have never been challenged by that judge. To me, indeed, it seems that he was liable to punishment for contempt of court; but what he said has never yet been challenged. It is an appalling thing that any doubt should rest upon the honor of any judge of the Supreme Court." "Ask any honest lawyer," he said later, "how certain justices of the Supreme Court were nominated. Ask the members of the bar if they do not have to pick and choose between justices in any matter that affects the interests of the Metropolitan Street Railway Company." And, again: "I tell you there are judges in the Supreme Court in this county of New York of whom it is true that the most potent influence behind them is the Metropolitan Street Railway Company, which put them where they are. Ask any lawyer in large practice in this city who knows what the courts are, and he will tell you I am speaking the truth—the absolute truth."

If a distinction may be drawn between enthusiasm and attention, Mr. Jerome's audiences grew more and more attentive. The average American is somewhat cynically indifferent to venality in the subordinate members of the administration, but he is sensitive to anything that touches the integrity of the judiciary. The depredations of the unofficial licenser he feels that he can afford to suffer; the sponge story, the lemon story, the cravat story, were received with tumults of delighted recognition, but they aroused more mirth than wrath. With the police and their superiors he feels his own concern to be remote. But in every contract that he makes and in every credit that he gives he relies on the machinery of justice. He becomes uneasy at the notion that even a trial jury can be bought and sold; that a grand jury can be packed, that a Supreme Court can be tampered with, are statements before which he loses his last semblance of levity. Mr. Jerome spoke with a convincing accent of certainty and gravity; his audiences grew grave; the party managers on his own side grew more and more dismayed. What gave them pause was not the attack upon the courts, it was the attack upon the Metropolitan Street Railway Company. Mr. Whitney and his colleagues were accustomed to abstain from party politics; it was to their obvious interest to remain upon good terms with either party that might chance to have the upper hand. It was to the obvious interest of either party at the moment of election to be upon good terms with men who might well exercise so strong a vote-controlling power. On the 24th of October the New York "World" announced the formal adhesion of Mr. Whitney to the Tammany side; in an open letter he assured the Tammany candidate for the mayoralty of his support. His neutrality was plainly a neutrality between the two great standing parties, not between either standing party and a party of thorough-paced reform. His decision plainly had been taken because of the growing probability of the victory and of the thoroughgoingness of the party of reform. The newspapers were, many of them, of the opinion that by his decision the probability of that victory had been diminished or destroyed. The party managers of the Fusionists, many of them, held it for the time being their best hope that he might after all preserve a practical neutrality—that his support of Tammany might prove to be a formal and perfunctory support. Mr. Jerome, on the contrary, saw an opportunity to make good on his promises. He had spoken in public bitterly enough of the pernicious influence in public affairs of men like Mr. Devery and Mayor Van Wyck, of men whose acquaintance and personal friends

were not his acquaintance and personal friends, of men who were bound by neither social nor financial ties to his fellow-clubmen. In a spirit of even justice, in the consummation of his experiment in fearlessness and veracity, he determined to deal in utter freedom of speech with the men of power and leading in Wall Street and in the brownstone districts no less than with the men of power and leading in the City Hall and in the slums; with Mr. Whitney and Senator Platt no less than with Mr. Devery and Mayor Van Wyck.

"Is it any wonder," said Mr. Jerome, "that Mr. Whitney should at last come forward publicly upon the side of Mr. Shepard, when the platform on which Mr. Low is running contains a plank in favor of taxation of public franchises?—not, indeed, of any anarchistic scheme of confiscation under pretext of taxation, but of a just system of taxation by which those deriving benefits from public franchises should pay the people a fair price for benefits derived? Is it any wonder that Mr. Whitney and the interests he represents should be arrayed against the Fusion party, when they know that if they can defeat it they can buy their way as heretofore, and that if it cannot be defeated they cannot buy their way?"

"There has come into this campaign," he said to another audience that same evening, "an element so significant that I intend to say no word in any public place to-night except on this new theme. In its importance it very far transcends the brutal ruffianism of Devery and the blackmail levied by captains of police. It may seem to you far less picturesque and interesting, it may evoke no cheers—but cheers are useless things. If you will take the remembrance of it home with you, it will gradually assume the same importance in your mind that it bears in mine.

"This new element is the support given publicly by William Whitney to Edward Shepard. The support given by Mr. Whitney is support given by the Metropolitan Street Railway Company; the intervention of the Metropolitan Street Railway Company is the intervention of the money power. It means that money will be spent at this election as money has been spent to buy our City Council and to buy our Legislature and to buy our Supreme Court. It means that the results of this election are in so far endangered. So vast are the resources of Mr. Whitney and the Metropolitan Street Railway Company, so strong is money ruthlessly expended, that the newspapers are loud in comment on the value of the reinforcement brought to Tammany, and my campaign managers are pleading with me to say no word of Mr. Whitney or the Metropolitan Street Railway Company that may provoke them to direct their vast resources more heavily against our side. My campaign managers, for aught I know, are right in the matter of expediency. I never have known anything about electioneering, and I am not here to play a game I do not know. I am here to play the only game I know—the game of telling the truth. If by telling the truth I lose the fight—why, later, there will be another fight. But to me it seems that nothing could have served so well to show the real nature of the fight in which we are engaged as just this support given openly to Tammany by the Metropolitan Street Railway Company. There are many people in this city who love Tammany because they have been told that Tammany is the poor man's friend. There are not many people in this city who love the Metropolitan Street Railway Company; and this avowed support of Tammany by the Metropolitan Street Railway Company comes just in time to show the blindest who the friends of Tammany really are. The grafter never yet was working in the interest of the poor and honest man; he is certain to be working in the interest of the man that has the stuff. And that is why the fight for a dishonest administration never can be a people's fight. If anybody has been weak enough to fancy that there may be dishonest politicians whose dishonesty is for the people's profit, let him disabuse himself. The dishonest politician is certain to be working with the richest grafter whose spoils he has a chance to share; and in this country the richest grafters are the rich corporations that rob the people of their rights. The fight against the grafters now in office is a fight against the money power. Don't misunderstand me. I don't want your vote under false pretenses. Don't take me for an Anarchist or any other clap-

trap fellow trying to bid for votes. There is no judge upon the bench and no private citizen who has stood more steadily than I, within the limits of such power as I could exercise, for the sanctity of property. I am not attacking corporations simply as corporations. I believe that in the present economic organization of society corporations are absolutely necessary to carry on the business of this or any other community; I believe that without them it would be impossible to bring together the great aggregations of capital that in the economic world are necessary to the winning of your bread and mine. I am not even attacking trusts. They may be expedient, they may be inexpedient; I believe that they are inevitable developments of the conditions of the modern economic world, and that we shall learn to manage them so that they shall serve the people's interests, as we have learned to manage other facts and forces of the material world. I do not believe in subjecting corporations to any form of extortion, legal or illegal. They have their rights; other people have theirs. But when their vast resources are expended to gain possession of our Legislatures and our courts, and even our ballot-boxes, then it is time to call a halt; then it is time to spring to the defense of our rights against the money power. You can call a halt by your ballots, if you will, the sixth of next November; you can never call a halt by criticism and comment. Criticism and comment take as little hold on corporations as on politicians. The giving and the taking of bribes are criminal offenses; you can call a halt by voting for an equal and impartial enforcement of the law."

"The little looters!" he exclaimed at still another meeting that evening: "what are they to the octopus that holds the whole city in its grasp? I have at heart the suppression of vice in this city; I have at heart the suppression of crimes of violence in this city; I have at heart the suppression of public gambling in this city; but far more deeply than any or all of these, I have at heart the liberation of this city from the power that systematically corrupts its public service—corrupts the courts, corrupts the Legislature, corrupts the City Council, and seeks to keep in power against the people's will such men as it has found it can corrupt." Evening after evening he reiterated the same charges, evening after evening the applause swelled louder. But on October 30th, without the smallest warning to any friend or counselor, he began the chief speech of the night with words which to the minds of all his friends spelled ruin. It was one thing to attack Mr. Whitney: Mr. Whitney was, when all was said, a Democrat, and a Democrat already formally enlisted on the side of the Democratic political machine. The fusion was a fusion of the whole Republican party with a portion of the Democratic; the political machine on which the Fusionists relied was the Republican machine. The mainspring of the Republican machine, supposedly or actually, was Thomas Platt. "There is a man by the name of William Whitney," Mr. Jerome said that evening, as the beginning of his speech in Lyric Hall, "and there is a man by the name of Thomas Platt, and the man named William Whitney and one Ryan of evil State Trust fame met to-day; and they conferred; and when they had conferred they sent for Thomas Platt, and Thomas Platt went to that office. He is a man more accustomed to send for others than to go to them. He went up in the back elevator, and was taken to the private room of William Whitney, and then William Whitney and Thomas Ryan, who had been waiting in the office of the Morton Trust Company, went to the room where Thomas Platt was, and they conferred.

"Now, I have no use and never have had any use for Thomas Platt, any more than for Richard Croker or for William Whitney, and I tell you this to-night because it serves to show you how things stand, and because I believe that if the people of New York knew really how things stand, they would arm our hands at this election against corruption both Democratic and Republican.

"It may be that they conferred about the parallax of Jupiter or the dark side of the moon, but they didn't. It may be that Mr. Whitney talked with Mr. Platt about the Philippine Islands, but he didn't. He talked, as I believe, with Mr. Platt about the District Attorneyship of the County of New York. Mr. Whitney's memory is not so short that it

cannot go back to the days, scarcely a year ago, of the State Trust Company, when a loan of $2,000,000 was made to D. F. Shea, an office-boy of Thomas Ryan, though that loan was forbidden by the State of New York, and was, in consequence, a criminal transaction.

"It is no new thing, the alliance between Tammany Hall grafters and Republican grafters—or do you think that graft is a monopoly of Tammany Hall? Do you think the rule of Thomas Platt is any better than the rule of Richard Croker, except that the one may be compared to petty larceny and the other to grand larceny? I have had occasion to know something of the power of bosses in this city, and I have seen the fair fame of the city prostituted year after year by infamous collusion between the persons who misrepresent the Republican party and the persons who misrepresent the Democratic party. It is no new thing, the alliance between the bosses upon either side and the alliance between those bosses and the money power. But do you realize what that alliance means? There are sincere men, and I am one of them, who believe the principles of the Democratic party essential to the welfare of the country; there are sincere and loyal men, and many of them, who believe the principles of the Republican party essential to the welfare of the country. Such men must fight it out together at the polls, and may be content to fight it out together loyally, with a true, square count. But in the meanwhile in a back room there sit in conference a little group of men who have control of the elections and decide the questions we contend about, with no regard to principles at all."

That speech in Lyric Hall was given under the auspices of a local Republican organization. The audience enjoyed it, but the faces on the platform went white with dismay at the first mention of Senator Platt. The chairman, who had said the prettiest words he could command a few minutes before and sat down smiling, looked as if he had just discovered that some one had been making a fool of him. He was a big man, with a big face that lent itself to angry expression; he had the aspect of a disappointed, savage bulldog, held back by a collar and chain from a go at his natural prey. The foolishest faces on the platform were those of Mr. Jerome's own party. They sought one another's eyes for a time in mute amazement. Finally they found speech—in whispers. "It looks as if I had seen a man commit suicide," said one; "he is either a martyr or a hero." "Suicide! He has killed the whole ticket along with himself. Why didn't you stop him off?" This inquiry was addressed to the writer, because he had happened to be alone with Mr. Jerome in the carriage when he arrived at Lyric Hall. The notion of stopping him off from saying anything he had made up his mind to say, which would in any case have been amusing, was in this case the more so since he had not dropped a word of his intention to name Senator Platt. He had said only, as we neared our destination, "Hodder, I am going to put the fat in the fire." I said that I was not surprised, that he had been doing nothing from the beginning of the campaign but put the fat in the fire. "It makes small difference," he answered, with an accent of brooding meditation that was by no means usual with him, "whether Low and I be elected; it is important only that some one have the pluck to tell the people the truth;" and he jumped out of the carriage.

There was nothing improbable or even unusual in the sort of understanding between political adversaries which Mr. Jerome was thus ascribing to Mr. Platt and Mr. Whitney: it was precisely because such compacts are become a commonplace of politics, and yet are unfamiliar to the public, that this one with overwhelming force seemed to him to point a moral and to symbolize a danger. It is between the rank and file of either party that there obtains in matters politic a warfare to the death. The leaders on either side—not the orators, but the true leaders, the men who govern the machine, the men who constitute the power behind the throne—are for the most part on amicable terms. The Republican machine is to all intents and purposes a trust; the Democratic machine is to all intents and purposes a trust; like other trusts, they pool. When the Republicans come into power, most offices, but by no means all, go to Republicans; when the Democrats come into power, most offices, but by no means all, are given to Democrats; the distribution

of places is arranged by conference between the opposing powers. Before election the distribution of votes is not infrequently arranged in the same manner: one candidate is sacrificed to save or to defeat another candidate of more importance. In the last days of the campaign precisely such a compromise was openly attempted and enjoined by Tammany for the defeat of Mr. Jerome. The instructions that went out from Tammany headquarters were to trade votes in any manner that would keep the District Attorney's office safe. That the District Attorney's office should be friendly, or at least quiescent, is a matter of supreme necessity to all the systematic violators of the law; it is necessary, not indeed for their immunity—the District Attorney is far enough from being omnipotent—but for their peace of mind. Witnesses may be suborned or else removed, be the District Attorney and his staff never so active or so vigilant; juries and judges still may intervene between the offenders and the law. But between the indictment and the verdict, and even between the beginning of the investigation and the formulation or abandonment of the indictment, the violators of the law are sure to pass unquiet hours. It is worth to them whatever it may cost to go their wonted way in peace.

The next morning there were published interviews with Senator Platt and Mr. Whitney denying that they had been recently in conference, and newspapers which had given Mr. Jerome steady support dealt in unfriendly criticism. Men who had worked for him and candidates on the ticket with him visited his headquarters with long faces. Word came that Senator Platt had given orders that he should not be permitted to speak in any hall controlled by the Republican organization until he had publicly recanted and apologized. Practically every one held him to blame for two things: for sacrificing a notable career for himself, and for jeoparding even his associates on the ticket, both for a freak of temper. I set these things down because they place in high relief the fact that the men who are to reform American politics must be prepared at times to stand alone. I asked Mr. Jerome that same day what had, in his own eyes, justified him in making that speech. His offhand reply was: "If Platt wants a fight, he can get it. I was not going to wait for him to strike the first blow. I do not want public office badly enough to be a puppet in the hands of any man or set of men. I am not making this campaign to win out as District Attorney; I am making it to tell the people of New York the things they ought to know." Later in the day there came to visit him at headquarters a man in whose integrity he was known to have implicit confidence, commissioned to assure him that to his personal knowledge there had been at the conference in question or elsewhere no consultation or agreement between Mr. Platt and Mr. Whitney with regard to any political matter whatsoever. That the secret conference had taken place was by this informant not explicitly denied. There are persons who still affirm themselves to have good and sufficient reason to believe that the subject of the conference was in fact precisely that declared by Mr. Jerome, and that a conspiracy was in fact defeated by being brought so soon and so audaciously to light. Mr. Jerome himself accepted his informant's word. "I have received assurances," he said that night at his first public meeting, "from a gentleman who is in a position to know, and in whose honor and integrity I believe, that at the conference of which I spoke last night there was no discussion between Mr. Platt and Mr. Whitney of any matter bearing on this election. These statements I accept. I am satisfied from the assurances that I have received to-day that the Republican organization in this city will loyally support the whole ticket—the whole ticket, without exception; and that the returns on election day will show this support to have been given. To this extent I qualify what I have said, and to this extent only. What I have said, as it touches the broad facts and issues of our politics, I stand for, if I stand alone."

The attack on Senator Platt and Mr. Whitney was in a manner the turning-point of the campaign. For Mr. Jerome himself it was a turning-point. In the attack on Senator Platt he had at last given complete expression to his own conception of the essential nature of the

state of things to be reformed. He had made appeal to those, and to those alone, by whom alone, as he believed, it could be lastingly reformed. He had made appeal to the unattached, plain man. He had grown weary of inveighing against Tammany and only Tammany. The Tammany administration was corrupt; he had fought and was fighting with a will to have it overthrown. He was far from dreaming that the battle of reform would have been won when Tammany was overthrown. He knew well that in Tammany lay neither the sole root nor the sole fruit of the administrative lie. He knew well that no system different in essentials from that of Tammany ever has existed, or will ever enduringly exist, under the sway of the administrative lie. The government of the city, he had repeatedly declared, was in the hands of a gang of criminals; it is an exact description, from a legal point of view, of illegal licensers and liberal enforcers of a mendacious law. Besides the gang of criminals actually in power, there is sure to be at least one other gang of criminals that has been and still desires to be in power. As against the plain people, there was to his thinking a natural alliance between the rival gangs, as also between whatever gang might chance to be in power and the richest violators of the law. The difficulty lay in bringing home to the plain man the fact of this alliance and its scope; the difficulty lay in rousing the plain man to a sense of his own interest in the strife and to a sense of his own power. The hostile intervention—the at least apparent hostile intervention—of Senator Platt, the open hostile intervention of Mr. Whitney, had given him his opportunity, without departing from the question of the hour, to make appeal with passionate explicitness to the plain man against the plain man's natural foes. The attack on Senator Platt had been to the plain man a convincing proof that here was not the ordinary office-seeker, with a loud voice and much to say of the iniquities of those upon the other side. The applause that in a virtually Republican mass-meeting rewarded the attack upon the party chief of the Republicans was a convincing proof that the plain man in every party was prepared to stand by the man he found that he could trust. There had been applause for Mr. Jerome, and vehement applause, from first to last whenever he appeared; but never such applause as when he struck into a course in which it was supposed that he would find himself alone.

Those who were about Mr. Jerome in the few remaining days of the campaign must often have had running in their minds the well-worn lines descriptive of the "happy warrior;" he, too, was "happy as a lover," and was "fired with sudden brightness, like a man inspired." His energies, astonishing before, seemed quadrupled; he spoke at even more meetings, he spoke longer; what his speeches lost in picturesque detail they gained in impetus and scope. In every speech he pressed home his appeal to the plain man. In the very experiences, the very preoccupations, that had seemed to separate him from the generality of men, he found a vital ground of unity with the plain people of the land. There is small difference of opinion concerning the main outlines and enactments of the criminal law. There is small difference even of feeling, except as feeling may be found dishonorably inert or honorably strong. In the broad lines laid down by the criminal law he found the lines of demarcation between the party of the criminal and the party of the plain people of the land.

"They tell me," he said, in response to his applauders at the Murray Hill Lyceum, "that I should have made none of the speeches I have lately made. They tell me I have been needlessly arraying against our cause great and powerful enemies. But I judge your hearts by mine, and I think that there are enemies whom it rejoices and exalts and fortifies men's hearts to encounter face to face. I think that the great corporate interests that have entered into a corrupt alliance with corrupt politicians to despoil the people of this city of their rights have not waited until these last days of the campaign to know which side to fight on, and that it is for the people of this city of the last importance, and animating and invigorating and well-omened, to know at last beyond a peradventure on what side those interests mean to fight. In finding them

arrayed against us we find arrayed against us interests which the hearts of men love to defeat."

"By happy force of circumstance," Mr. Jerome said on November 2 at Cooper Union, "this campaign has grown in visible importance since the day it was opened in this hall until to-night. Its issues have been defined more and more imposingly, until they have been seen to merge themselves in one great issue, not whether this or that man is the better, not whether this or that man is less vile than in his public actions he seems to show himself to be, but whether the American people is fit to rule itself under democratic institutions. We have had as yet only a hundred years of so-called self-government, and we are just attaining our full growth as a Nation; and the hour of our trial is at hand.

"Within the memory of man there has been no campaign fought on the line of this campaign, and if at the election it is not plain beyond a doubt that we have had the people with us, I believe that there is no man here to-night who will live long enough to see a great campaign fought on these lines again. There has been implicit faith put in the plain people; there has been not one single word uttered that is not absolutely true; we have fought a clean fight, every one of us, from start to finish; and it is for the plain people of this city to decide what shall be the outcome of our fight.

"Not that in my heart I have one instant's fear of a defeat. I believe with all my heart, unswervingly and absolutely, that the plain people Abraham Lincoln trusted to the end of his magnificent career are to be relied on now as then to see the fact and do the right. I have been taught, boy and man, that rectitude means something; that on it, in their hour of trial, human beings may rely. I may be young and an enthusiast, as they tell me; but I have had time to know all sorts and conditions of men in this great country, and I have had time to read nearly every word the fathers of this country ever spoke or ever wrote; and the wise men may be right who tell me that I am doomed to disappointment; but I do not think I am. The plain people are slow to judge, and rightly; they are slow to act, and rightly; but here in this city they have had before their eyes for long years the actions and the lives of the gang of criminals that rules it, and I think the fullness of the hour is come.

"There is no controversy possible about the acts of the administration that we have been living under; there is a question only whether acts like those shall be continued and condoned. And I believe that God Almighty placed in all men's hearts a clean-cut line between right and wrong; and that when an appeal is grounded, not on this man's merits or on that man's merits, but on those eternal laws that will remain immutable when you and I and all of us are gone, the hearts of English-speaking men throughout the habitable globe are certain to respond."

[TO BE CONTINUED]

They Keep His Memory Green

By Robert Truslow

In days of old, as legends tell,
By ancient fane and holy bell
There dwelt a saint all men loved well,
Good Bishop Valentine.

Three maidens fair within his see
There were, and hapless lovers three,
For, by paternal stern decree,
Each girl remained alone.

The maids were caged in towers high,
Their fathers let no youth draw nigh;

So youths and maids could only sigh,
For writing was unknown.

Relief for love in such a plight
The holy man sought day and night,
In sorrow at the piteous sight,
Till help he could divine.

At length he hit upon a plan
By which an absent lover can
Avow his passion like a man,
With none to say him nay.

In short, the saint invented ink—
A sheepskin smooth the scroll, I think—
He passed them over with a wink;
A goose supplied the quill.

So, on the saint's own festal day,
The postman staggers on his way
'Neath reams of tender roundelay;
No doubt he always will.

Thus lovers keep his memory green.
Such constancy is strange, I ween,
But youth is fond and love is keen;
So runs the world away.

The Unconquerable Habit

By Theodore T. Munger

THE finest line in Emerson's greatest poem, "The Problem," is: "Himself from God he could not free." In itself it has no poetic merit, but it is the key-word that solves the problem which ever vexes the mind of man until it is referred to God. Emerson, in these oft-quoted lines, sets forth the greatest achievements of man and of nature as well, and explains their wonder by putting each one in some relation to the world of the spirit. The scope, the splendor, the insight of the poem are immense. It vindicates what we have called the unconquerable habit of prayer. Whatever great thing is done, is done through God.

In order to put the same truth in like relation to personal life, we place beside it a once familiar hymn by Mrs. Phœbe Brown:

I love to steal awhile away
From every cumbering care.

It is infinitely below Emerson's great lines in poetic value, but far above them in meeting conscious human necessity. Its meaning is lost in its homely simplicity and the very depth of its humility. Emerson's central thought is overwhelmed by the splendor of the entire poem. Together they cover the two sides of prayer—one, the unconquerable sense of God; the other, the unappeasable desire to commune with God.

Nothing is more deeply wrought into us than the instinct of prayer. No matter what first prompts it: let the theories go, and trust the fact; pray man always has, and pray he always will. Some astonished reader who has not breathed or thought a prayer since childhood may quote himself as the refutation of this assertion. Nevertheless, there will come a time when he will pray, even if in some extreme moment it be but "the upward glancing of an eye." Still, it must be confessed that man is so wonderfully wrought that he can turn upon himself and extirpate his highest faculty or put it

to a sleep that seems death; nature has room for monstrosity. The habit of prayer is a part of the contents of human nature. We may toss it out of the window of science or of metaphysics, but it will come back. We may let it lie, a forgotten thing, in some corner of our house; or set it down as a superstition and quote as proof its prevalence among the benighted the world over—as if universality were not the infallible sign of a truth; all this may be, still from God ourselves we cannot free, even if we never steal away from our cumbering cares to commune with him. Prayer has fuller expression among the untaught because there is a simpler play of nature; instinct more freely asserts itself—like the motions of the babe at its mother's breast; but these instincts are the roots of our strongest passion. The immense variety of its forms is the pledge of its reality. What is universal is absolute. It may sink to such a depth as prayer-wheels and numbering rosaries, or rise to the ecstasy of St. Agnes as she sends her breath to heaven on her frosty eve; it may run into all sorts of vagaries; but one simple fact is clear all the way through—man will pray, and will not suffer himself to be kept from it. If it is sometimes gross; if it misses the idea of importunity, and lapses into thinking that it will be heard for much speaking, or that if simultaneous it has special power; or if it clothes itself in ritual robes that seem to smother its breath, still its central character is not lost: it is still humanity bowing before its Creator and turning to its eternal and infinite Friend.

It is a poor question to ask, Is prayer for gain, or does it gain anything? Does it spring out of weakness or fear? Poor questions because they overlook the poverty and weakness of humanity as it turns to its only possible helper. Prayer is as natural and simple as the cry of young ravens to God for their food. The correlation of prayer to humanity, rising out of simple and unmeaning forms and growing rational as man advances toward his ideal, until at last he cries, "Whom have I in heaven but thee, and there is none upon earth that I desire beside thee," is a fact with which we must settle before turning it over to mere piety, or dropping it out of our lives.

It is strange that the beauty of prayer is so overlooked by present-day thought. The poet never misses it. In the long run the poets win the great human verdicts. What they bind remains fast. They know that the beautiful is the true. In all ages and the world over, the bowed head, the bended figure, the folded hands, the upturned eyes, have not only commanded reverence but stirred a sense of mingled charm and awe as if some mystery were unfolding. The artist studies the picture long, for he is never deceived by a fiction, nor does he stop to admire unreality. When one chances—as may happen in other lands—to pass a wayside shrine where a poor woman has bowed to pray for her sick child, or an old man stops to rest both body and soul, one's heart joins in the prayers, whatever the head may think of it—from God ourselves we cannot free. The prayers make the ground holy where we stand, and the trees glow with indwelling Deity.

There is a verse in the New Testament that one cannot read—if he will pause a moment upon it—without a sense first of wonder and then of awe: "He went out into a mountain to pray, and continued all night in prayer to God." We are accustomed to-day to think of Christ as a divine humanist. Whatever else we may believe, we are agreed upon this: he was humanity itself at work with every faculty—no mystic, no debater in the schools, but a servant of humanity down to the last detail of service, the busiest and the most practical of men, always among the people, and apparently with no thought but for them. Not wholly so, however. Service was his passion; but he had another passion—a passion for God. The calm ecstasy of a vision of God was upon him, and he could not break it until day dawned, when—full of God—he went down to his work again. We are here not in the region of miracle, nor even of religion as we name it, but of pure and perfect humanity—doing the thing most natural and most necessary to itself. To pray is natural. To fail in it is to fall short of humanity—not utterly, perhaps, but to miss its glory and its strength.

The Teaching of English[1]

THE Gradgrind philosophy which sets a value only on facts and tangible realities, which would cultivate only the motives of reason and self-interest, Dickens, long ago, in "Hard Times," reduced to the absurd. And yet the dominance of the scientific influence in our modern education, in some regards, has resulted in a subtle and drastic application of this Gradgrind philosophy. Science presents only one of the dual visions of life, and it can educate but a part of the human mind. When restricted to its own legitimate field, it is a beneficent factor in the highest education, but when uncompensated by the things that appeal to the heart and the imagination, it is likely to produce disciples of the Gradgrind school. Man cannot live by bread alone.

In former times the humanities were taught largely by the study of Latin and Greek, and in these literatures were found those ideals of culture that minister to the spirit. Of late, Latin and Greek, alas! have come under the incantations of the scientific spell, and they have lost, in large measure, their humanitarian prestige and power. So much so, in fact, that in that grim stronghold of conservatism, Oxford University, the policy of dropping Greek from the requirements is at present under very serious consideration.

It is at this point of readjustment, when science seems unduly in evidence, when the classical sources of influence are passing with the gods into the twilight of obsolescence, that the apostles of the humanities have turned to English as a champion of their cause; and from the present outlook, English, so long neglected, because, it was argued, it should be absorbed rather than taught, will soon take the place of primacy among the humanitarian branches of learning. The battle is on; it is being fought in the class-room of school and college, and the growing enthusiasm among teachers and scholars is the best sign of promise.

Mr. Percival Chubb, in his volume, "The Teaching of English,"[1] is the historian of the struggle and an ardent director of the tactics. No one can read this book without being impressed by the rare personality of the author. He writes with the zeal that indicates a dedication to a noble calling, and in that broad spirit of tolerance that loves science not less, but English more. He has that most desirable of virtues, a militant "sweet reasonableness," and he pleads his case with the fine discernment of one chosen for a mission. The teaching of English he conceives to be valuable "for its large culture values, and above all for its character values—for the spiritual enlargement, clarification, and discipline of young hearts and minds and wills which are to be touched to the finer issues of its potent ministry." He looks to English, for the future, as the most effective force in the higher education.

The school children, in his view, should be treated as "primitive little people." And as the ancient races fed their consciousness on nature and folk-lore, before the coming of science and philosophy, as they lived in their imagination rather than their reason, so, in the instruction of the child, the first stress should be on the literary and the poetic, and not on the mere utilitarian facts of knowledge. The epic interest of the heroic, the love of things out-of-doors, the saving hygienic relish for humor—these the author would select for the cultivation of the immature mind. The discipline of the reason and application of the laboratory methods, now so much in vogue, he would defer until the child, like the fresh, unspoiled children of the forest, has acquired, through the healthy development of the imagination, that roseate hue of vision which makes him the "best philosopher, the eye among the blind."

Mr. Chubb desires some changes in the kindergartens. In their striving for simplicity, like Wordsworth's unsteady muse, they have often indulged in simpleness. Too often the kindergarten has introduced "doggerel for poetry and tum-tumminess for music." In its endeavor to exclude the questionable, it has cut out the pith and marrow, and has crippled the good

[1] *The Teaching of English.* By Percival Chubb. The Macmillan Co., New York.

old stories by unwise editing. "The shadows of tragedy and pathos have been dispelled, and a world of vulgar high lights substituted: Red Riding Hood has been surgically rescued from the wolf's stomach, the Children in the Wood have been saved and respectably married, and, in short, ethical and artistic violence done to much legend and myth that has embodied the higher instinctive wisdom of the race. To such an inane, gingerbread world has the child who knows cut fingers and stubbed toes been introduced. Because he quails before darkness, we turn on the lights, and always keep them burning." He opposes the kindergarten surgery that lops off and maims. He would choose the good old things, and let them stand.

In America the teacher of English, the writer notes, faces an indigenous problem. Teachers of mathematics, of geography, and other branches can sow their seed on virgin soil without fear of counteracting influences. But in the case of the native tongue the teacher must offset the constant effects of a more or less inimical social environment. The Americans lack linguistic conscience; they have little pride of language form. The pupil who is taught correct speech a few hours a day in school returns to a world, and often to a home, that adopts cheap colloquialisms and vulgar slang with easy virtue, and that inevitably soils the linguistic ideals of the class-room. The pupil thus reverts insensibly to illiteracy, after the model of his elders, and leads a life of Jekyll and Hyde dualism in the matter of language.

For this reason Mr. Chubb urges the necessity upon parents of co-operating with the teacher. His book, although addressed to the profession, should be read by all those guardians who wish to do their whole duty by their wards; for even a passing study will put them in touch with that work in our primary and high schools which is most directly influential upon character.

The recent epidemic of interest in all things American has not been confined to writers of fiction. Histories of our literature have lately appeared in goodly numbers, sufficiently so to indicate that we are now truly in the midst of a revival of American learning. One of the latest of these books is by Professor Sears, of Brown University.[1] A feature of his volume is a happy combination of a series of illuminating criticisms and illustrative extracts. The style is brilliant, although sometimes a little self-conscious and strained, and the method of treatment throws emphasis on periods of our literature which have hitherto been passed with a glance. The first part of the book, the review of the Colonial production, is decidedly the most striking, for in it the author has aroused a curiosity for what is usually neglected as a field rank with useless weeds. It is a difficult matter to arouse an interest in the forgotten dead. But Professor Sears has written of our Colonial historians and diarists so contagiously that the reader is inoculated with the antiquarian's enthusiasm for the shelved and dusty volumes of our ancestors. The characteristics of the Puritan literature, he remarks, are a mixture of force, piety, enterprise, and bad grammar. At first it was pietistic, then polemic, and finally pugilistic. The writers lived life so intensely that "all the details stand in the foreground like a Japanese landscape."

The latter part of the book, which deals with the writers of accepted standing, is less noteworthy. Professor Sears is more safe and traditional than Mr. Barrett Wendell; yet, it must be observed, he is always interesting. The union of these qualities makes his book an admirable one for academic use. In fact, for advanced classes it is the most adequate history of American literature that the reviewer has ever read. It has all the necessary virtues in moderation.

Books of the Week

This report of current literature is supplemented by fuller reviews of such books as in the judgment of the editors are of special importance to our readers. Any of these books will be sent by the publishers of The Outlook, postpaid, to any address on receipt of the published price, with postage added when the price is marked "net."

Agnosticism. By Robert Flint. Charles Scribner's Sons, New York. 5¼×8 in. 664 pages. $2, net.

Dr. Flint's eminence among representative writers upon Theism commands attention to his treatment of Agnosticism. No writer that we are aware of has treated it so amply and thoroughly as here. Its history, erroneous views of it, its distinguished representatives, its various forms, its relation to various subjects, are successively discussed both critically and constructively, so as to illuminate the validity of theistic belief. In this process much wood, hay, and stubble in the work of Christian theologians is swept away. It is a severe judgment that is passed upon the current Ritschlian theology, pronouncing its foundation "anti-scientific and anti-rational to the core." The argument for theism has gained cogency from the labor spent upon it during the past generation. Deism, as Dr. Flint says, has been displaced, and theism has been enriched with what is true in pantheism. Nevertheless, agnosticism in one form or another will long keep in the field, so numerous are the points that supply it with opportunity, all speculative thought being concerned with ideas that are involved in the idea of God.

Albrecht Dürer. By Lina Eckenstein. Illustrated. E. P. Dutton & Co., New York. 4×6 in. 261 pages. 75c., net.

Reserved for later notice.

Children's First Story Book (The). By May H. Wood. Illustrated. The American Book Co., New York. 5×7½ in. 80 pages. 25c.

Colonel Washington. By Archer Butler Hulbert. Illustrated. Published from the Income of the Francis G. Butler Publication Fund of Western Reserve University, 1902. 5×7½ in. 58 pages.

Civilization in Congoland: A Story of International Wrong-Doing. By H. R. Fox Bourne. P. S. King & Son, Westminster, S. W. London. 5¼×8½ in. 311 pages.

In his introductory note to this volume Sir Charles Dilke says that the Congo State, as at present constituted, is in a worse condition than Portugal itself would have maintained. This condition has been brought about by Belgian inhumanity towards the natives; and the aim of Mr. Fox Bourne's book is to direct public attention to the scandals and offenses in the Congo State against which the Aborigines Protective Association (of which Mr. Fox Bourne is Secretary) has been protesting. The book includes not only an appallingly long list of outrages which are no longer denied, but also an account of the Congolese from the earliest time to the advent of the Portuguese, a discussion of the slave trade, and a description of Sir Henry Stanley's explorations and the development of the plans of King Leopold of Belgium, culminating in the Anglo-Portuguese treaty of 1884, the intervention by the United States Government, the Berlin and Brussels Conferences.

Continuous Power the Natural Result of Converting Heat into Work, in an Insulated Expansion Engine, at Temperatures Below the Normal of the Atmosphere. By J. F. Place. Illustrated. (Revised Edition—Tenth Thousand.) The Standard Power Co., New York. 7×9¾ in. 48 pages.

Derby Anniversary Calendar (The): Being the Records of Six Thousand Noteworthy Events, Anniversaries, Birthdays, etc., in American History. Compiled and Edited by George Derby. James T. White & Co., New York. 4×5¼ in. 366 pages. 50c.

Despatches of Field-Marshal The Duke of Wellington: During his Campaigns in India, Denmark, Portugal, Spain, the Low Countries, and France, and Relating to America. Selected and Arranged by Walter Wood. E. P. Dutton & Co., New York. 6×9¼ in. 475 pages. $3.50, net.

The editor of these despatches has done his work with credit to himself and with satisfaction to the reader. He has chosen the most interesting passages from the despatches of "our greatest soldier," as he calls the Duke of Wellington. The despatches cover the Duke's campaigns from 1799 to 1815, and cover such widely differing regions as India, Denmark, the Spanish Peninsula, the Low Countries, and France. While the account of Waterloo may attract widest popular interest, the despatches concerning the necessarily rigorous and well-nigh savage discipline of the Peninsular army possess peculiar impressiveness, and incidentally confirm some accounts in Napier's history.

Education of Christ (The): Hillside Reveries. By W. M. Ramsay, D.C.L. G. P. Putnam's Sons, New York. 4½×7 in. 138 pages. $1.

In paper, print, and binding, this seems an ideal little book. The text matches the material incorporation, a text to appeal not only to every religiously and devoutly minded man, but also to every æsthetically and sanely disposed man. The "Impressions of Turkey" showed us that few if any writers could claim a more intimate acquaintance with Asia Minor than can Dr. Ramsay. The present volume well reflects his intimacy with that region and with Palestine. More clearly and insistently than in any other land, the philosophy of history, "the will of God as wrought in the world," is written in the landscape of Palestine, and the rightly educated mind cannot but read it there. The country was a decisive factor in making the people who lived in it; and, thinks Dr. Ramsay, had a notable influence on the mind of Christ. The Child of Nazareth must have drawn inspiration and lessons from the scenes in view of which he grew up to manhood. Speaking of the educational ideals of Christ's day, Dr. Ramsay has an opinion worth quoting. If the Græco-Roman world was decaying and dying from

the dearth of true educational ideals, among the Hebrews, on the other hand, there was a salutary, invigorating system of natural education. "Only among them was the principle firmly grasped and boldly enunciated that the poor man's son had as much right to be educated up to his true capacity as a rich man's son, and that both alike should be taught to work." It is true that an admirable side of the Greek lay in his grasp of the principle that it was the duty of the State to educate its citizens. But the education provided was, according to our author, narrow in conception, shallow in character, and destitute of a vivifying ideal. As for the Roman system, adds Dr. Ramsay, its one educational aim seems to have been to prevent the mass of the people from thinking too much, and to provide them with abundant amusements.

Electra. By Benito Pérez Galdós. Edited by Otis Gridley Bunnell, M.S. The American Book Co., New York. 5×7 in. 185 pages. 70c.

Elements of General Method (The): Based on the Principles of Herbart. By Charles A. McMurry, Ph.D. (New Edition, Revised and Enlarged.) The Macmillan Co., New York. 5×7½ in. 331 pages. 90c.

A valuable work, and recognized as such by progressive educators. The relative value of studies, and the engagement of the pupil's mind or "interest," are the topics to which the most space is devoted. One sentence must be quoted: "For moral educative purposes in the training of the young, the history of America, from the early explorations and settlements along the Atlantic coast to the present, has scarcely a parallel in history."

Eschatology. By Rev. C. A. Huntington, Eureka, Cal. Jewett Bros., Eureka, Cal. 7×10 in. 19 pages. Paper bound.

For a Maiden Brave. By Chauncey C. Hotchkiss. Illustrated in Colors. D. Appleton & Co., New York. 5×7½ in. 373 pages. $1.50.

Another story of the American Revolution, certainly a field somewhat overworked of late by novelists. The Long Island campaign in 1778 furnishes most of the historical material, but scenes of interest occur in New York and New Haven. The author has considerable story-weaving talent, but gives us a little too much plot, while his characters incline to sentimentalism and verbosity in their talk.

Frederic Lord Leighton. By George C. Williamson, Litt.D. (Bell's Miniature Series of Painters.) The Macmillan Co., New York. 4×6¼ in. 56 pages. $1.

Reserved for later notice.

French Revolution (The). By Thomas Carlyle. In 3 vols. Illustrated. The Macmillan Co., New York. 5½×8½ in. $9, net.

The important features of this reprint are the introduction and notes furnished by Mr. J. W. Rose, whose "Life of Napoleon the First" is one of the most important contributions to the study of the French Revolution made of recent years, and, indeed, at any time. Mr. Rose is entirely familiar with the section of history covered by Carlyle's picturesque and striking work. In a very interesting introduction he indicates the steps by which Carlyle was led to take up the subject of the Revolution, the books from which he derived the larger part of his material, his attitude towards the Revolution, with a very keen and convincing analysis of those aspects of the great tragedy which appealed to him, and in the delineation of which he showed masterly strength. The introduction is valuable as a criticism of Carlyle's work, bringing out as it does both the strength and weakness of its powerful interpretation. Mr. Rose has supplemented and occasionally corrected Carlyle's narrative with the aid of the most recent knowledge in the form of foot-notes. Taking into account the fact that Carlyle gathered his materials in 1837, when those materials were scanty as compared with the wealth of material at hand to-day, his narrative bears the test of modern investigation astonishingly well; but there are some errors, and those errors Mr. Rose has corrected in his notes, and has brought together for the benefit of the reader a vast amount of information relating to references historical and otherwise. The three volumes are well printed and tastefully bound, and contain a number of very interesting portraits. It will be remembered that Carlyle placed portraits among the most important historical data.

Greuze. By Harold Armitage. (Bell's Miniature Series of Painters.) The Macmillan Co., New York. 4×6¼ in. 60 pages. 50c.

Reserved for later notice.

Holman Hunt. By George C. Williamson, Litt.D. (Bell's Miniature Series of Painters.) The Macmillan Co., New York. 4×6¼ in. 64 pages. 50c.

Reserved for later notice.

Journal of Social Science, containing the Proceedings of the American Association. Number XL. December, 1902. Washington Papers of 1902. Papers Read in the Department of Education, Health, Jurisprudence, and Social Economy, with Stenographic Notes of Debate. Published for the American Social Science Association by G. P. Putnam's Sons, New York. 6×9½ in. 223 pages.

Laundry Manual. By L. Ray Balderston and M. C. Limerick. (Third Edition, Revised and Enlarged.) The Avil Printing Co., Philadelphia. 5×7¾ in. 66 pages.

Le Gendre de M. Poirier: Comédie en Quatre Actes. By Émile Augier et Jules Sandeau. Edited by Edwin Carl Roedder, Ph.D. The American Book Co., New York. 5×7 in. 144 pages. 40c.

Letters from the East, 1837-1857. Edited by Janet Ross. Illustrated. J. M. Dent & Co., London. 6×9 in. 332 pages. $5, net.

The author of these letters was an English diplomat, administrator, and sportsman in India and elsewhere, and his letters abound in interesting and quite often thrilling accounts of experiences and adventures in Asia Minor, Arabia, Syria, and Egypt. He knew the life of the people of the East intimately, and he saw and relates many really extraordinary incidents. Of another kind of interest is a passage on the very first page of the book. We quote it as adding another to the many curious glimpses of Disraeli's personality:

> When I was about twelve, Disraeli, accompanied by Mr. N. Willis, the American author, came from Alexandria to Malta with letters of credit to my father, and presented himself at the office dressed in a silk dressing-gown with a guitar suspended by a broad riband round his neck. My father asked him to dine and to go to the opera afterwards, and we boys were allowed to come down to dessert and to accompany the party to the

theater Disraeli wore lace ruffles on his shirt-front and his wrist-bands, and his fingers were covered with jeweled rings, so we looked much more at him than at the scene on the stage

Loyal Traitors: A Story of Friendship for the Filipinos. By Raymond L. Bridgman. The James H. West Co., Boston. 5×8 in. 310 pages.

Marianela. By B. P. Galdós. Edited by Edward Gray, A.B. The American Book Co., New York. [illegible] in. 264 pages. 90c.

Mediæval French Literature. By Gaston Paris. (The Temple Edition.) The Macmillan Co., New York. 4×6 in. 161 pages. 40c.

The careful study of the literature of Old France by M. Gaston Paris—regarded abroad as a standard work on the subject—has now been translated into English and published in a small but excellently printed volume. The erudite professor considers his subject both from its social aspect and its historical values. The work inexcusably lacks an index; when succeeding editions are thus provided, the book should become an extremely valuable volume for students both of French and of comparative literature. The author seems equally at home whether discussing the Merovingian, Carolingian, or Capetian periods, but perhaps his most brilliant description is that of the reign of Louis VIII., when a literary activity was evident more genuinely aristocratic in the best sense than any which preceded or succeeded it. In that notable age the Arthurian romance was written and poetry flourished, whether in epic, romantic, satirical, didactic, or lyric form. In later chapters two comments by the distinguished author should be noted: one is that Philippe de Comines is "justly regarded as the first of modern historians;" the other is that Villon is "the first and perhaps the best of our humorists."

Mediæval India under Mohammedan Rule, 712-1764. By Stanley Lane-Poole, M.A., Litt.D., M.R.I.A. Illustrated. G. P. Putnam's Sons, New York. 5¼×8 in. 449 pages. $1.35, net.

Professor Lane Poole here relates the story of the thousand years from the coming of the Arab to the coming of the Briton. It is more the story of princes than of a people; there is no national development, but a series of conquerors and rulers, among whom tower a few majestic names like Tennyson's Akbar. "One by one they tower and they are gone," and still the people vegetate as torpidly as ever, their destiny a riddle still to prophets. Their story abounds in tragedy, and the best thing that ever befell them is their subjection to British law. The present narrative is vividly told and copiously illustrated.

Modern Plea for Ancient Truths (A). By J. H. Garrison, A.M., LL.D. The Christian Publishing Co., St. Louis. 5×7½ in. 94 pages. 35c.

Naturalist in Indian Seas (A). By A. Alcock, M.B., LL.D., F.R.S. E. P. Dutton & Co., New York. 6×9 in. 328 pages. $6, net.

This tells the story of a four years' cruise with the British Royal Indian Marine Survey ship Investigator. While part of the volume is intended for the use only of students of marine zoölogy, there are also chapters which give in a popular and non-technical way accounts of the methods of deep-sea sounding, explorations of "the world beneath the waters," deep-sea life, personal adventures in far-away islands and strange coasts—all of which is readable, often entertaining, and sometimes even poetical. The book is handsomely printed and illustrated.

New Century Bible (The): Vol. II., St. Mark. Edited by S. D. F. Salmond, D.D., F.E.I.S. General Editor, Prof. W. F. Adeney. Oxford University Press (American Branch), New York. 4×6½ in. 377 pages.

It is some time since the last volume of this series appeared on our table. We therefore note that it contains both the Authorized and the Revised Version, and that the annotations on the latter make it a brief and handy sort of commentary for popular use.

Next Step in Evolution (The): The Present Step. By I. K. Funk, D.D., LL.D. Funk & Wagnalls Co., New York. 3¾×7 in. 106 pages. 50c., net.

There is much in this little book that reminds one of Henry Drummond—its emphasis upon the unity of the spiritual and the natural world, its imagery drawn from science and from common human experience, its vital rather than scholastic atmosphere. The author presents the coming of Christ into the life, the character, of humanity as the true second coming of Christ, whatever other coming there may be. Appeal is made equally to the reason and the imagination. The book is full of quotable passages: "In a deep sense, as a man thinketh so he is. . . . Answer to prayer is a growth, a building up or down to what you wish." "The children of the inner kingdom never crowd; the more, the more room." This book is a type of that new devotional literature which is the product of a scientific age.

Origin of the Knowledge of Right and Wrong (The). By Franz Brentano. English Translation by Cecil Hague. E. P. Dutton & Co., New York. 5½×8¾ in. 125 pages. $1.50, net.

The lecture thus entitled was originally delivered before the Vienna Law Society. Professor Brentano holds that there is a natural moral law universally and incontestably valid, and that the knowledge of it lies within the range of the human mind. The argument by which he supports this view is so discursive as to fail somewhat in distinctness, and may elude the grasp of many readers.

Our Lord and Master: A Brief Study of the Claims of Jesus Christ. By Rev. Jesse Bowman Young, D.D. Jennings & Pye, New York. 4½×6 in. 99 pages. 25c., net. (Postage, 4c.)

Prophetic Ideas and Ideals: A Series of Short Studies in the Prophetic Literature of the Hebrew People. By W. G. Jordan, B.A., D.D. The Fleming H. Revell Co., New York. 5×7½ in. 363 pages. $1.25, net.

Much has been done during the past twenty years for the recovery to modern appreciation and use of a formerly much neglected part of the Bible—the discourses of the Hebrew prophets. Much remains to be done, and for that purpose this is a thoughtful and helpful book, written out of full sympathy with the men whose ministry it portrays. More than any "message" of theirs, as Professor Jordan truly says, "is the spirit that they quicken in the devout student, and the atmosphere of fearless faith and courageous hopefulness that

they kindle about his life." To catch this spirit, to separate it from its temporary and local form, enables the modern preacher to emphasize with them the unity of life, to invest secular things with a sacred interest, to carry religion into business and politics as well as worship. The plan of this work, as carried out in a series of short sketches, is expository rather than critical. Without technical discussions, the prophetic ideas and ideals are exhibited in all their diversity of time, personal character, and local circumstance, as unified by a common spirit, which demands its due expression in modern no less than in ancient time.

Recent European History, 1789-1900. By George Emory Fellows, Ph.D., LL.D. Illustrated. Benjamin H. Sanborn & Co., Boston. 5½×7½ in. 459 pages.

Red Miriok (The). By Anna M. Barnes. Illustrated. Shan Folk Lore Stories. By W. C. Griggs, M.D. Illustrated. The American Baptist Publication Society, Philadelphia. 5×7½ in. 108 pages. 75c., net. (Postage, 8c.)

Representative Art of Our Time, with Original Etchings and Lithographs and Reproductions of Oil and Water-Colour Paintings, Pastels, etc. Edited by Charles Holme. Published by International Studio, 67 Fifth Avenue, New York. 11×15 in. 34 pages. Complete in 8 Parts, each $1, net.

It is interesting to Americans that "The Studio's" New Art Supplement should begin with an article on wood-engraving, which was the medium through which drawings were first presented to the readers of our books and magazines. Charles Hiatt gives a compact history of the development of this art, with particular attention to its modern aspects. He considers the *criblé* method of the fifteenth century; the work of Dürer and Holbein in the sixteenth century; the white-line method of Thomas Bewick in the eighteenth century, and the black-line method as used by Timothy Cole and others of the present school. He mentions especially Paul Colin, the Frenchman, who works like a painter and uses every possible effect to realize his ideal. Mr. Hiatt observes that wood-engraving has been almost entirely supplanted by other reproductive processes, but hopes that among art-lovers it will come to be esteemed for its own sake. The large illustrations, many of which were produced especially for this work, are admirable reproductions of an etching by Edgar Chanine, a monotype in colors by Alfred East, a pastel by E. Aman-Jean, a woodcut by W. O. J. Nieuwenkamp, a tinted chalk drawing by G. Dupuis, and a water-color by Josef Israëls. Each picture is mounted between two sheets of heavy paper, which is the plan most approved by collectors. This work will appear in eight parts, and if the high standard set by the first installment is maintained, the subscribers will have a valuable commentary on the graphic arts of our time, and a beautiful collection of the works of notable artists.

Room with the Little Door (The). By Roland Burnham Molineux. G. W. Dillingham Co., New York. 5×7½ in. 263 pages.

Rose and the Sheepskin (The). By Josephine C[illegible] William H. Young & Co., New 389 pages. $1.

Scientific Side-Lights. Compiled by James C. Fernald. Funk & Wagnalls Co., New York. 6½×10 in. 917 pages. $5, net.

One reason for the publication of this curious and interesting collection may have been to help out possibly lazy persons and lecturers. Its forty thousand indexed topics certainly make all matters contained in the volume very accessible; and should make the work of a public speaker rather easy so far as second-hand illustration is concerned. The best public speakers, however, have long discovered that the most effective illustration is first hand—that which comes exclusively from personal experience. Most of the material in this volume consists of excerpts from scientific books; the work impresses the casual reader as a kind of scientific causerie—as if the company of acknowledged authorities were talking familiarly among themselves, each one mentioning a few of the most interesting discoveries and extensions of knowledge in his own department of science. Such authorities are, for instance, Darwin, Haeckel, Huxley, Langley, Lyell, Pasteur, Tyndall, Wundt, Agassiz, Dana, Humboldt, Newcomb—to quote at random. Another feature is found in the fact that each extract is a direct quotation from the author named; the book is in no sense a digest or summary. Finally, a third feature lies in the opportunity offered to follow up a particular subject, as to each selection are appended not only the names of author, book, and publisher, but also of volume, chapter, and date of publication.

Soltaire: A Romance of the Willey Slide and the White Mountains. By George Franklin Willey. Illustrated. The New Hampshire Publishing Corporation, Manchester, N. H. 5×7½ in. 143 pages.

Studies in Zoölogy: An Introduction to the Study of Animals for Secondary Schools and Academies. Illustrated. The American Book Co., New York. 5×7½ in. 232 pages. 75c.

Ten Thousand Words Often Mispronounced. A Revised and Enlarged Edition of "7,000 Words Often Mispronounced," with a Supplement of 3,000 Additional Words. Including an Unusually Large Number of Proper Names and Words and Phrases from Foreign Languages. By William Henry P. Phyfe. (Fifty-ninth Thousand.) G. P. Putnam's Sons, New York. 4¼×6½ in. 660 pages. $1, net.

With this book the title tells the story. In many cases, where the dictionaries differ, several are quoted by name. The volume is extremely convenient and useful, and is now widely accepted as an excellent reference-book.

Westward Ho. By Charles Kingsley. Illustrated. (The Temple Classics.) The Macmillan Co., New York. 4×6 in. In 2 vols. 50c. each.

An acceptable addition to the admirable "Temple Classics." "Westward Ho" is truly a classic in that it has kept its vitality and flavor and virility as few books do.

Works of Jane Austen (The). Illustrated by Hugh Thomson. The Macmillan Co., New York. In 5 vols. 4½×7 in. 80c. per vol.

A remarkably good edition for the price; uniform in style with the editions of "Cranford" and "The Vicar of Wakefield." Mr. Thomson is the best conceivable illustrator for Miss Austen, and his drawings are charmingly imagined and executed.

Libby's

CORNED BEEF HASH

It is good, made after a receipt that leaves nothing to be desired. You can't add to or take from it, it is perfect as it is.

It's carefully prepared, made from the best selection of fancy Corned Beef.

Appetizing in appearance when taken from the can—appetizing when it comes on the table.

It's a breakfast in itself. It satisfies and you'll want it every morning.

There's much good information in our booklet "How To Make Good Things To Eat," sent free. It tells about all of

Libby's
(Natural Flavor)
Food Products

and how to make many dainty luncheons, suppers, breakfasts with them.

HOLDING UP A STATE

THE TRUE STORY OF ADDICKS AND DELAWARE

BY GEORGE KENNAN

A FIGHT FOR THE CITY

VI. ELECTION DAY—AND AFTER

BY ALFRED HODDER

WOULDN'T YOU BUY A $500 U. S. BOND FOR $10 DOWN

THEN BALANCE AT $6 PER MONTH?

Wouldn't you at least be anxious to learn all the facts of such an unusual offer?

And if the largest real estate firm in the world offered to sell you a $510 lot in Greater New York for $10 down and $6 a month—a lot that will likely be worth many times the value of a $500 Government bond within a few years—and the proposition was made by a firm just as reliable, just as substantial in financial circles as the United States Government is among the nations of the world—a firm that has over 70,000 customers, in New York, in every State in the Union, in practically every country on the globe; a firm that has been entrusted with millions upon millions of dollars of these customers for investment and homes—we say, wouldn't the offer of such a firm be well worth investigating? Wouldn't you be just as anxious to hear *their* story?

During the past two seasons our advertisements have appeared in the leading magazines and religious publications of the country. In them we told you as convincingly as we knew how, of the extraordinary real estate conditions existing in New York City—how these conditions were due to the tremendous annual increase in population (over 110,000 a year)—the restricted territory in which New York can possibly expand—and the limited amount of land to be had in this Empire City of the World.

Thousands have taken advantage of our offer. Hundreds have visited New York—*confirmed* every statement we have made—were *convinced*—and BOUGHT—many of them buying two to four times as much as they originally bought by mail.

In the past 4 years we have sold over seven million dollars' worth of New York property.

Doesn't it seem fair to presume that the same reasons which convinced so many thousands of practical, thinking men and women everywhere of the undoubted value of our proposition, would convince YOU? Isn't it worth the time at least to send us your name to-day—and learn how you may make thousands by paying $10 down and $6 a month—or $510 in all?

This may sound extravagant—yet every statement we make is based upon a fact—it is in evidence—it can be *verified*—it can be SEEN. Naturally we might be considered as biased in our opinions—of painting New York's future in too rosy colors—but what would you think—

IF RUSSELL SAGE TOLD YOU

That you could make a Fortune in New York Real Estate—

(especially if it were to cost you only $10 down and $6 a month) wouldn't you be impressed? Well, listen! Here's just what Mr. Sage did say in the New York World of September 28, 1902:

FREE TRIP TO NEW YORK

As a guarantee of good faith, we agree with all persons living East of Chicago to pay you in cash the cost of your railroad fare to New York and return, if you visit our property and find one word of this advertisement a misrepresentation; or in case you buy, we will credit cost of the fare on your purchase; to those living farther away we will pay a proportion equal to round-trip Chicago ticket $36.

"I do not think the future of New York can be depicted in terms any too glowing. The most fanciful writers can not exaggerate the greatness of its future.

"A man who buys real estate in any of the five boroughs—of course exercising average good judgment—has a fortune before him. Brooklyn is growing at the rate of 75,000 people a year.

"Young man, buy real estate in the outlying boroughs, and then work hard at your usual avocation. Your real estate purchases will make your old age comfortable."

RUSSELL SAGE.

Our properties are located in Brooklyn—it is therefore a very significant fact when Mr. Sage says, "*Brooklyn is growing at the rate of 75,000 people a year.*" Think of it! That means *three-fourths* of all New York's enormous yearly increase of population.

REFERENCES: 20 National Banks, the Commercial Agencies, prominent magazines and religious periodicals, and the written testimony of thousands of satisfied customers whose addresses will be furnished upon application.

Remember, if you should die at any time before payments have been completed, we will give to your heirs a deed of the lot without further cost. If you should lose employment or be sick, you will not forfeit the land.

Remember also that your purchase is made **with the distinct understanding that we will refund all money paid us, with 6% interest added,** if, after visiting New York within one year, it is found that we have misrepresented our proposition in the **slightest particular.** You will therefore run no risk whatever in sending us $10 first payment, immediately, to secure earliest selection and share from the start in the increase in values. **But write under all circumstances.** You would not be fair to yourself if you failed to look into this matter at least. Fill out subjoined coupon and mail it to us to-day. That costs two cents and a minute's time. *Isn't it worth while?*

The New Publicity Law

Last week, without debate in the Senate and with but a short debate in the House, both branches of Congress accepted the Nelson publicity amendment to the Department of Commerce Bill, and the House of Representatives, with but an hour's debate, accepted the Elkins Anti-Rebate Bill, which had previously passed the Senate, and both measures were enacted into law. Unless the Senate accepts the Littlefield bill, which passed the House unanimously week before last, the anti-trust legislation of the session is completed. Senators Hoar and McComas, of the Senate Judiciary Committee, have been standing with the Democrats in favor of reporting the Littlefield bill to the Senate, but the other Republican members of the Committee have thus far successfully opposed this action. The impression is almost universal in Congress that the Littlefield bill is a more radical anti-trust measure than the Senate can be forced to accept—at least at this session. Of the three bills which have been adopted by Congress in carrying out Attorney-General Knox's anti-trust programme—the bill expediting trust cases before the courts, and the bills passed last week to secure publicity and prevent rebates—the publicity amendment is the only one which is reported to have aroused serious antagonism on the part of the trusts, and its provisions have naturally awakened the greatest popular interest. It creates within the Department of Commerce a Bureau of Corporations whose Commissioner shall have power, under the direction of the Secretary, to make "diligent investigation" into the management of corporations engaged in inter-State or foreign commerce, except railroads, and to report to the President the information so secured, and make public such parts thereof as the President may direct. In the House Mr. Littlefield and nine Democrats refused to vote for this provision, on the ground that the publicity provided was too limited to prove effective. They particularly objected to the fact that no exposure of trust excesses could take place except through the co-operation of three officials, some one of whom might prove lukewarm in the publication of things which the trusts desired to keep secret.

The New Anti-Rebate Law

The Elkins Act forbids railroads to grant freight rates below published schedules, and makes the corporations themselves punishable for offenses against its provisions. Heretofore, under the court decisions, it has been necessary to prove, not only that published rates had been departed from, but also that a greater rebate had been granted to one shipper than another, and only the agent granting the discriminating rebate was punishable. By the Elkins bill the offending railroad agent is exempted from the criminal prosecution to which the amended Inter-State Commerce Law has rendered him liable, in the expectation that this exemption will make successful prosecutions less difficult. When the bill came before the House the Democrats wished to substitute for the Elkins bill the Littlefield bill, which it had passed the week before, and thus force the more aggressive measure upon the Senate for consideration. The Republicans blocked this procedure by adopting a rule forbidding amendments to be offered. Mr. Littlefield was unable to secure from the Republicans the opportunity to criticise the Elkins bill, and when given a moment out of the time accorded to the Democratic leader he pointed out that only two felony offenses could be punished under the terms of the Act. Six Democrats voted against the

Elkins bill, and Mr. Littlefield refrained from voting. The chief points as to which the Littlefield bill is more radical than the measures just enacted into law are that it stipulates the subjects upon which corporations engaged in inter-State commerce must submit returns, and that it denies to manufacturing corporations the right to use the facilities of inter-State commerce if they received rebates or discriminated in prices in any locality in order to crush competition. This last provision forms the one part of Attorney-General Knox's anti-trust programme which has not in some form been enacted into law.

❀

What More Can Be Done

Under the Constitution, as interpreted by the Supreme Court of the United States, Congress, under the clause giving it control of inter-State commerce, has only limited powers over corporations not specifically engaged in the carrying trade. Whether it can *indirectly* supervise manufacturing corporations is a question on which the Supreme Court has rendered no authoritative decision. Mr. Littlefield and Attorney-General Knox think it can. Congress has heretofore provided that railroads shall be subject to supervision by the Inter-State Commerce Commission, and it now provides that all other corporations engaged in inter-State commerce shall be subject to supervision by the newly created Bureau of Corporations, but it has provided no regulations for other corporations. If this legislation proves inadequate to prevent monopolistic control over necessary articles of public comfort and convenience—and we very seriously doubt its adequacy—the people will demand further legislation along more radical lines. Three such lines are possible. One is that of the Littlefield bill, carrying out the suggestion of Attorney-General Knox, prohibiting the instruments of inter-State commerce from carrying articles in the manufacture or sale of which a monopoly is attempted by unfair endeavors to destroy competition. The second is the plan suggested by Professor Jenks in The Outlook—the levying of a small tax on the net profits of all manufacturing corporations, the levy of which would give the Federal Government a right to examine their books, and if necessary their officials under oath, for the purpose of ascertaining what those profits are, and thus would involve a *quasi* publicity of their affairs. The third plan is a Federal tax on all manufacturing corporations acting under a State charter, the effect of which would be, as was proved by the history of banking in this country, to drive the larger corporations to seek a Federal charter, and thus to bring them directly under Federal supervision. All that can be said respecting the legislation enacted at this Congress is that Congress has, with substantial unanimity, recognized the necessity for some anti-trust action by the Federal Government, and so opened the way to more effective action if the development of events shall prove it necessary. The Outlook thinks it is very clear that such action is Constitutional and possible, in one or all of the above ways, if it shall prove to be desirable.

❀

The Aldrich Currency Expansion Plan

The prospects of the Fowler bill to expand the currency by unsecured bank notes become steadily fainter, but Senator Aldrich, of Rhode Island, last week introduced a more conservative bill to accomplish the same end, which may be adopted before the session ends. It proposes to allow Government funds to be deposited with banks on the security of State, city, and railroad bonds, thus releasing the Government bonds now used for this purpose and permitting them to be used as the basis for further bank-note circulation. The bill also proposes to permit the bonds issued for the construction of the Panama Canal to be used as a basis for bank-note circulation. The latter bonds are of course to be issued upon the faith of our National Government, like other Government bonds now outstanding, and therefore may as safely be used as a basis for bank-note circulation. In order to prevent unsafe railroad bonds from being accepted as security for Government deposits, the Aldrich bill stipulates that they must be the first-mortgage bonds of roads which have paid at least four per cent. dividends regularly for a decade. The best feature of the bill—and the one counted upon to prevent Democratic opposition—is that it

stipulates that the Secretary of the Treasury shall require at least one and a half per cent. interest on the public funds hereafter deposited with the banks. This provision will not only yield a revenue to the Government and lessen the danger of corrupting relationship between the depository banks and the Government, but also will permit a slight element of elasticity in the currency, since the Secretary of the Treasury may fix the rate of interest for Government deposits high enough to keep the banks from demanding all the available treasury surplus save in times of crisis.

❀

The Alaskan Treaty Ratified

International good feeling and courtesy carried the day in the Senate last week, and the Alaskan boundary treaty was ratified with but few protests against it, and none of the predicted filibustering. The treaty provides that the questions in dispute shall be submitted to a Commission of six jurists—three to be appointed by this country and three by Great Britain. There is no provision for an umpire acceptable to both sides, as in an ordinary board of arbitration, but a decision unfair to either side is even more surely avoided by the provision that no award is binding unless agreed to by four of the six judges. There is every reason to believe that an agreement can be speedily reached despite this provision, for while the controversy is quite heated in the sections immediately affected—the northwestern part of the United States and Canada—hardly more than one of the Commissioners appointed by either of the two great nations is likely to be selected from the heated sections. The other Commissioners, both of Great Britain and of our own country, will approach this subject in a genuinely impartial spirit and with a strong desire to reach a fair solution. The objection urged in some parts of this country, that we could not consent to any form of arbitration because we were so entirely in the right, was almost as unreasonable as it was discourteous toward our Northern neighbors. There are, indeed, some questions which nations should not arbitrate, but they are questions of principle rather than questions of material interests. Questions of the latter sort, presented in good faith by an honorable neighbor, should always be submitted to impartial arbitration, and the surer we are that we are in the right, the less reason have we to object to a fair hearing of both sides and a decision free from prejudice.

❀

The Standard Oil Telegrams

It is not generally the habit of Senator Quay in his game of politics to let the people know what he is really after. It is therefore probably safe to assume that in using the Statehood Bill to block the way to other legislation, his interest was only secondarily in that bill, primarily in something else; and the surmise is not unreasonable—though it is only surmise—that this something else was the anti-trust legislation, to which we may be perfectly sure such a servant of corporate interests as Mr. Quay would be unalterably opposed. They whose works are evil love darkness better than light, and the opposition to publicity comes chiefly, not from those corporations whose operations are such that they have no ground to object to the public knowing about them, but from those who depend on political partnerships and legislative favors, of which, from their point of view, the less said the better. The successful prohibition of legislative activity in the Senate has prevented the Senatorial consideration of the Littlefield Anti-Trust Bill, unanimously passed by the House, and might have prevented any anti-trust legislation at this session of Congress had it not been for the generally credited newspaper reports that representatives of the Standard Oil Company had telegraphed to United States Senators protests against any anti-trust legislation. Whether such telegrams were sent we do not know; the report appears, however, to be well authenticated; the Standard Oil Company officials refuse either to admit or deny the report, and the Senatorial denials have been ambiguous and inconclusive. That any of these telegrams, if such were sent, were signed by Mr. Rockefeller's name we think is highly improbable; for Mr. Rockefeller is not without experience in legislative matters, and must have known that, if the telegram or its substance were made public, the fact would injure his cause more than the message could aid it. But Mr. Rockefeller

has a perfect right to telegraph a Senator his opinion concerning any legislation before Congress. There is no reason why any constituent should not write or telegraph to his Senator or Representative urging particular action on a pending bill, provided his message is the expression of his judgment respecting the relation of the bill to public interests, and is accompanied by a statement of reasons for or against the bill. There is very good reason why a constituent should not write or telegraph what can be construed into an order to his Senator or Representative, or what is simply a personal request for specific action, not on public grounds, but as a matter of personal favor. It is so generally believed that the Standard Oil Company has not scrupled to use legislative influence for its own ends that the public is naturally ready to accept the report that it has done so in the present case. If the report was erroneous, it would have been wise for the officers of the Standard Oil Company to have given it an explicit denial.

❀

The Settlement of the Venezuelan Question

All nations and parties concerned are to be congratulated upon the amicable arrangement finally reached. The protocols have been signed, the blockade has been raised, and commissions (not arbitration boards) will be appointed to consider and compute the various claims. The preliminary immediate cash payments have been fixed at $27,500 to each of the three allies—Great Britain, Germany, and Italy—while Germany will also receive the sum of $320,000 in five monthly payments. As we understand it, these payments are to cover claims already recognized by the Venezuelan Government, not in dispute, and already computed. The yielding to Germany's special demand in this direction was probably good policy on the part of Venezuela, and necessary to the reaching of a conclusion; the comment has been widely made that Germany's rigor in applying force at the outset and in demanding a larger money payment than the other allies will probably in the end result in a loss of trade to Germany in Venezuela largely exceeding the amount Germany now receives, owing to the exasperation of native sentiment in Venezuelan ports of commerce. It is to be recorded, however, that all the allies materially reduced their demands for cash from their first figures. Mr. Bowen has shown great energy and resource in presenting Venezuela's position and advocating her claims. The commissions to consider the claims are to consist in each case of one representative of Venezuela and one of the country making the claim, and in case of a failure to agree President Roosevelt is asked to appoint an "umpire" or referee. It does not seem that such action on his part is at all open to the objections brought with considerable force against his acting as sole arbitrator between Venezuela and the allies; the mixed commissions now proposed will not, to any great extent, discuss principles of international law, but will examine and audit the claims. It is worth while to note that the European papers are commenting on the result of the negotiations as a great political success for the United States and the Monroe Doctrine—a result not always pleasantly received by them. Thus, the "Allgemeine Zeitung," of Vienna, says: "Europe was united on only one point—namely, her desire not to arouse the antipathy of Americans."

❀

No Hostility to the United States Involved

Although what will be known as the Venezuelan affair has not been unattended by friction and at times by some anxiety, it has been a conspicuous illustration of the fact that nations can deal together in very critical situations with very delicate matters as rational individuals can deal together in the settlement of their differences. In this case there has been at all times, apparently, a complete understanding between our Government and the Governments of England and Germany. Before the demonstration was made the two foreign Governments had explained in detail what they proposed to do. There never was the slightest apprehension in any responsible quarter that Germany had any other intention in Venezuela than that which she had fully disclosed to our Government. Some irritation was caused by the feeling that German methods were unnecessarily severe; and that, in view of the endeavor to settle the differences on a peaceful basis, the action

of the German commanders was calculated to introduce new elements of confusion into the situation. There was good ground for that irritation; but there was never any doubt of the sincerity of the German Government in its full disclosure of its purposes. Nor has there been any expression which could be taken as significant of a general unfriendly feeling towards Germany. The momentary irritation over German methods did not arise from any feeling of animosity towards Germany. From the beginning the purpose of the English Government has been unmistakable. It has never for a moment intended to do anything which should be in the nature of a surprise to our Government, or which could by any possibility be considered as lacking in friendliness to the Nation. If the English Ministry made a mistake in co-operating with Germany in this transaction, it has taken very good care to make it perfectly understood that under no circumstances was it taking a hostile attitude to this country. Despite the momentary irritation incidental to almost all such transactions, the settlement of the Venezuela affair is a chapter in the new relations of nation to nation of the greatest and most beneficent significance.

❀

Macedonia Last week the Redifs, or Turkish army militia, were ordered to join the colors. According to official statements, these troops are intended to replace the battalions called out to quell the Macedonian outbreak last autumn. It is significant, however, that no orders have been promulgated to withdraw any troops in Macedonia. The concentration of Turkish soldiery there, particularly on the Bulgarian frontier, is the reason for the rumored mobilization of the Bulgarian army and for warnings by Austria and Russia to all reserves to be in readiness. There is adequate cause for all legitimate endeavor to free Macedonia from the rule of the Turk, if for no other reason than that of crushing taxation; in some cases the tithes amount to more than the whole value of the crops, which have been burned by the unhappy people. This and other oppressions are in glaring contrast to the comparative freedom and opportunity enjoyed by the Bulgarians across the border. If the ambition to free an enslaved people is a good one, the methods used by the Bulgarians have been infamous. The patriot-brigands who make up the Bulgarian Macedonian Committee, after years of blackmail, intimidation, kidnapping, and murder, have attacked Turkish troops in order to provoke atrocities which should arouse Europe. It is evident that Abdul Hamid does not propose to be despoiled of his province without the stern protest which his million soldiers can make against the combined forces of Bulgaria and Servia, reinforced by what Russia and Austria can spare. If a war should come, it will probably provoke less sympathy than at any time since the last Balkan conflict (1877). It is true that the Sultan has further blackened his record by the Armenian atrocities, and that he should have long since been expelled from Europe; but it is also true that the would-be liberators of Macedonia were the abductors of Miss Stone, the American missionary, and that the great Power which plays an increasingly preponderant role in the Balkans is the one which, repudiating the promises of a century, reduces its province of Finland to vassalage.

❀

The Mine Workers' Final Plea Public interest in the coal strike hearings, which had sensibly waned during the preceding fortnight, rose to its highest level last week, when the attorneys for the two sides summed up their respective cases. On the side of the miners the addresses of Mr. Henry D. Lloyd and Mr. Clarence Darrow were both remarkable for brilliancy of style—Mr. Darrow's speech sometimes losing in convincing force by reason of the excess of keen satire. The review of the history of the strike and the argument for higher wages and shorter hours need not be summarized. Suffice it to say that the miners' attorneys contended that the wage statements presented by most of the companies had been proven worthless; that the wages paid by the Reading Company, after deducting the cost of miners' supplies (oil, smithing, etc.), averaged only $333 in 1901; that over five in every thousand of the miners are killed every year; and that the violence of the miners during the strike had been grossly exaggerated by the mine-owners' representa-

tives—only two deaths, instead of twenty-one as charged before the President, having resulted from a six months' strike of 147,000 workers. The legal use of the boycott was justified as a strike weapon—Mr. Lloyd contending that the union could not protect strike-breakers from the obloquy which from the time of our own Revolution had fallen upon those willing to paralyze the struggles of their fellows for the elevation of their class. It was not against non-unionists, he claimed, that these boycotts were directed, but only against strike-breakers. The mine workers of America, he claimed, had never gone on strike against the employment of non-union men. A labor monopoly, he suggested, could be avoided by an award stipulating that non-union men should continue to be employed alongside of union men. All this served to introduce the cardinal demand of the union's attorneys—a trade agreement between employers and employed to cover the anthracite regions, as a similar agreement already covers the greater part of the bituminous field. Mr. Lloyd referred to the agreement just reached in the bituminous field, and declared that for six years these agreements had secured industrial peace and better conditions for employers as well as employed. "The testimony of the employers," he declared, "is practically unanimous that strikes have been stopped, discipline has been restored among the men, and equality of competition given to the masters. The unions have been faithful in keeping their contracts, and moderate in their demands. A better class of leaders is pushing to the front. . . . The strikes [in the anthracite field] since 1900 we claim as part of our case for the recognition of the union. The anthracite miners are willing to be disciplined by a power which exists by the joint agreement of the operators and themselves. They are not willing to be disciplined by the operators alone."

❀

President Baer's Final Offer

The case for the operators was presented with equal effectiveness by President Baer, of the Reading. Here again we cannot summarize the general argument based upon the history of the strike, the responsibility of the union for violence, the liberality of present wages, and the necessity of preserving the principle that the companies "have a right to employ any honest man, without discrimination as to religion, nationality, or membership in a labor organization." Upon these points it is sufficient to note that President Baer referred to resolution number 35 of the Anthracite Miners' Convention at Shamokin approving the action of a district organization which authorized its members to strike against the employment of non-union men, and that he urged that the excessive supply of immigrant labor about the mines was the result of the abnormally high wages already accorded, and that the excess would be increased if wages were again advanced. The reduction of the hours of labor he declared to be inadvisable, because it would reduce the output of coal. These points, however, were of less present interest than the suggestions President Baer made regarding the basis upon which the strike might be settled. The most important of these suggestions was contained in the following paragraph:

> If Mr. Mitchell simply represented our own employees, and was acting exclusively for them, there could be no objection to dealing with him; but he represents an organization having for its object some utopian scheme of uniformity in wages and conditions in the mining of coal all over the United States.

This statement, taken in connection with that of Mr. Lloyd regarding the working together of union and non-union men, offers a basis of compromise upon which trade conferences and agreements between employers and employed may be secured. It would not be necessary that the united anthracite operators deal with the United Mine Workers of America. It would be enough if they dealt with the mine workers in their employ. The union surely has no basis for complaint if all mine workers are represented by the delegates of their choice. The other proposal of President Baer related to wages and was briefly as follows:

> (1) Present wages to form the minimum for the next three years; (2) all mine workers except contract miners to get a five per cent. advance on work done during the present winter; (3) after April 1, wages to be advanced one per cent. for every five cents by which the price of coal in New York Harbor exceeds $4.50 a ton.

This offer, in so far as it proposes a sliding scale, by which wages shall vary with

prices above the fixed minimum, is eminently fair. But it is not so fair in proposing that wages shall advance only one per cent. when the price of coal advances five cents a ton. According to the census of 1890, the wages paid in the anthracite coal mines average a little less than a dollar a ton. An advance of one per cent. therefore means an advance of one cent a ton. If, therefore, wages advance but one per cent. when prices advance five cents a ton, the workmen would apparently get but one cent of the advance and the railroad and mining companies would get four cents. The miners' attorneys have declined the proposal, and the Commission has been left with the duty of formulating a schedule just to both parties.

❀

Prohibition and Law Enforcement in Maine

The action of Chief Justice Wiswell at Belfast, Maine, and of Presiding Justice Speer, in Bangor, Maine, last week, has produced instantly a change in the conditions of that portion of the State, and is, we hope, premonitory of a change which will be more widely felt. Under the prohibitory liquor law of the State, the court may punish any violation of that law by a fine not exceeding one thousand dollars or imprisonment not exceeding one year, or by fine and imprisonment. Under this prohibition it has been customary in parts of Maine for the court to impose a fine of one or two hundred dollars. The fine has been paid. It has served practically as a kind of license fee, paid after the year's business instead of preliminary thereto, and the business has gone on as usual. This has been popularly known as the "Bangor Plan," not because it has been confined to Bangor, but because Bangor has been the largest city in which its operation has been seen. Last week fines of eight hundred dollars and costs for wholesale dealers, instead of two hundred dollars as heretofore, and two hundred dollars and costs for retail dealers, instead of one hundred dollars and costs as before, were imposed. In addition, Chief Justice Wiswell announced that after March 1 fines would no longer be accepted as settlement of liquor cases in that court, and it is generally understood, though on what ground we do not know, that Judge Speer expects to give a similar warning and put it into effect at the next criminal term in August of this year. It is interesting to conjecture what the practical effect will be of insisting thus upon the jail sentence. Of course indictments and convictions would be more difficult to secure, as liquor-dealers would no longer plead guilty and pay the fine, and it is not possible to foretell whether juries would convict in contested cases, whatever the evidence. But the action of the court in these cases, if it should be premonitory of similar action through the State, would do much to put an end to that false pretense which has been the curse of Maine under the prohibitory liquor law. The people of the State would, at all events, no longer satisfy their conscience by keeping a law of prohibition in the Constitution and carrying into effect a low-license law in actual administration. We have no doubt that such judicial action, if it becomes universal, will give impulse in other parts of the State, as it already has in Bangor, to the growing demand for a change from statutory prohibition to high license and local option, the change which has already been accomplished in the State of Vermont. The need for such change has long been felt by many of the best citizens in Maine. It has long been quietly recognized by a large proportion, if not a majority, of the clergy. We observe that since this action of the court two Congregational ministers in Bangor have preached sermons in favor of the substitution of local option for prohibition, neither knowing that the other had any idea of so doing. The Rev. Charles H. Cutler in his sermon puts the matter concretely by illustrating the conditions of the city of Brockton, Mass., with a population of 40,000, which after eleven years of high license had 435 arrests for drunkenness in one year, and Bangor, with a population of 25,000, which had 1,044 arrests for drunkenness after twenty years of constitutional prohibition.

❀

The Convention for Religious and Moral Education

If the convictions of a great many men of varying standards of good judgment are not wholly wrong, the Convention for Religious and Moral Education, held in Chicago last week, is to be accounted an altogether unique occasion

and a force to be reckoned with in the future. In the number and representative character of its attendance it surprised not only all who responded to the call for it, but quite as much those who worked so long and hard to assure its success. Not less than three thousand people faced its chairman as he opened the first session in the great auditorium, and each of its five succeeding business sessions averaged an attendance of fully a thousand. But the most significant fact in this connection was the disproportionately large number of men present throughout. For it is surely a most exceptional feature in any general religious gathering to find men composing from seventy-five to eighty per cent. of the attendance, morning, afternoon, and evening, for two days. This is the more notable in view of the vast preponderance of women teachers in the schools of both State and Church. The only blunder was made here in nominating but one woman among the sixty or more officers finally chosen. The formal enrollment included over four hundred signatures, with addresses ranging over twenty-three States and five foreign countries, representing twelve denominations, as well as public schools and ecclesiastical agencies, young people's societies, and interdenominational movements, some liberals and many more evangelical conservatives, the greatest State universities of the West and the oldest universities of the East, church colleges and scientific technological schools, pastors, professors, editors, Sunday and public school teachers, fathers and mothers. Representatives of the Roman Catholic priesthood and laity and of Jewish schools and synagogues were in the audience, but unfortunately not on the programme. The spiritual tone and devotional spirit were as marked in platform utterance as in the earnest prayer and fervent song which opened and closed each session. This religious atmosphere, together with the profoundly serious earnestness and fearlessly free fellowship which pervaded the whole occasion, made it impossible to suspect the presence or possibility of any factional control, ulterior motive, or polemic purpose. Every man when on his feet was his own man and no one else's. In volunteering to discuss a topic, one man ventured to remark that he perhaps should not say what was deepest in his heart, when he was immediately interrupted by good-natured appeals to "let it out"—which he did with dignity and discretion.

❀

The Subjects Discussed

A truly sanctified common sense seemed to protect the Convention from having issues precipitately forced upon it which it could not settle, and the discussion of which would have been not only divisive, but futile. For instance, the question of what to do with the results of the higher criticism in popular teaching was neither forced to discussion nor timidly evaded. Some frankly asserted what they thought such results to be, but demanded nothing more than the right of way for the historical method of study. Others denied their relevancy to the spiritual content to be emphasized. So also the balance between new and better methods of teaching and the old reliance upon the pre-eminent spiritual value of the teacher's personal influence was firmly and sanely maintained throughout, as something to be gradually adjusted and developed, to the advantage of each term of the equation. In the background of all that was thought and said there loomed the overshadowing fact that, of the twenty-three millions of our population between five and eighteen years of age, fourteen millions are not known to have the advantage of any specific religious instruction except that received at home. Of course this merely states the problem to work for the practical solution of which the Convention was called. Toward that complex solution it has already at least contributed the factor of reciprocal respect and appreciation between representatives of the public-school system and those of church educational agencies and ideals to a higher degree than ever before. With this problem ever in view, if not preponderant, the discussions of the more theoretical religious, ethical, and pedagogical principles involved were necessarily broader and more fundamental, if not more vital.

❀

The Resulting Organization

The form given the permanent organization and the definition of its relationship to other agencies and interests closely involved in its progress was the final test of

the value and efficiency of the Convention. The constitution of the National Educational Association was adopted bodily, with only such changes as adapt it to the specific purposes of "The Religious Educational Association." The admirable balance of this well-adjusted and thoroughly representative form of organization, it was thought by all, would prevent any possibility of the use or abuse of the new association by any faction, section of country, school of thought, sectarian influence, or even by direction in the exclusive interest of any single phase of its own work. It will undertake "to render service in unifying the efforts of the different agencies already engaged in various lines of work; in correlating the forces already established, to the end that these agencies may accomplish even larger results," the acceptance of such service being, of course, wholly voluntary and in no case involving the giving up of independence. By resolution it was declared not to be the purpose "to publish a series of Sunday-school lessons or to compete with existing Sunday-school or other organizations, but rather to advance religious and moral education through such agencies." The type of relationship between the new association and any of the other agencies for similar work was fixed as wholly co-operative by the action of the "Council of Seventy," which called the Convention on behalf of the Institute of Sacred Literature. Before it convened, this Council of Seventy formally resolved to have no other relation to the new organization than might subsist between it and any co-operating body. Independence of any and all publishing interests was emphatically stated to be the settled policy of the Association. Conspicuous among the speakers and officers of the Convention were several prominent members of the International Sunday-School Association. The difference between the ideals, functions, and methods of the two organizations was most distinctly drawn and fraternally discussed by representatives of both. The election of Dean Frank K. Sanders, of Yale Divinity School, as President of the Association, and Nicholas Murray Butler, of Columbia University, as Vice-President, together with the choice of widely differing but very representative men to the other offices and the Council, guarantees the catholicity and effectiveness of this timely and forceful movement in American life and education.

The Death of Dr. Curry

The country loses one of its most distinguished men—educator, diplomatist, statesman, and soldier—by the death of the Rev. Dr. J. L. M. Curry, at Asheville, N. C., last week. Born in Georgia in 1822, Dr. Curry was graduated from the University of that State in 1843, and from the Harvard Law School in 1845. He began the practice of law in Alabama, entered the Legislature of that State in 1847, was twice re-elected, and at the expiration of his third term was sent to Congress. He was a member of the House of Representatives when Alabama seceded in 1861, resigned his seat, was elected to the first Confederate Congress, and continued a member of that body until the close of the Civil War. He served as aide on the staffs of Generals J. E. Johnston and Joe Wheeler, and was Lieutenant-Colonel of a regiment of Alabama cavalry. At the close of the war he was elected President of Howard College, a Baptist institution in Alabama. In 1868 he was appointed to the professorship of English Language and Philosophy and lectured on International and Constitutional Law in Richmond College. In 1881, on the death of Dr. Barnas Sears, Dr. Curry was appointed General Agent of the Peabody Fund for Southern Education, and later became identified with the Slater Educational Fund. When the Southern Education Board was organized, he became one of its most enthusiastic and useful members, full of zeal, tireless in suggestion and in action; for the chief interest of his later life was the promotion of public-school education in the South, for all classes, without distinction of race or locality. Dr. Curry was sent as Minister to Spain by President Cleveland in 1885, and in 1902 as special representative of the United States at the coronation of King Alfonso. Dr. Curry was a prolific writer, the author of a number of books of a religious, biographic, and political character, and contributed to magazines and reviews. He was a man of high character, of great force, and of statesmanlike breadth of view. His knowledge of educational

conditions in the South was intimate, his sympathy with educational movements profound.

❀

Woman Suffrage in New Hampshire

The men of New Hampshire are to vote on March 10 on the question whether the suffrage shall be extended in that State to the women. The proposal on which they are to vote reads as follows:

7. Do you approve of striking out the word "male" before the word "inhabitant" in the clause which provides that every male inhabitant twenty-one years of age (with certain exceptions) shall have a right to vote; which clause is supplemented by the provision that every such person shall be considered an inhabitant for the purpose of electing and being elected to office, as proposed in the amendment to the Constitution?

If adopted, this change in the Constitution would, without further action, confer the full suffrage upon the women of New Hampshire, on the same terms as upon men. Under the terms of the Constitution, a two-thirds vote of those voting on the amendment is required for its adoption. We advise our readers in New Hampshire to vote against this amendment, for three reasons: (1) An election in Massachusetts in which the question was submitted to the women demonstrated that less than four per cent. of the women of that State desire the suffrage. There is no reason to believe that the proportion of women in New Hampshire who desire it is any greater. The men ought not to impose political tasks on women who are unwilling to assume them. (2) The instincts of women are in this matter, as in most matters, wiser than the arguments of political theorists. Political functions are important, but there are other functions even more important; and women are right in thinking that they can serve the community better by leaving political responsibilities to men and devoting themselves to other and even more important services to humanity. (3) The suffrage is already sufficiently extended in this country, perhaps too much so. Political reform lies rather in the restriction of suffrage, not in the further extension of it. The second and third propositions may be debatable, but not the first. When the very small minority of women who want to vote have persuaded the great majority of women that they ought to want to vote, it will be time enough for their brothers to so change the Constitution as to impose on them the duty of voting. They ought not to do so before.

❀

The French Constitution

The proposal to revise the French Constitution is of interest to Americans, since the chief changes to be made will approximate the French system closely to our own. The framers of the American Constitution builded better than they knew. Their wisdom is emphasized with each year of our own history; the new Australian Constitution has been patterned upon it with striking literalness, and now the Republic of France, dissatisfied with its own model, proposes to adopt two vital features from ours. The first concerns the judiciary. Up to the present the French courts have not been independent enough of Parliament; in future it is proposed to make the highest tribunal, the Court of Cassation, independent, indeed to endue it with authority to pass upon the constitutionality of all acts of Parliament, and, in its discretion, to declare any of them null and void. Thus the Court of Cassation will become the counterpart of our Supreme Court. The second great change concerns the executive. Hitherto the French President has been chosen by Parliament, and his Cabinet has been composed of members of Parliament. It is now proposed that the President shall be chosen by the nation, and that he and his Cabinet shall not necessarily be members of Parliament.

❀

Addicksism

In this issue of The Outlook appears Mr. George Kennan's last article respecting Mr. Addicks and his political methods. These revelations are of more than local importance. Following the disclosures of political corruption in New York City, Minneapolis, and St. Louis, they indicate the end to which forms of corruption less palpably odious and too frequently condoned inevitably conduct; they furnish a startling object-lesson of the greatest peril which threatens the American Republic; and they incidentally explain to Northern readers the danger which South-

emers fear from universal negro suffrage and go far to justify those fears. We have done what we could by these articles to aid the small and heroic band who in Delaware are fighting a National battle against wholesale, flagrant, and scarcely concealed corruption. It is in vain for the politician or the editor to shrug his shoulders and say, It is incredible that a whole community should be bought. The answer is, The incredible is true.

If the men who are voting to dishonor their State by sending Mr. Addicks to the United States Senate doubt Mr. Kennan's revelations, they have only to vote for an investigation, and constitute a committee, on which the honest opponents of Mr. Addicks have a fair representation, and they can easily get the evidence to substantiate all that Mr. Kennan has told our readers, and more. But they will not do this; they have no need to do this; Mr. Kennan has told but little that is new to them. They know, or some of them do, that he has not told the worst, that there are facts in this Addicks campaign which cannot be told in a newspaper.

The narrative of Mr. Kennan cannot be cavalierly dismissed as mere "newspaper reports," "rumors of the street," "stories in the air." It is definite, precise, specific, and with a responsible historian to vouch for it. We confess that we wonder how, in the face of this narrative, men who call themselves gentlemen can go on voting to send this man to misrepresent the State of Delaware at the capitol of the Nation. We wonder how any United States Senator can allow the Nation to believe that he looks with acquiescence upon this endeavor to send such a man to be his associate in the public service. We wonder how any Senator can vote to confirm as United States District Attorney for the State the man who represents Mr. Addicks, who resigned his District Attorneyship to do Mr. Addicks's bidding and serve his purpose, and whose first official duty it would be, if he were confirmed, to prosecute for bribery the man whose associate if not whose servitor he is. We wonder that any Republican Senator can imagine that he is loyal to the party in giving countenance to a man who has first corrupted that party in his State and then threatened to bury it ten thousand fathoms deep if his corrupt plans miscarried, and, finally, has so far fulfilled his threat as to defeat the party in a Congressional election because its regular nominee was incorruptible. These, let the reader note, are not rumors or reports; they are facts which a careful investigation has substantiated. They are not even denied. It would be far better, not merely for the State of Delaware, not merely for the United States Senate and the Nation, but better also for the Republican party, that Delaware should send to the Senate two Democrats than that it should send any man who wears the livery and will do the bidding of Mr. Addicks.

The Sources of Tammany's Power

Mr. Hodder's account of "A Fight for the City," which is completed in this week's issue of The Outlook, is not a history of a campaign. It is not even the record of the movement of an army; it is a report of a series of skirmishes by a single company. Mr. Hodder's purpose was to focus the searchlight at a single point, as it had been Mr. Jerome's purpose to deal directly and practically with one phase of the situation. It is unnecessary to say that Mr. Hodder has not attempted to depict Mr. Jerome in heroic guise. The man represented a principle and a method. He saw more clearly than any one else the fundamental issue, and the story centers about him because, in the most concrete and dramatic fashion, he set that issue in the plainest kind of language, with the most definite illustration, and since his election has persistently and courageously acted in line with his declarations during the campaign.

What Mr. Hodder has endeavored to do was to show, with ample quotations from Mr. Jerome's speeches, the real character of the organization which has so often controlled the city of New York, and which the citizens of New York will be compelled to face, again and again, in the future. The genius of Tammany Hall is not, and never has been, understood by the great majority of voters. They have regarded it as a very powerful political machine, which, like other machines, had

the great advantage of thorough organization, and could be overthrown only by heroic efforts. The campaign against Tammany has been spasmodic because people have not understood the foundations on which Tammany rests, and its significance in our political life. As a matter of fact, Tammany Hall is a political organization only in name; it is Democratic only by tradition; it stands for no political principle. There is no political principle which its leaders would not sacrifice; there are no party affiliations which they would not cast aside for the benefit of their organization. With them it is Tammany Hall, first, last, and always. They have based Tammany Hall, not simply on a high degree of political organization, but on certain instincts and ideas of conduct and life, on certain adaptations to the ideals and instincts of the large majority of their voters; and they have taken statesmanlike advantage of certain conditions which have existed in New York for many years, and which furnish a solid foundation on which their scheme of government can work.

Two things Mr. Hodder has shown with great clearness: the first of these is the broad distinction between what may be called the Anglo-Saxon ideals of character and of public service, and the Celtic ideals of character and of public service. Tammany does not stand for those qualities of character which are uppermost in the minds of English-speaking men and women when they think of the relation of the individual to the State. The vice of the politician of Anglo-Saxon descent, as Mr. Hodder has pointed out, is hypocrisy; that is never the vice of the politician of Celtic blood. Mr. Croker's frank declaration that he always "worked for his own pocket" is an instance in point. Such a declaration would never have been made by Mr. Quay or Mr. Platt. The Tammany politician often speaks the truth with perfect frankness because he does not understand the significance of the truth as revealing his own character. Tammany is largely supported by a class of voters whose ideals of life are social rather than ethical, and its leaders are men who incarnate the qualities of good fellowship, who care for their own, and look after their supporters. Let a man be genial, generous in his use of money; let him provide for his followers by generous disposition of offices or by a generous use of public funds, look after the wants of the poor, provide picnics, brass bands, processions; let him open halls where social gatherings can be held, and show himself a good fellow in the social sense, and it is a small matter to most Tammany supporters whether he does his work as a public official effectively and honestly or not. In other words, it is the social quality and not the moral quality which appeals to the average Tammany man, and it is the social rather than the moral nature to which Tammany appeals. Even if the Tammany man is honest, it is not the good of the city, the effective service of the public, that weighs with him; it is the care for his friends, loyalty to the Hall, and fidelity to his supporters. Men like Devery and Tim Sullivan, whatever else they may be, are perfectly frank in their dealings with the public. They have only a barbarian's sense of public obligation, but their names are significant of good will among their constituents, of all kinds of charity, public and private; of care of the poor, friendliness for those who are out of work, and a general paternal relation to everybody who can be made useful.

Tammany Hall is not only un-American in its methods, but it is distinctly un-American in its ideals. There is a broad and permanent difference between the underlying conception of public service in the minds of the best Tammany Hall men and the underlying conception of public service in the minds of the great mass of English-speaking men and women. That difference must be reckoned with. It is a permanent factor of great importance in the situation.

Mr. Hodder has spoken very frankly of the results of the co-operation of the puritan and the "grafter." What he has said has undoubtedly shocked a great many people. They ought to be shocked; they must be shocked until they are brought to a clear recognition of the fact that it is the combination of unpractical good people with very practical bad people that has made it possible for Tammany Hall to develop the combination between the municipal government and the criminal classes that has fed its treasury, enriched its officers, and made it infamous

throughout the world. Tammany finds its opportunity in the fact that laws which cannot be enforced are kept on the statute-books, by good people who will not recognize the fact that they are imposing on the city authorities functions which they cannot discharge. It is the body of unenforceable laws on the statute-books that has made it possible for the police captains, and Tammany functionaries in other departments of the government, to establish a regular system of blackmail on the vice of the city; to form an alliance with gamblers, saloon-keepers, houses of ill fame, and, in some cases, with crooks of all kinds, that has furnished a steady revenue for Tammany Hall, and enables police captains, on moderate salaries, to retire with considerable fortunes. This is the second fact upon which Mr. Jerome focuses attention in the speeches of the campaign, and which Mr. Hodder has brought out with his unusual analytical skill. The grafter, both Democratic and Republican, is able to ply his evil trade because the puritan stands behind him and thus becomes his silent partner.

The situation has been, in a way, unique. All Mr. Hodder's subtlety as a novelist has been brought into requisition to bring out the peculiarities of temperament and racial ideals which underlie the relation of Tammany Hall towards its supporters, and the unnatural and shocking partnership of puritanism and vice which gives the Tammany leader the opportunity of allying municipal government with the very classes which it is established, among other things, to suppress. To this may be added a third element: the co-operation, by unity of instinct and interest, of the Republican ringleader with the Tammany ringleader; the combination of machines to support each other and to defeat the will of the people. It has been a good many years since the people of New York have governed themselves. Twice in two decades two strong men have appeared—Grover Cleveland and Theodore Roosevelt—who have broken the bonds of the machines, and, by force of character, ability, and high aims, have pushed themselves to the front in the face of the machine leaders, Democratic and Republican. Tammany Hall hated Grover Cleveland precisely as Mr. Platt has hated President Roosevelt, and for the same reasons. The Republican machine in this city stands a great deal nearer the Tammany machine than it stands to the Republican voters of the city; and there have been combinations between Tammany and the Republican machine which have been antagonistic to the interests of the Republican party. For machines have no political loyalty; they exist for their own benefit. The Republican city machine would much prefer to have Tammany rather than Mr. Low and Mr. Jerome in authority. It would prefer a Democratic Governor rather than the presence of Mr. Roosevelt in the Governor's chair.

Mr. Hodder has concentrated his searchlight on two or three vital points; and at those points are to be waged the battles of the future in the city, in the State, and in the Nation. If our cities are to be redeemed, people must understand the utter selfishness of the machine, whether it calls itself Democratic or Republican, and set their faces against it like a rock. If republican institutions are finally to establish themselves in the world, the will of the people must control and not the will of the bosses.

❀

The Deadly Parallel

The New York "Times" in its issue of February 10 affords the finest illustration we have ever seen of the deadly parallel. It contains in literally adjoining columns two editorials on the Trust Question, as follows:

That any really serious and effective measure of trust regulation can be got through the Republican Senate is generally felt to be out of the question. The entire calmness of the great trusts and corporations reveals their confidence in the Senate, and men generally are altogether skeptical. If the Republican Congress was determined in good faith to attempt to provide a remedy for trust evils it would begin by striking off the duties on trust-made products.

The Elkins bill passed by the Senate last week without discussion or amendment is much stricter and more important than is indicated in the press reports. . . . If it should be passed and administered with care and vigor it would be the most efficacious remedy for such evils as really exist in connection with "trusts" that has yet been suggested.

You pay your money and take your

choice. And how great a choice for one cent!

"The Perfect Plan of Salvation"

A correspondent has sent us a "Tract No. 47," bearing the above title. It is published by "The General Missionary and Tract Society," of we know not what body of Christians, at Elgin, Illinois, and is sent postpaid for $1.60 per hundred. We therefore presume that any reader whose interest in it is aroused by this article can get a copy by sending two two-cent stamps to the Society, with a request for the tract. We have been interested in it because it seems to us to present, in an admirably clear, consistent, and logical form, what is *not* a perfect plan of salvation, but what in many quarters is conceived so to be, though rarely presented in so literal and logical a form. The perfect plan of salvation as outlined in this pamphlet may be briefly epitomized as follows:

Man is a religious being and needs a safe guide. The Bible is such a guide; it is the only infallible rule of faith and practice. The perfect plan of salvation is obeying its precepts and all its precepts. There is a heaven and there is a hell. The only safe way to win that heaven and escape that hell is to study the Bible, learn what are its precepts, and give to them a careful and exact obedience. Men must not select a part of the law; they must take the whole law and obey it in all its parts. Then, and only then, will they be safe. "Everybody admits that they who obey the *whole* law are on safe ground; the only difficulty is about those who obey but a *part* of the law." What, then, are the things which this law requires? In addition to repentance, faith, and confession, it requires baptism: "He that believeth and is baptized shall be saved." "On this as well as other positions we desire to occupy ground that is safe. It is never a question whether it is safe to be baptized. The uncertainty is about *not* being baptized; here is the unsafe ground." And baptism is immersion. "It is not questioned whether immersion is right, but are sprinkling and pouring right? About immersion being baptism there is not one particle of dispute among men of learning; all the dispute is concerning sprinkling and pouring." Therefore, "when we select immersion and that alone, then, and not till then, do we have a method that is infallibly safe." But immersion to be safe must be practiced by the forward action. "In the time of the Apostles the administrator placed his right hand on the head of the candidate, and gently bowed his head forward till he was fully immersed." Therefore to be safe we must practice the forward action. The backward action was not introduced into the Church until the time of the Reformation (A.D. 1517). "To suppose that God will sanction the backward baptism is to simply put the inventions of men on an equal footing with the 'thus saith the Lord.' We are not aware that he ever did sanction the introduction of a human invention in the room of a Divine appointment, and to presume that he will in this case is neither reasonable nor necessary. . . . We will stand on safe ground and go FORWARD in the likeness of our Saviour, when he bowed his head and gave up the Ghost." Moreover, immersion to be safe should be trine immersion. "If I take a candidate into the water and say, 'I baptize thee into the name of the Father' (then dip him), 'and of the Son' (dip him), 'and of the Holy Ghost' (dipping him the third time), there is no one who will say I did not do just as I said I would. . . . But if, on the contrary, I should say, 'I baptize thee into the name of the Father, and of the Son, and of the Holy Ghost,' then dip him, it is questionable whether I have done just what I said I would do. If in the former case I did what I said I would, then, in the latter, I did not. The former we know is right, but all the doubts are about the latter." Christ washed his disciples' feet and commanded them to wash one another's feet. Therefore to be safe we ought to wash one another's feet. "Those who do what Jesus commanded occupy safe ground in this particular; . . . all the difficulty is concerning those who refuse to obey this command." The Lord's Supper must be a *meal* and it must be a supper. There are people who take the Communion about noon, and then call it the Lord's Supper. "What does the reader think

of eating supper at noon? Can such a thing be done? Everybody knows that we can eat dinner at noon, but the question is, can we eat supper at that time?" If we want to occupy safe ground we must eat a meal, not a bit of bread and a sip of wine, and we must eat in the evening, not at noon. "The Holy Spirit of God, through the Apostle Paul, has said, 'Salute one another with a holy kiss' (Rom. xvi. 16). God is very precise in giving his commands. In this he not only tells us what to do, but *how* to do it. . . . He not only tells us to 'salute one another,' but, without leaving the matter to our choice, says it must be with a kiss; not only a kiss, but a *holy* kiss." "Is the salutation of the holy kiss a command of God? All parties must admit that it is. . . . Is it right to obey the command of God? To this there is but one answer, all admitting that it is right. Then the man who obeys this command does right. Is there any one who doubts this? Certainly not. But what if he does not obey this command of God? Does he do right? Is he safe? Here is where we meet with the doubts."

We have given a summary of this pamphlet thus at length, not because we suppose it represents a large body of Christians—probably they are numerically small—but because it represents clearly, consistently, logically, a conception of Christianity which is entertained vaguely, inconsistently, illogically, by a great many persons. This conception is, in brief, that Christ is a Lawgiver, that he who obeys Christ's laws will go to heaven, that he who disobeys them will go to hell. Consistent as the writer of this pamphlet is in his application of this doctrine, he leaves some things unsaid. Christ was baptized in a river; therefore it is not safe to be baptized in a lake, still less in a baptistery. Christ told his disciples to prepare the supper in an upper chamber; therefore it is not safe for us to partake of it in a church, a chapel, or on the ground floor. Christ said, "After this manner therefore pray ye;" therefore it is not safe to use any other form of prayer than the Lord's Prayer. On the other hand, Christ swept all these laws away on more than one occasion. He told a lawyer that if he loved God supremely and his neighbor as himself he should live; he told a rich young ruler that if he had not committed murder, nor adultery, nor theft, nor borne false witness, and had honored his father and mother, and loved his neighbor as himself, all that he needed to be *perfect* was to sell all that he had and give to the poor. To be safe, according to this, it is not necessary to have faith or repentance, to confess or be baptized, to pray or praise—it is only necessary to be just and generous.

The conception of the nature of salvation as from a future hell, and of its condition as obedience to precepts, is fundamentally erroneous. It is the conception of Pharisaism, against which Paul's letters are a protest; of Mediævalism, against which the Reformation was a protest; of Puritanism, against which the larger faith of our time is a protest. Salvation is not deliverance from hell, it is deliverance from sin; eternal life is not heaven hereafter, it is love, joy, peace, here; Christ is not a Lawgiver, but a Life-giver; Calvary is not a supplementary Mount Sinai, nor Jesus Christ a second Moses, nor the Sermon on the Mount an improved Ten Commandments, nor Baptism and the Lord's Supper a simplified Levitical code.

The laws of God are the laws of God's own nature; they are laws for us because we are God's children, and therefore they are the laws of our own nature. Christ is an interpreter of those laws, because he is an interpreter to us of God and an interpreter to us of ourselves. He interprets these laws to us by his life and spirit. They are all summed up in the one saying, "A new commandment give I unto you, That ye love one another as I have loved you." His life gives a new meaning and a new sacredness to love. We are saved when we imbibe his spirit and live his life. We are lost when we are sensual and selfish. To be Christlike is to be saved; to be un-Christlike is to be lost. Goodness is heaven; wickedness is hell. Christ has come to save us, not by giving us laws which if we obey here we shall go to heaven hereafter, but to inspire us with a life which is heaven here. The Gospel is not a new Law; it is not the old Law retranslated, reapplied, modified, amended, or enlarged. It is not law at all. It is Glad Tidings; and the Glad Tidings is, in a sentence, that we, poor as we are, can become sons of God as Christ was the Son of God;

filled with his spirit, living his life. This is what he means when he says, "I have come that they might have life, and that they might have it more abundantly." This is what John means when he says, "As many as received him, to them gave he power to become the sons of God, even to them that believe in his name." This is what Paul means when he says, "I can do all things through Christ which strengtheneth me." Salvation is character; and character is not wrought by obeying, from fear of hell or hope of heaven, precepts written in a book; character comes by receiving the life which is imparted by a Person—a gift which is freely given of God to whomsoever sincerely and supremely desires it.

❀

No Compromise with Death

There are some issues that are perfectly clear. One of these issues is before the people of New York State as represented in their Legislature. It is an issue between invested capital and human life.

People talk about the "housing problem" as if it were as abstract as a proposition in Euclid. As a matter of fact, the housing problem is as definite as the pallid face of an East Side child, as concrete as the burial of an East Side consumptive. If the reader of these lines has air enough to breathe, it is because he has solved the housing problem so far as he is concerned. To deny men, women, and children the solution of the housing problem is to deprive them of air for their lungs. It is because of the unsolved housing problem that people who are asking for air are given instead gases laden with tuberculosis.

There is just one obstacle to granting them air. That obstacle is invested capital. Last year there were over eight thousand deaths from tuberculosis alone in New York City. The prevalence of that disease was due, and is now due, to conditions in tenement-houses. Why permit those conditions, so far as they are preventable, to continue? There is only one answer that any man can give: Because any change in the conditions may endanger the income from investments in tenement-house property. There is no escaping the issue. It is life against money.

That issue was never more fairly joined than it is to-day in New York. The struggle has been going on for years. It is not necessary to narrate it here. It is sufficient to say that those who have been responsible for erecting tenement-houses in New York City have generally made them as unwholesome as the law has allowed. They have granted to the poor only so much light and air, only so much opportunity for life and health, as they have been compelled to grant. Finally last year a law was enacted stipulating, first, that every house thereafter to be built for the occupancy of three or more families should comply with certain designated requirements, and, second, that all old tenement-houses should be altered, when necessary, so as to be made more fit, in certain specified particulars, for human habitation. This law has now been in operation for some months. It has been proved entirely practicable. It has the approval of the best landlords. It has received the strong commendation of so eminently practical authority as the "Real Estate Record and Builders' Guide."[1] It has effected changes which The Outlook, after direct and personal investigation, declares to be wholly beneficial. Against this admirable law has arisen no protest on behalf of the people of the tenements, no argument on behalf of public health or morals, no opposition whatever except on behalf of those who fear reduction of income from investments in the old tubercular conditions.

Such opposition, so far from being an argument for modification of the law, is an argument for the maintenance of the law. In some quarters from which the public had a right to expect uncompromising defense of the rights of the poor come propositions for concession to the enemies of the poor. These concessions are defended on two grounds: first, that a reform government will be endangered if the pockets of unscrupulous or indifferent landlords are enlisted against it; second, that some concessions to the demands are necessary to prevent more radical demands. The first is idle, because a reform government that does not reform is of no use; the second, because conces-

[1] See the editorial in its issue for February 14, 1903.

sion to rapacity only increases the rapacity. If there is injustice in the present law, that injustice ought to be corrected, not as a concession to opponents, but as a voluntary measure of improvement. If houses of a certain height can be built with greater advantage to the people by changing in the law the specifications of the size of the required court, those specifications should be changed only at the request of the Tenement-House Commission; not because of pressure from builders who wish to save money by wasting lives, but because of honest opinion that the houses will be thereby improved. We strongly doubt whether either justice or public advantage demands any such changes. But, in any case, neither justice nor public advantage makes it necessary for the government to restore conditions favorable to disease and death for the sake of making secure the continuation of incomes derived from the promotion of disease and death. No government is under obligation to protect investments in instruments for populating the hospitals and graveyards.

The dwellers in the tenement-houses on the lower East Side of Manhattan are becoming aware that their hard-won rights to light and air, health and life, are menaced. By placards, by utterances in their newspapers, by petitions, and by public meetings they are expressing their fears and making known their appeals. They ought not to be left to fight their battle alone. It is hard enough for them to fight their environment without fighting men who would permanently fasten that environment upon them. In Buffalo, too, the people are aroused. They realize that what they achieved in former years by local ordinance is now embodied in the State law, and will be lost if the law is annulled. The people of Brooklyn, however, do not seem to be aware that this attack on the law, which is especially virulent in their borough, is a threat, not only to maintain present conditions, which are already foul enough there, but to fix upon them for the future a condition that will be fertile in physical and moral evils.

If a democracy involves any obligations to one's fellow-men, indifference in a struggle like this is a form of treason. The "housing problem" is not merely a problem; it is a war. With the forces of death there can be no compromise.

The Impressions of a Careless Traveler

IX.

April 19.

ODESSA: our last port in Russia and our last in the Black Sea; after the Crimea and Yalta a decided anticlimax. I wish we might have had added to the very short time allotted to Athens all that which we spent in going around by the western coast of the Black Sea in order to visit Odessa. But evidently all persons are not of this way of thinking. A fellow-passenger tells me that when he expressed to a friend regret that he was to have only two days at Athens, the friend exclaimed: "Two days! why, man, two hours is enough to see all there is in Athens." Poor man! This recalls a story, told me by another fellow-passenger, of a lady who, returning from an excursion on the Nile, said that she did not see what any one wanted to go to Egypt for; "the hotels were poor, the food was bad, the boats were slow, the water was muddy, and the temples were all in ruins." There are no ruins in Odessa. It is a thoroughly modern city, with fine docks, broad streets; well built, commodious-looking modern houses; good restaurants—we tried one; good-looking hotels, though we had no cause to try one; no beggars; good shops—we bought little but did some shopping; no dogs, no dirt, no smells, in all of which respects it is a striking contrast to Constantinople. It is the westernmost commercial city in Russia, I believe, certainly the westernmost port in the Black Sea, and is connected with eastern Europe by an efficient railway system. It interested me because it indicated what sort of a city Constantinople would become in a quarter of a century if Russia owned it. I cannot tell whether I wish she did or not. If she did, she would control the eastern Mediterranean and so the Suez Canal. For

the Sea of Marmora would be the natural rendezvous for her fleet, and Great Britain could neither afford to keep a fleet perpetually coaled and ready for action in the Mediterranean nor to leave her highway to the Indies unprotected. "But," said a fellow-passenger to whom I made this remark, "the neutrality of the Suez Canal is guaranteed by treaty." True; but Russia has not a habit of observing treaties when it is not to her interest to do so. Moreover, Russia's treatment of Finland augurs but ill for the Bulgarians, the Armenians, and the Greeks, if they should once come under her protecting wing. I am glad that it does not devolve upon me to determine whether western Asia and southeastern Europe, with the Bosphorus and the Dardanelles, shall be under the Greek cross or under the Crescent. To-night we are sailing for Constantinople, where I believe we are to come to anchor just long enough to leave two passengers and then go on to Athens.

April 23.

Athens in a day and a half! We were in Athens at half-past nine yesterday morning; we left it at half-past three this afternoon. In the interim we had visited old Athens, driven through new Athens, visited the Museum, interviewed and taken tea with Dr. Kalopatharkes, a native Protestant preacher, and brought away our impressions, which in my case are at once vague and confused if not contradictory.

Both in Greece and in Italy I am specially interested in the resurrection of the people—for in both I seem to see a new people rising from the grave of the dead past. And in some ways the resurrection of a nation, as one sees it in Italy and Greece, is more interesting than the making of a nation, as one sees it in America. The contrast between ancient and modern Athens is very striking. Piræus, the harbor of Athens, is a commercial city of considerable size and great activity. The statement made to me in Athens by a native Greek, that Piræus is the second largest commercial port in the Mediterranean, is probably a characteristically Greek overstatement; possibly also his declaration that sometimes there are as many as a hundred steamboats in its port at once; but it is a thriving city, and when the Greek railroads make their connection with the European system, it will become a port of still greater importance. Athens itself is a beautiful city, with broad avenues, some fine residences, and some notably fine public buildings. One of these, or rather a group of them, the Academy of Science, Polytechnic Institute, etc., is built in imitation of the ancient Greek temples, with the colored marbles and the frescoed friezes; and while it lacks that indefinable something which characterizes the spontaneous and original and is never to be found in a copy, it is a very beautiful group, and is a great help to the imagination in the endeavor to reconstruct the ancient Greek temples from the pathetically beautiful ruins which have survived the erosions of time and the barbarisms of man. There are other modern characteristics of Athens not so attractive. The ancient Greek was not only an athlete and an artist, but also a great bargainer and a not too scrupulous one. If the new Athenian brings from the dead past, as I think he does, something of the ancient Greek's æsthetic sense, he also brings something of his bargaining spirit. Much more than in Genoa or Tiflis I felt the atmosphere of a community bent on making all it could out of the transient visitor. Our hotel charged us five dollars a day, which was two dollars more than the rates announced in Baedeker, and would have given us second-rate rooms at that but for a demand for something better. The excuse was, "the height of the season." And nowhere else in my European experience have I ever had such an array of servants presenting their claims for fees. At the end of only a thirty hours' sojourn, one porter brought our hand luggage down stairs, two others took a dress-suit case apiece, and a fourth opened the carriage door; and all, to say nothing of waiter, chambermaid, upstairs man, and head porter, were on hand for a remembrance. Guides, cabmen, and peddlers of all sorts were present wherever we went, and I am told that in shopping a double price is the rule, as in Turkey. In short, put the Parthenon in Saratoga or Long Branch and one would have some conception, though an inaccurate one, of the combination of modern commercialism of a petty kind and ancient art as one sees them in Athens. *Per contra*, there was no gate money.

However, these aspects taken alone

give an unfair notion of modern Athens; of its general air of prosperity; of its schools, of its children, of its homes. That the whole of Greece has moved upward and forward with astonishing rapidity since the expulsion of the unspeakable Turk, as has Italy since the overthrow of Bourbonism and the Papal power, that in both countries the revolution has taken away the stone from the mouth of the tomb, and the nation has been summoned forth although still encumbered by its grave-clothes, is very apparent. One of the most interesting illustrations of this new life was afforded by the so-called "Queen's workshop." It is, as I understand it, a factory organized and patronized by the Queen for the benefit of women and girls of the poorest class, who are engaged here in weaving various fabrics, from woolen carpets to silken scarfs. I am not expert in such matters, but their work seemed to me to be in good taste and thoroughly well done; and the ladies of our party thought the product very reasonable in price. What struck me as most distinctive was the fact that the power, I believe all the power, was furnished by hand. Two women turning a crank furnished by their muscle the power which moved the loom; and the shuttles were driven back and forth wholly by hand.

The Acropolis we saw under what was at once a great advantage and a great disadvantage. We started to see it by ourselves; fell in with two congenial fellow-passengers who had secured a very good guide—not a human parrot, but a man of intelligence who could understand and answer questions; we accepted their invitation, went with them, and had everything explained to us in a very intelligent manner. This was a great advantage, because we saw a great deal which otherwise we should not have seen, and learned a great deal which otherwise we should not have known. It was a disadvantage, because it made the Acropolis a show place; we could not sit down quietly to the æsthetic enjoyment of what I suppose to be the most beautiful ruins in the world, nor possess ourselves in that quiet of mind which is essential to the work of the imagination and so reconstruct from our fragmentary knowledge the ancient Acropolis, and people it with its splendid but sensuous life. I did this for myself in the afternoon, when I went out to Mars Hill unaccompanied, and stood there for a while looking across to the Acropolis directly opposite and close at hand, and, forgetting the present, saw before me enacted the historic scene which took place there one afternoon about eighteen centuries and a half ago. Then the temple was unimpaired; the trees were unbroken; the marbles which one must now go to the British Museum to see were in their places; Athens was no longer in its glory, but the priesthood was still powerful, and the pageantry and processions imposing. I saw the long procession winding up the hill and climbing the broad staircase which leads to the most beautiful temple ever erected by man to express his reverence for the gods; I saw the white-robed priest, the attendant boys, the mild-eyed oxen, which Homer has described and which the Greek bas-reliefs portray, led up to the sacrifice; I heard the rude chanting and the murmurs of the spectators; I shared their feeling of awe in the presence of the great mystery of life and death, which at times sobers and solemnizes the most careless of us; and then I saw Paul, alone and unfriended, on the hill over against the Parthenon, despised by the Greeks because he was a Jew, and despised by the Jews because he was half Greek; a fanatic to the one, a heretic to the other, suspected even by his own church, and setting over against this beautiful temple and this impressive pageantry and this all-powerful priesthood—what? An idea, words, mere words, a breath, a palpitation of the air, audible for a moment—then gone forever. And yet! the pageantry has long since ceased to impress, the priesthood have long ceased to influence, the sacrifices are no longer offered, the music is no longer heard, the temple is only a beautiful ruin—but Paul's speech on Mars Hill, preserved we know not how nor by whom, will live as long as reason vivified by imagination and surcharged with emotion has power to move the mind of man. As I reflected on this contrast, the history of the intervening centuries, which the guide in the morning had skillfully epitomized in a few sentences, came back to me with its lesson. I felt rather than defined even to myself the difference in spirit between Paul and

the later religionists who, in the same place, have endeavored to reform religion. The Christians turned the Parthenon into a Christian church, put up an altar, painted on the walls some frescoes of saints—the dim outline is still discernible there—substituted for the pagan ritual a Christian ritual, and for the pagan creed a Christian creed. The Mohammedans followed; tore down the altar, tore down the cross, effaced the frescoes, knocked the heads off from the images, and put up a tower for their call to prayer. The later Christians came in again, tore down the tower, and effaced as far as they could the signs of the Turkish occupation. Each religionist saw in creed and ritual and altar and image a symbol of a hated religion, and tried to reform it by destroying it and putting another symbol in its place. Paul criticised neither ritual, creed, nor image. He praised the pagans for their religion. "I have come to help you," he said in effect, "to understand better the God you worship but confess you do not know." I never felt so strongly the folly of all this controversy about creeds and rituals and images—the mere symbols of religion; I never felt so strongly the splendid courage of this man standing alone in the midst of all this pagan symbolism and offering absolutely no substitute for it all and no criticism on it all; offering only a thought, an idea, a truth—invisible, impalpable, immaterial, unsymbolical, and therefore eternal.

Returning to the steamer, I was much interested to compare notes with my fellow-passengers, and see how various are the interests which Athens awakens and how many and different are the points of view of visitors to it. To one the interest was æsthetic—the beauty of the ruins impressed him, the fact that all the lines, even those of the seemingly straight but imperceptibly curved pillars, were lines of beauty; to another the historical associations—here Socrates taught, and Demosthenes spoke, and Sappho sang, and Phidias wrought; another saw in the splendid ruins a type of the Greek character—they belong to a people who used the same words to designate beauty and goodness, and who sought for the golden mean in philosophy, for self-control in character, and for perfect proportions in architecture; in another, indignation at the vandalism which had destroyed the ancient temple drove out every other emotion—indignation at the mediæval Christians for despoiling the world of a stage and a drama of such beauty, indignation at the Mohammedans for beheading the statues and converting the Parthenon into a powder magazine, indignation at the Venetians for bombarding it, indignation at Lord Elgin for carrying off the frieze to enrich the art treasures of London; another wondered how such a temple could have been reared by a people who knew nothing of our modern engineering appliances, and reported how the guide told him that mounds of earth were heaped about the pillars and the great stones rolled up and put in place, and then the mound increased and another stone rolled up, and the process still repeated until at last the pillar was surrounded by an embankment nearly as high as itself, which, when the pillar was complete, was carried away again; still another was chiefly interested in the connection of modern with ancient Athens, as, for example, in the fact that the modern water-works of Athens use the aqueduct of the ancient city, built, I believe, centuries before the beginning of the Christian era. To me Athens was of interest chiefly as the point in Europe where the forces between Christianity and paganism first really joined in battle, and then and there commenced that long campaign between sensuous and spiritual religion, between the worship of the symbol and reverence for the invisible reality interpreted by the symbol, between a religion of emotion and a religion of conduct, between the fear of the gods and love for the All-Father, which will not end until the kingdom of God has come on earth as it is in heaven. But I must confess to myself, to use Matthew Arnold's phraseology, that I am a Hebrew, not a Greek; and it requires a Greek mind to understand and interpret Athens.

We sailed from Athens this afternoon; we are due to arrive at Naples on Friday, the 25th, where we leave the Prinzessin. My anticipation of delight in seeing Naples, Rome, Florence, and Venice for the first time does not prevent the feeling curiously akin to homesickness at the idea of parting from the ship which has been our home for these six delightful weeks.

L. A.

HOLDING UP A STATE

THE TRUE STORY OF ADDICKS AND DELAWARE

BY GEORGE KENNAN

III.

WHEN, on the 8th of November, 1894, Mr. Addicks told the fourteen gentlemen who sat around the dinner-table of Charles L. Moore, in Georgetown, "I've bought it; I've paid for it; and I'm going to have it! It has cost me $140,000!" he entertained no doubt, apparently, that the legislators whom he had just elected, at a cost of $140,000, would make him United States Senator. When the Legislature assembled, however, and the voting began, it became apparent that, although the Republicans had a majority of eleven on joint ballot, Mr. Addicks could control only six of them, and needed five more votes. He therefore turned his attention from buying votes in the Representative and Senatorial districts to buying votes in the House and Senate. Selecting, from his "inventory" of that year, the names of half a dozen legislators who, he thought, might be purchased, he set his agents at work, with instructions to "get" them. Some of his workers seem to have been willing to pay as much as $10,000 per man. At any rate, one of them asked a well-known member of the Sussex County Republican Committee whether that amount would tempt State Senator George Fisher Pierce. It evidently did not tempt him, as he voted against Addicks throughout the legislative contest of that year.

In another case, the sum of $10,000 was offered to the brother of a certain legislator, upon condition that he should "use his influence" in Mr. Addicks's behalf—such influence, presumably, to be used with the brother.

In a third case, the tempter, after vainly endeavoring to buy the vote of a Sussex County legislator, went away, leaving $1,000 on the table of the man whom he still hoped to "get." The legislator returned the money, and subsequently told a friend of his and an acquaintance of mine, in Dover, that if he (the legislator) would vote for Mr. Addicks, he "might own a block of buildings" in that city.

Mr. Addicks's efforts to "influence" Senators and Representatives in the Legislature of 1895 seem to have been wholly unsuccessful. He could not obtain a single vote in addition to the six that he controlled on the first day of the session, and one of his political "heelers" from Massachusetts was so disappointed and disgusted that he said to a member of the Sussex County Republican Committee, "It's a damned queer state of things down here in Delaware! In Boston Mr. Addicks can get all the men he wants for $5,000 apiece, but if there's a man in this damned Legislature that can be bought, I haven't found him!"

Mr. Addicks himself said to a prominent State Senator, on a railway train between Dover and Harrington, that he had bought the Senatorship, and that he was going to have it, *even if he had to buy it again.*

The fight in the Legislature that year (1895) lasted more than four months, and toward the end of it two of Mr. Addicks's adherents forsook him, leaving him with only four. These four men he succeeded in holding to the very end of the session, although one of them made a desperate effort to break away. With fifteen anti-Addicks Republicans on one side and a combination of eleven Democrats with four Addicks Republicans on the other, there was a tie, and consequently a legislative deadlock. Then the Governor of the State died, and, in accordance with law, Mr. William T. Watson, the Democratic Speaker of the Senate, took his place. The withdrawal of the latter from the Legislature left the anti-Addicks Republicans with a majority, in joint session, of one (15 to 14). They were about to elect their candidate, Colonel Du Pont, as United States Senator, when Mr. Addicks,

it is alleged, induced Speaker Watson to return and vote in the Legislature while occupying the chair of Governor, thus bringing about a tie and another deadlock.[1] When the Legislature adjourned and the long struggle ended, in May, 1895, the anti-Addicks Republicans declared that inasmuch as Mr. Watson had no legal right to vote in the Legislature while acting as Governor, their majority of one had elected their candidate, and Colonel Du Pont was *de jure*, if not *de facto*, United States Senator. The United States Senate, however, did not take this view of it, and, by a party vote, refused to allow Colonel Du Pont to take his seat.

At the end of his long but unsuccessful fight for the Senatorship in this campaign, Mr. Addicks sent to Senator Washburn, of Minnesota, the telegram to which he evidently referred in his interview with Representative Ball, described in my first article. It was as follows:

"The Republican party will carry Delaware next year pledged to Addicks for Senator. I made Delaware Republican. If the Republican party is the party of treachery, I will help bury it ten thousand fathoms deep."[2]

The substance of Mr. Addicks's complaint was that he had spent $140,000 in electing the Republican members of that Legislature, and had then failed to get the "goods" for which he had paid. The failure to deliver, on the part of the Republicans, was equivalent to "treachery," and he therefore proposed, when he should elect a majority in another Legislature, to have the members of it "pledged," and then hold them to their pledges, or bury them "ten thousand fathoms deep."

In December, 1895, the leading Republicans of Newcastle County held a meeting to denounce the methods of Mr. Addicks, and to ask the County Committee to expel its member, Robert J. Hanby, on account of his co-operation with Mr. Addicks and the Democrats in the fight for the Senatorship that year. At this meeting Mr. William Michael Byrne, whose nomination as United States District Attorney for Delaware is now pending in the United States Senate, attacked and denounced Mr. Addicks in the most emphatic language, and declared that no decent Republican ought to have anything to do with him. He signed the resolutions of protest and denunciation drawn up at that meeting, as did also the principal members of the Byrne family, including Alexander P. Byrne, James E. Byrne, P. J. Byrne, Michael Byrne, and John L. Byrne. Five years later, however, Mr. William Michael Byrne seemed to get some new light on Mr. Addicks's character, and soon afterward became one of the latter's supporters, and eventually his candidate for Congressman.

In 1896, by the lavish use of money, Mr. Addicks succeeded in getting a majority of the delegates to the State Convention to elect delegates to the National Republican Convention held that year in St. Louis. This led to a split in the party, the anti-Addicks Republicans bolting and sending to St. Louis a contesting delegation of their own. Upon full consideration of the evidence presented, the Committee on Credentials at the St. Louis Convention recommended the seating of the anti-Addicks delegation, and declared that Mr. Addicks and his delegates "did not represent the Republican party in Delaware, or anywhere else;" that they were merely "highwaymen on the road to political fortune, no matter what might be the result to the Republican party." Mr. Addicks thereupon formed in Delaware an organization of his own, under the name "Union Republican," and nominated his own State ticket. This divided the strength of the Republican party and enabled the Democrats to elect their Governor, as well as a majority in the Legislature that gave them both Congressman and United States Senator. In 1897 Mr. Addicks threw into the hands of the Democrats, in the same way, a majority of the delegates to the convention called for the purpose of framing and adopting a new State Constitution.

In 1897 and 1898 Mr. Addicks perfected his organization and strengthened his lines, using money, as before, to pay workers, get hold of locally influential men, and buy votes. How much he spent in these years it is impossible to state; but he admitted, in the Creelman interview, that he had used in Delaware the sum of $250,000; and his lieutenant, Dr.

[1] "Reply of the Republican State Committee of Delaware to a Communication from J. Frank Allee, Chairman of the Union State Committee," p. 3.

[2] Quoted from the "Reply of the Republican State Committee to the Chairman of the Union State Committee," p. 4.

Layton, told a friend in 1900 that, up to that date, he had expended $400,000 in campaign years alone. Mr. Manlove Hayes, of Dover, one of the oldest, most experienced, and most respected politicians in the State, has said that it is practically impossible to spend more than $10,000 in Delaware, honestly and legitimately, in a single campaign. Mr. Addicks, by his own confession, spent three times that amount, and by admission of Dr. Layton eight times that amount, in every campaign. It is not surprising, therefore, that in the Legislature of 1899 the number of his supporters had grown from four to eighteen. As the new State Constitution, however, had increased the total membership of the General Assembly to fifty-two, he still needed fourteen votes. His workers thereupon undertook, as usual, to buy legislators; and if it was found impossible to purchase a man outright, an attempt was made to bribe him to feign sickness and stay at home when the critical and decisive vote should be taken. In one case, for example, reference to the "inventory" showed that a certain Representative had indorsed notes that were not likely to be paid, and had thus incurred a liability of $4,000 or $5,000. One of the Addicks workers told this man that if he would simply stay at home, on some plausible pretext, when notified to do so, the indorsed paper would be taken care of and he would be protected from loss.

In another case the Addicks worker was taken into court on a charge of attempted bribery, and was there prosecuted by Mr. Charles F. Richards, of Georgetown, who was then Attorney-General of the State. Mr. Latamus, a Representative in the Legislature, swore that one Davis, an adherent of Mr. Addicks, offered him $5,000 for his vote. Counsel for the State regarded the evidence against Davis as conclusive, but the jury failed to convict. It has since been said that the jury was "fixed;" but, so far as I know, evidence to support that charge has never been furnished. In most cases of this kind there were no witnesses to the transaction, and the sworn statement of the legislator that John Doe had attempted to bribe him was offset by the sworn statement of the briber that he had done nothing of the sort. Somebody lied under oath; but nobody could be legally convicted of perjury.

The people of Delaware generally, and the State legislators in particular, are entitled to great credit, it seems to me, for the steadiness with which, for a long series of years, they resisted temptation. Mr. Addicks, by means of his "inventories," kept himself and his workers fully informed with regard to the financial circumstances of all influential men in both opposing parties, and whenever a legislator, or a local politician of note, became embarrassed, as the result of indorsing bad paper or going on the bond of a dishonest tax-collector, whenever such a man found himself "in a hole," and did not know what to do, or which way to turn, there was an Addicks worker at his elbow with an offer to extricate him from his difficulties and lift from his shoulders the burden of anxiety. And yet, in spite of all this, and in spite of the fact that Mr. Addicks was willing to spend from $80,000 to $140,000 in every campaign, his experienced Boston worker declared in 1895 that if there was a single man in that Legislature who could be bought, he had not found him.

Toward the close of the legislative session of 1899 three Democrats were induced, in some way, to vote with the Union Republicans for Mr. Addicks, thus increasing his strength to twenty-one; but their desertion of their party created such a storm of excitement and indignation in the crowded Assembly chamber as to deter others—if there were any others—from joining in the movement, and the Legislature adjourned without electing any one to take the seat of Senator George Gray, whose term was then expiring.

In the year 1900 each of the Republican factions in Delaware sent a delegation to the National Republican Convention in Philadelphia. The Addicks men, after capturing the Committee on Credentials, were finally seated; and as a result, doubtless, of the recognition and support thus given them, they succeeded in electing that year 22 legislators out of 52, and in reducing the numerical strength of the Regular Republicans to 7.[1]

After another long and obstinate struggle the Legislature adjourned, without filling either of the vacant seats, and

[1] Thirteen Republicans voted against Mr. Addicks at the opening of the session, but only seven held out to the end in opposition to him. These seven men were all from the county of Newcastle.

Delaware was left wholly without representation in the Senate of the United States. This brings the record of Mr. Addicks's operations down to the campaign of 1902, with which I dealt in the first article of this series. At the beginning of his political career, in 1889, Mr. Addicks seems to have had in the Legislature only a single adherent. In 1895 he had six, four of whom he controlled to the end of the session. In 1899 he had secured eighteen; in 1901 he had twenty-two, fifteen of whom he held to the end; and he now declares that even if he be not elected by the present Legislature, "we will wipe them" (the opposition) "off the face of the earth next year, and be able to elect anybody we want."[1] There is no doubt that Mr. Addicks has the courage of his convictions, and of his financial resources; but it is possible that "newspaper criticism," to which, as he informed the New York "World" correspondent, he is "utterly indifferent," may yet get inside his guard. The newspaper press of the United States—as Alan Breck said to David Balfour of himself, after a lively skirmish—is "a bonny fechter."

I shall now describe, as fully as I can in the space that is left me, the working of Mr. Addicks's political "machine," and the methods by which he buys votes, packs primaries, and gets hold of legislators.

The most valuable and useful cog in Mr. Addicks's machine is, unquestionably, the voter's assistant. When the State of Delaware adopted the Australian ballot system, it was thought necessary to provide the illiterate voter—and especially the negro—with expert assistance in the marking of his ballot. The Governor was therefore empowered and directed to appoint, for every polling-place, two voter's assistants—one from each of the two dominant parties—whose duty it should be to read or explain the ballot to the voter and assist him in marking it. It was not long before these voter's assistants became—as Mr. Willard Saulsbury said in his letter to Governor Hunn[2]—mere "tally clerks to see that purchased voters delivered the goods." As the Union Republican party, in recent elections, has been one of the two principal parties, it has had its own voter's assistants, and has used them to keep watch and tally of its purchased vote. If Mr. Addicks had not been able, by means of these officers, to check up his expenditures and make sure that he received the votes for which he had paid, he would not now have twenty-one Senators and Representatives voting for him in the Legislature of the State. Voters might have taken his money just as freely, but many of them would not have "delivered the goods."

In practice, the voter's assistant part of Mr. Addicks's machine consists of a secret booth, a corrupt voter's assistant, a cashier's office, and a cashier. The workers make "deals" with purchasable voters before election day, and then furnish the cashiers with lists of men bought and amounts of money promised. When the purchased voter goes to the polls, the corrupt voter's assistant sees that his ballot is properly marked and deposited, and then gives him something in the nature of a token, as a proof that the goods have been delivered. The voter thereupon goes to the cashier's office, surrenders the token, and receives the amount of money set opposite his name on the worker's list, which has previously been turned over to the cashier for the latter's guidance.

At one polling-place in the Baltimore hundred, in the early days, the token given to the purchased voter was a chestnut, which the assistant put into the voter's pocket. It soon became noised about among the colored men of the village that ordinary chestnuts at the cashier's office were bringing $10 apiece. Two or three negroes provided themselves with chestnuts from private sources of supply, and went boldly into the cashier's office to get money for which they had rendered no service. To their great surprise and disappointment, they were promptly hustled out, minus chestnuts and without any money. All chestnuts looked alike to them, and they could not understand what was wrong with their chestnuts, until they learned a few days later that all the chestnuts of the voter's assistant had been carefully and thoroughly boiled, for easy

[1] Statement made by him to the Dover correspondent of the New York "World," February 6, 1903.

[2] Letter written to Governor Hunn by Willard Saulsbury, Chairman of the Democratic State Committee, on the 4th of September, 1902, asking that the question of the constitutionality of the voter's assistant law be referred to the Chancellor and Judges of the Supreme Court of the State, in accordance with Section 4, Chapter [illegible] of the Revised Code of 1893.

identification and as a precaution against this very trick.

The Addicks managers now provide their voter's assistants with tokens that have been bought outside of the State and that cannot be easily duplicated or counterfeited. In Dagsboro, in last fall's election, they used a red celluloid button of a peculiar form which could not be obtained in Delaware. In the Baltimore hundred they had tin tags stamped "O. K." Tin tags were also used in Milford, Kent County. In other representative districts purchased voters were given a certain number of links of a small, fine chain, or peculiar large-headed black pins, which they stuck in their coats when they went to the cashier's office for settlement.

The system was ingenious and worked well; but in some parts of the State, where the voter's assistants could be fully relied upon, money was given directly to them, and they paid for votes in their booths. This was safer than making settlements outside and involved less trouble.

A member of the present Legislature told a well-known citizen of Wilmington that he had bought his own voter's assistant and two others; and yet, when he took his seat in the General Assembly, he was required to swear that he "had not directly or indirectly paid, offered, or promised to pay any money or other valuable thing as a consideration or reward for giving or withholding a vote at the election at which he was elected."

Purchased voters, in many cases, allowed the voter's assistant to mark and fix up their ballots to suit himself. A negro, who is well known to guests of the Hotel Richardson in Dover, upon being asked by a white man in whom he had confidence whether he got his pay for his vote in last fall's election, replied, with a grin of pride and satisfaction, "'Deed I did, Mr. X——. I got twenty dollahs! I sot right down onto Y——'s steps, an' I tole him I wasn' goin' to vote till I got my money. I waited till pretty nigh six o'clock, and then I got it—twenty dollahs!"

"You were a sensible nigger! You wouldn't 'a' got more'n ten in the forenoon. Who'd ye vote for?"

"Vote for? How sh'd I know! Billy Blank" (the voter's assistant) "did the votin'."

In one village in Sussex County the Addicks cashier was a general storekeeper. Between elections he sold goods on credit to poor Union Republican voters, and then, on election day, deducted the amounts that they owed him from the money put into his hands to buy their votes with.

Vote-buying in Sussex County was so common and general that evidence of it appeared in all kinds of unlooked-for places and in all sorts of transactions. Just before I visited Georgetown an assault and battery case came up before Justice of the Peace Purnell. In the course of the proceedings the complainant, who was a woman, testified that her husband, with whom she had had the trouble, did not properly support her. "Last election," she said, turning indignantly to her husband, "you sold your vote, and you showed me the money; and you wouldn't even give me any of that!"

In another place a Union Republican tax-collector went to the Addicks cashier on election day and asked the cashier to give him the names of voters purchased so that he might collect taxes from them while they had the money. He got a list of twenty-seven delinquents, and proceeded at once to look them up.

In the same county the levy court commissioner, whose duty it was to make up the panel of jurors, told a friend that it was becoming more and more difficult to keep off that panel men who, to his certain knowledge, had sold their votes. He was a Union Republican official, but he admitted the probability that a man who had taken money for his vote as an elector would also take money for his decision as a juror, and he did not think it right to include in the panel men of that character.

When Mr. Addicks's agents first began to buy votes in southern Delaware, they could "get" only a part of the negroes, and a few men from the poorest class of whites; but the corrupting influence of money, used boldly and with impunity throughout a long series of years, finally had its effect upon men of a higher type—men who could not plead poverty as an excuse for their acts. Well-to-do farmers in Sussex County, who own their farms and have money in bank, now sell their votes regularly every other year; and as

for the colored population, which polls in the two lower counties a vote of about five thousand, it has been corrupted *en masse*. Many informants in Kent and Sussex told me that in the circle of their personal acquaintance they did not know a single negro who "voted his sentiments." Every man of them sold his vote for what it would bring.

Temptations for white men of the better class, country lawyers, doctors, merchants, and local politicians, are thrown broadcast, on the chance that they will "get" the men. If Mr. Addicks asks a country lawyer for an opinion with regard to some unimportant matter, and the lawyer sends a bill for fifty dollars, he receives a check for five hundred. If an influential country merchant finds himself in need of a temporary loan, he is informed by one of Mr. Addicks's agents that he can get it, without security or indorsement, of a certain person or at a certain bank. If an unfortunate harnessmaker or blacksmith, who would make a good worker, has just been sold out by the sheriff, he is "approached" by an Addicks agent, and in a few months he resumes business and begins to build himself a house. If a man happens to be on the bond of a defaulting tax-collector, and is forced to sell personal property and give a note in order to meet the sudden and unexpected liability, he is informed that by using his influence in favor of Mr. Addicks he can straighten the matter out at once, without trouble or loss. If an Addicks agent of the higher class sticks faithfully to his employer, and renders efficient service, he is made an officer or director in the Bay State Gas Company. One of Mr. Addicks's principal supporters in Delaware is Secretary of State; another is Insurance Commissioner; a third is President of the Bay State Gas Company; and a fourth is State Superintendent of Schools.

If an Addicks agent wishes to get hold of a man of honor and principle—a man whom he knows he cannot buy—he goes to him and says, "I know very well, Mr. G——, that you can't be improperly influenced in any way; but I want to lay our case before you and ask a favor. We are having a hard struggle in this district, and are fighting against the combined corruption funds of two parties. The odds are two to one against us, and we haven't a fair show. Now I'm authorized to offer you a thousand dollars, upon the sole condition that you'll see, as far as you can, that we get a square deal in this district. We don't ask for your vote, and we don't want your influence unless you feel disposed, voluntarily, to give it to us. You may vote and talk as you like—against us if you choose—but just look out for us a little, and if we don't get a square deal here, let us know." If the man is poor, and if he needs the money, he is very likely to yield to this temptation. He will probably say to himself, "There's nothing wrong about that; every man is entitled to a square deal; I'm not selling my vote, my influence, or my independence." But if he takes that thousand dollars, he is lost. Two years later he will take more, and if, finally, he becomes alarmed or repentant, and endeavors to escape from the net, the agent says to him coolly that his best course is to join their ranks, inasmuch as he will probably find it very difficult to explain to his neighbors and the public why he took Mr. Addicks's money, when the fact that he did take it shall become known.

Of the evidence obtainable in Delaware with regard to the use of depraved women as a means of disgracing legislators and enabling workers to hold or control doubtful men by threats of exposure, it is not necessary, at present, to speak. I must save some space for a consideration of the difficulties in the way of criminal prosecution, and for a few brief comments on Mr. Addicks's character.

Upon a review of all the facts set forth in this and preceding articles, the reader who is not familiar with the Delaware situation will naturally ask, "Why do not the honest men of the State prosecute these bribers and vote-buyers in the courts? If the facts are so notorious and the evidence so accessible, why are none of the Addicks workers in the penitentiary?" There are several reasons. In the first place, three attempts to convict of election offenses in Delaware have failed. Davis was found not guilty by a jury said to have been "fixed," while Moore and Reiman, who were tried by a bench of judges under the provisions of the new State Constitution, were acquitted by a divided court.[1] The law now de-

[1] Lore and Pennewill for acquittal, Grubb dissenting.

clares that "no person shall be adjudged guilty of any offense mentioned in Section 7 of this Article" (an election offense) "without the concurrence of *all* the judges trying the case." I am not competent to express an opinion with regard to the rightfulness or wrongfulness of the court's decision in the cases above referred to; but the effect of it was, apparently, to discourage prosecutions.

In the second place, there is no doubt whatever that votes have been bought in Delaware by Democrats and Regular Republicans, as well as by the agents of Mr. Addicks. Dr. Layton says that the Democrats, in 1894, had a corruption fund of $26,000. It is quite possible, but I do not think that in recent years they have been able to raise anything like that amount of money for election purposes. The cases of vote-buying by Democrats and Regular Republicans that came to my knowledge in Delaware were of this sort: When, in some village or small town of Kent or Sussex, the Democrats or Regulars found, late in the day, that their own voters were being captured by the Addicks workers, they put their hands in their pockets, raised a few hundred dollars, and tried, by offering cash inducements, to hold their own negro voters to their party allegiance. Sometimes they had a small fund ready for such an emergency—as, for instance, at Camden in the recent election—but they seldom used it, for the reason that the Addicks workers could bid five dollars to their one. Inasmuch, however, as vote-buying on a small scale is just as much a crime, under the law, as vote-buying on a large scale, they could not prosecute without being prosecuted. By a foolish attempt to fight Mr. Addicks with his own weapons, they lost the advantage they might otherwise have had.

In the third place, the new State Constitution allows no one except the Attorney-General to begin a suit against a person guilty of an election offense.[1] Mr. Herbert H. Ward, the present Attorney-General, is believed to have been Mr. Addicks's counsel for many years; and there seems to be a general feeling in the State that he will not take the initiative in legal proceedings against his client, unless the evidence laid before him is very strong. This may be a wholly mistaken impression, but taken in connection with the failures to convict in the Davis, Moore, and Reiman cases, and the risk of counter-prosecution by Mr. Addicks, with his counsel as Attorney-General and his millions for legal expenses, it has made both of the opposition parties cautious. My own opinion is that if there were in Delaware a man like Mr. Folk, of St. Louis, he would soon put an end to this daring law-breaker's Senatorial campaign. Throughout his political career in Delaware Mr. Addicks has acted in accordance with a declaration that he made to his second wife with regard to another and more personal matter: "I am a law unto myself; or lawless, if not the law!"

I have left myself room only for a very few remarks concerning Mr. Addicks's personal character as it appears in his political record. The first thing that strikes one, in reviewing the history of his long struggle for the Senatorship, is his weakness as a politician and manager. He is a bold and persistent fighter, an unscrupulous adversary, and a most adroit corrupter of men; but he is extremely imprudent, he is an extraordinarily reckless and foolish talker, and he seems to be wholly lacking in the ability to forecast the results of actions, or courses of procedure. As illustrations of his imprudence, take, for example, his attempts to get financial assistance from corporations and organizations outside of the State. At the beginning of one of his campaigns he went personally to a well-known manufacturer who is the President of a manufacturers' club in a large Northern city and said to him, in substance, "I want your club to put up $75,000 to help me in Delaware. If you'll put up $75,000 I'll put up another $75,000, and with the $150,000 I can buy up the whole Democratic party in the southern part of the State. Then, when I'm elected Senator, I can do a lot to help you manufacturers."

In another case, he made to the representative of a Pennsylvania steel company a somewhat similar proposition, and offered the remarkable suggestion that the United States Senatorship might be "syndicated." I have refrained from giving names in these cases, but I can

[1] "Every prosecution for any of the offenses mentioned in Section V. of this Article shall be on information filed by the Attorney-General." (State Constitution, Art. V., Sec. 8.)

furnish them should they be called for by competent authority.

Nobody but a man of extraordinary audacity and recklessness would have ventured to make such propositions and take the chance of being "given away." Dr. Layton, who is also a reckless talker, but who is shrewder, in many ways, than his candidate for the Senatorship, once said to a friend, in a moment of irritation, "Addicks is the worst fool outside of a lunatic asylum; but I'd support a Feejee from the Cannibal Islands if he had money enough to beat the Democrats!"

As an illustration of Mr. Addicks's lack of judgment and of political foresight, I need only refer to his action in persistently and pugnaciously forcing himself upon the Republican party in Delaware, when he saw clearly that he was not its choice for Senator. It is the judgment of the ablest of his opponents that if he had given way in 1894—if he had simply said, "Gentlemen, I see you don't want me, and it's all right. Put up your best man and I'll help elect him"—nothing could have prevented him from going to the Senate the next time there was a vacant seat. Instead of doing this, however, he became, as the Committee on Credentials said to the St. Louis Convention, "a highwayman on the road to political fortune," and proceeded forthwith to hold up the State.

[THE END]

The New Politician[1]

By Richard Watson Gilder

While others hedged, or silent lay,
He to the people spoke all day;
Aye, and he said precisely what
He thought; each time he touched the spot.
"In heaven's name, what does he mean!
Was ever such blind folly seen!"
The wag-beard politicians cried:
"Can no one stop the man?" they sighed.
"This 'talking frankly' may be fun,
But when have such mad tactics won?
He may be happy, but the cost
Is ours! The whole election's lost!"
And still the people at his feet
Followed and cheered from street to street.
Truly this ne'er was known before:
No soldier, sailor, orator,—
No hero home from battle he
Whom welcoming thousands rush to see;
But just a man who dared to take
His stand on justice, make or break;
'Twas all because the people found
A man by no conventions bound;
Who sought to heal their black disgrace
By treating rich and poor the same,
Giving to crime its ugly name,
Damning the guilty to their face.
And when the votes, at last, were read,
One candidate ran clear ahead!
This be his glory and renown:
He told the truth—and took the town.

[1] This poem, as the reader sees, is a tribute to District Attorney Jerome and his campaign. It is reprinted by permission from Mr. Gilder's "Poems and Inscriptions," published and copyrighted by the Century Company, of New York.

A FIGHT FOR THE CITY

THE STORY OF A CAMPAIGN OF AMATEURS

BY ALFRED HODDER

Private Secretary to District Attorney Jerome

VI.—Election Day—and After

ON the eve of election day the need that pressed most heaviiy was that of watchers at the polls. "We need watchers," Mr. Jerome had said four days earlier at The Acorns. "We need, not paid watchers; th y can't do the thing; they are not good for that sort of thing. You pay men and they usually turn up at the polls in a state that renders them by no means the most efficient persons for that purpose. Efficient watching at the polls is watching by American citizens, American citizens determined to see an honest count. Now for that there are needed many men; there are needed volunteers; and I wish that from this audience we might get to-night a lot of men to volunteer to that one day's work for the good cause upon election day." There were volunteers there and elsewhere, but fewer in the whole count than had been hoped; the number needed was the greater because of open menaces of intimidation and violence at the polls. There had been menaces of violence, for that matter, at every stage of the campaign; Mr. Jerome's morning mail had almost from the first abounded in warning letters, which the sage Henneberry, who opened them, quietly consigned to the waste-paper basket—a practice followed, by the way, in Mr. Jerome's office to this day. Mr. Jerome knew little and seemingly cared less about danger to himself; but his friends saw to it, without his knowledge or against his will, that he was seldom in the streets alone. His real safety lay, however, less in the companionship thus forced upon him than in the concern each district leader felt lest he himself be held to blame if violence came in his territory to the candidate. In the later days of the campaign, at large meetings held in districts in which the threat of assassination had been frequent, a squad of police was detailed, by no request of Mr. Jerome or of his friends, to meet him at his carriage and conduct him in safety to and from the platform. The threats of violence to the watchers at the polls were likelier to be carried into effect.

The District Attorney's office, as has been explained already, was more valuable to Tammany than the Mayor's—in particular than the Mayor's with no more strenuous partisan of Tammany than Mr. Shepard in the Mayor's chair. Orders had been given to trade Shepard votes for Jerome votes, and it had been openly declared that any man who wore a Jerome badge on election day should be put out of business. It had been planned accordingly that there should be at least two unpaid sturdy able-bodied watchers at every polling-booth on the East Side. When this was found impossible, word was sent to the watchers for the Fusionists at every polling-booth to telephone at once, in case of difficulty, to Mr. Jerome's headquarters for assistance. At headquarters there were in readiness four automobiles and about thirty armed men, sworn in the day before as deputies of the State Superintendent of Elections for New York City; there were also lawyers who had volunteered to accompany them and instruct them on the spot as to the extent and limits of their powers. The first call for relief came a little after seven in the morning, and the first automobile started. Its occupants found, when they had reached their destination, a badly frightened watcher and a group of ugly-looking roughs approaching, [illegible]d at sight

of them and wavered and dispersed. The automobiles were busy all day answering calls, but the first trip was typical of all the rest. In every case the roughs had come to intimidate; the men in the automobile had come to fight—with clubs and revolvers if necessary; and no fight came off. As it happened also, no man wearing a Jerome badge was assaulted. When the returns came in, Mr. Jerome was found to have been in one sense at least a drag upon his ticket. Fusionist votes outside the county of New York had been wasted by being cast for him in counties in which he was not a candidate, and in Richmond County a Fusionist candidate had been defeated because the votes that should have been cast for him were cast for Mr. Jerome. In his own county of Manhattan and The Bronx he led his ticket by some fourteen thousand votes. When the result was known, he was no longer on the scene. As the campaign drew to a close, he had been making, on an average, some six speeches a night in widely separated quarters of the city. When his own vote had been cast, he had flung himself into the first train leaving the city for his home in Connecticut. "If listening to speeches is as hard work as making them is," he said, "I'm sorry for the people of New York."

At home since that day he has remained, if home may be taken in so large a sense as to include the house at Lakeville, the house in Rutgers Street, the Criminal Courts Building, the circle, large enough yet rigidly defined, of municipal and State affairs that by the nature of his office have become his own. On few men has the habit of the platform taken so little hold. Seldom has so great a gift for moving multitudes of men been left so many years unused; still more rarely has it been allowed to fall into disuse when once its efficacy has been tried. Invitations and even entreaties to speak in public have poured in upon him from all sides and from all parts of the United States; those which he has accepted might be counted upon the fingers of one hand, and even those have been personal rather than political: one from his own college, Amherst, one from the Students' Political Club of Harvard, one from the Bar Association of Colorado, one from Mr Rockefeller's Bible Class, one from the Mayflower Society. "Not on your life," he said, when those around him had been urging his acceptance of an invitation of particular importance to him personally. "Not on your life. During the campaign there was some sense in talking; at present there is none. There is mere curiosity on the one side and self-advertisement on the other, and I will have nothing to do with either. I would rather work in my shop"—referring to the crowded machine-shop in the basement of his house at Lakeville, where he has installed a dynamo and works silently for hours. He was a diligent student in his youth and early manhood; he scarcely can be called a student now, though, after the manner of early risers, he has the habit of spending an hour or so among his books before office hours. He is in point of fact a man of action, not of words; he is a man of action who is incidentally possessed of a gift for effective and convincing speech, by which to all appearance he himself sets very little store. Even in private life few men have ever shown less impulse to unpack their heart in words. If to the readers of the daily papers this appear a paradox, it is to be remembered that there is a difference between the impulse to speak and the impulse to reply. Partly by impulse, even more by deliberate intention, Mr. Jerome answers every question about public matters within the range of his immediate knowledge to which the etiquette of office does not forbid him to reply. Reporters are to-day the questioners in chief; they may even in some sort be regarded as the official inquisitors in behalf of the public; and with reporters he has dealt and deals in an unprecedented way. He admits all alike, he sends for none; he deals impartially with friend and foe; he is so far from asking in advance what use they mean to make of the information furnished them that he does not even retrospectively inquire into the use of it that they have made. It is well known among reporters that he never corrects false versions of an interview, unless indeed another reporter chance to ask whether he has been quoted accurately. Fantastic versions of his sayings and supposititious interviews with him abound. One warning only has he ever given to curb invention and imagination in their flight. "Boys," he has been heard to

say to the reporters (the "boys" are for the most part some twenty in number, admitted all at once to interview him on such subjects as each may have in mind), "you may make me talk sheer nonsense if you will, and the chances are that I shall never know it, or call you to account; but if ever one of you should put a word into my mouth that brings my honor into question, and I know of it, by Heaven, I'll have him clapped behind the bars!"

He is given neither to self-explanation nor self defense, nor any form of exposition; despite his fund of anecdote, of repartee, of banter, of the current coin of sheer good fellowship, he is in graver matters of emotion and opinion reticent to the point of taciturnity: it is of statements of fact that he is liberal; it is his knowledge of plain, demonstrable fact that he keeps at every man's command. There is a sense, indeed, in which, for all his easiness of access and openness of speech, he is by no means an easy man to know. No man is easy to know who has so little impulse to seek advice or aid or counsel, so little impulse even to volunteer his counsel or his aid. He has confined himself to making it well understood that any one may turn to him who will, and to taking up his residence where those may turn to him most easily who are most likely to be in need of aid. Almost at the beginning of his term of office he established what is virtually a branch District Attorney's office, open in the evenings, in the heart of the East Side. The District Attorney's office is in a degree imperfectly estimated by the wealthier members of the public, who, when their own interests are in question, are accustomed to employ the services of private counsel. Its immediate function is no doubt, as it purports to be, the punishment of evil-doers upon evidence brought to its notice; but the punishment of evil-doers is intended for the protection of well-doers; to the innocent it is of prime importance to know what injuries are and what are not punishable by the criminal law. From the beginning to the end of the customary office hours, from 9 A.M., that is to say, to 6 P.M., men and women come to the District Attorney's office in the Criminal Courts Building to ascertain their rights—rights of parents and children, rights of wife and husband, rights of landlord and tenant, rights of employer and employee—and to invoke protection of their rights. The protection of their rights is by no means necessarily a matter of elaborate procedure; in a vast number of cases, whether the offender be a police official, or a neighbor, or a landlord, or even the Metropolitan Street Railway Company, the mere menace of a legal process serves to bring about redress. It is the poor, as has been said already, who are subject to the arbitrary power of the police; it is the poor who are exposed to every form of arbitrary power. On the other hand, the poor are, as a rule, at work during the ordinary office hours, and to many of them the imposing aspect of the Criminal Courts Building, and the number of officials necessarily encountered there, form an obstacle the more. The difficulties of this situation Mr. Jerome has met by making his home, at least for five days in the week, in a house on the East Side. He does not keep hours there—he is in the morning among the earliest at his post in the Criminal Courts Building, and could scarcely keep evening hours in Rutgers Street without renouncing all contact with the outer world; but he has representatives, selected from his staff, who do keep evening hours there, and, when he is at home, is himself, in case of need, always to be seen. Characteristically, here again there has been no finger lifted on his part to compel men to come in. He has done as little to invite or to cajole his poorer neighbors to his door as he would have done had he been living among men more prosperous than himself. "This is no charity," he said to an English visitor a little while ago, "and no University Extension Settlement; if anybody thinks that I can tell him anything he wants to know, I'm glad to tell him; if anybody thinks that I can help him, I'm glad to help him; if no one does, I'm living here exactly as I should be living in any other house: I find my days only too full."

His days are full, self-evidently, of the business that belongs to the District Attorney's office as a whole: business by no means for the most part of a kind to catch the public eye. In the members of the District Attorney's staff integrity is of more importance than in the officials

of a bank. Dishonesty in the manipulations of accounts or funds is sure to be discovered sooner or later; in a bank there is no action not of record and no record not scrutinized by many eyes. In the District Attorney's office there are lawyers any one of whom may and must not seldom, in his single person and in private conference with single persons, represent the Chief. The supervision by the Chief of every stage in the conduct of every case is necessarily a legal fiction; it rests in the power of the assistant to find the evidence for an indictment sufficient or insufficient, to reject and accept witnesses, to heighten or make insignificant their testimony, to procure adjournments, even to manipulate the stock market by undertaking sensational investigations, sure to be dismissed, but sure in the meantime to make fluctuations in the market to the profit of the investigator of those who find it worth their while to share with him their gains. With little danger of detection an assistant in the District Attorney's office may, by association with grafters, or by single-handed grafting, compass sums far greater than his modest annual pay; the only danger he need incur is that of rumor and suspicion. There are men in Mr. Jerome's office who heartily dislike one another; there are men in Mr. Jerome's office who are heartily disliked by many of the public who have had to do with them; both inside the office and outside there are current words of dispraise for this, that, and the other member of the staff; *but* none of the words of dispraise point to dishonesty; the office is free from even the suspicion of graft. Curiously enough, and in a way significant enough for the earlier history of the office, their honesty has sometimes proved for the time being to the honest man himself an obstacle. It is by no means only for illegal services that the clients of the office come prepared to pay illegal fees. To the house in Rutgers Street there come at present on legal business from ten to forty nightly visitors, but in the beginning men came hesitatingly and with little confidence; there was small faith in services to be obtained where there was nothing paid. Among the clients in the Criminal Courts Building the feeling is too frequently the

A poor woman came some time ago to one of Mr. Jerome's assistants to seek aid in finding her daughter, a girl of fifteen, who had been decoyed into a house of prostitution. The woman herself made fifty cents a day by sewing; when she had told her story to the end, she laid on the table a ten-dollar bill. The assistant shook his head; she took it back and left the room in a violent burst of tears. The daughter was found promptly and restored to her; and the next day the mother came, all gratitude and smiles, to thank the assistant for his pains. "Oh, sir," she said, "when you wouldn't take my money, I was sure you wouldn't do anything at all." At about the same time a man came to another of Mr. Jerome's assistants to offer himself as a bondsman. His property was sufficient, and the assistant was on the point of giving his approval, when the bondsman in his turn laid on the table a bank-note. "Take up your money," said the assistant. "What for?" asked the bondsman. "Because I am going to kick you out of the office, and I don't want you coming back after your coin," said the assistant; and he literally, and with enthusiasm, kicked him out. It is impossible, no doubt, to censure the assistant. Yet to the dispassionate spectator there might well have been permissible a certain sympathy even for the bondsman; under the only system that he knew, he had no cheaper or more legal means of coming by his rights.

In the Tammany ranks there prevailed certain humorous versions of the changes brought to pass in the office of the District Attorney; one *bon mot* of a Tammany man is current in the office at the present time. "Sure an' the present Disthrict Attorrney's office is possessed of the divil, I dinnaw. In the days that was, whin a man had big throuble, he had but to go to an assistant an' say, 'Good-mornin' kindly, sorr; it's a frind of Tim's I am, and he is sure ye'll find it aisy to give me this little adjourrnmint.' Whin ye meet up with your little assistant forninst ye now, ye have to crrook yer knees, an' wave yer arrums, beatin' toime, yer hat in wan hand the whoile, an' yell—'Rah, rah, rah! Rah, rah, rah! *Har*-varrd! *Har*-varrd! *Now* will ye be good?'" Only a minority of the members of the office are, in fact, graduates of Harvard College, but

all are college men. In so deciding it may reasonably be supposed that Mr. Jerome was influenced not only, and even perhaps not mainly, by the traditional position of the law among the learned professions; there have been men enough who without academic learning have been eminent in the law. But for men not bred in college there has, for the most part, come too early a dividing of the ways; they have used their brains and their brains only, or they have used their bodies and their bodies only; if they have used their brains, they have too seldom been partakers of the discipline that makes the body fit for use and the spirit unafraid. The District Attorney's staff is, under its peaceable exterior, essentially a body militant, existing to make war upon the lawless portion of society; when, instead, it enters into an alliance with its natural adversaries, it has, of course, less need of the military and athletic virtues; when it pursues them home, it has to do with reckless and intimidating foes. The college-bred man of at least the last few decades in America may be trusted under menace of force to hold his own. It is not simply that, in the Criminal Courts Building, where so many suspected criminals, ex-convicts, and friends of criminals have errands, there are necessarily armed men on every floor and in every audience-room; it is also that whoever is to be employed on cases touching the gambling interest is sure to find in growing numbers letters threatening assassination in his mail. Assassination is in the United States not frequent; it would be an error to take such letters seriously. It would be an error also wholly to ignore them; among gamblers, for example, the tradition of revenge is of long date and strong; and in the slums are men, sufficiently well known to criminals of higher rank, who for a matter of some dollars will undertake to "do for" any man. The risks are such as reasonably may be reckoned slight by the cool bystander at the game; they are enough to cause a timorous man concerned so much unrest that to avoid them he will leave his duty half undone. At the present writing reporters are in person or by telephone besieging the house in Rutgers Street for confirmation or denial of reiterated reports of the assassination of Mr. Jerome.

Honesty beyond suspicion and habitual hardihood of mind and body characterize the staff that Mr. Jerome has brought together; these, and swift despatch of work. The first measures taken by Mr. Jerome were measures to abridge the law's delay. Cases of homicide have, by a member of his staff, been investigated directly upon the commission of the crime, when evidence can be obtained with facility, and have been brought to trial, if possible, at once. The first murder after Mr. Jerome took office occurred one Friday; the defendant was indicted on the following Monday, and two days later had been tried and sentenced and had begun to serve his term. When Mr. Jerome took office, there were 861 criminal cases in arrears; during the next twelve months the Grand Jury found 3,890 indictments; at the close of the year there were but 450 criminal cases outstanding. Those who know anything of the rate at which cases are disposed of in a private law office will understand how unremittingly the members of his staff have worked. It is only fair to note that the achievement of the year preceding, thus surpassed, itself had broken a record. Whatever may have been, under Mr. Jerome's predecessor, Mr. Philbin, the shortcomings of the District Attorney's office, there had already been effected by him no inconsiderable reform. Mr. Jerome had in his early manhood been a member of the District Attorney's office, and in one of his speeches incidentally recurred to the impression he received: "The District Attorney's office of the County of New York," he said, "was in those days the mouth of hell."

In the inner circle of the office and its business the success achieved has been complete and manifest. In the outer circle of affairs in which the office plays a part more striking to the imagination of the public but less independent there has as obviously been achieved a less unqualified success. No reasonable partisan of the reform administration could claim that the reign of blackmail has been ended or that the abettors of the systematic violation of the Sunday liquor law, the gambling law, the prostitution law, have been held to strict account. To the hasty reader of the journals of to-day who has forgotten the journals of last year, Mr.

Jerome may seem to bear his share in this failure of the programme of reform; in reality it is a striking demonstration of his insight into fact. His programme was the alteration of the laws, and there has been no alteration of the laws. In the possibility of the honorable discharge of duty by particular officials even in the existing circumstances he has believed devoutly; but never in general cessation of perjury and blackmail underneath the sway of the administrative lie.

In the year that has just closed there have been in municipal politics two points of singular interest to the dispassionate observer: the acknowledged success of William Devery, the acknowledged unsuccess of the party of reform. William Devery was at the outset, as is known, excluded from his party: if Tammany has never learned to use the administrative lie with as much gravity and unction as its adversaries, Tammany at least has never ventured to dispense with decorative words. William Devery is no doubt as well content as Tammany to keep lying laws upon the statute-book: he is to all appearances indisposed for his own part to deal in lying words. Precisely as in his capacity of potentate he had made no secret of his principles of government, so as a candidate he set no gloss on his own motives or on those to which he made appeal. He began his canvass for the leadership of his own district ("de Nint'") by scattering coin among street urchins and opening stands for the free distribution of ice (it was high summer) without investigation of the politics of the applicant or of his needs. "We've got Mr. Goodwin and Mr. Sheehan in this district," he said in a speech, naming his rivals. "What's either of them ever done for it? Do you know there ain't a small park or a public bath or a recreation pier in all the district? Well, there ain't; and the Legislature passed a law for a small park over here between Twenty-seventh and Twenty-eighth Streets. Sheehan had his chance to get it and he hasn't taken it. There's a park up in Plunkett's district and another down in the Seventh, but there ain't none here. That's the kind of leaders them fellows are. An' who have they given any work to? Why, I see young men standin' round the Pequod Club with their hands in their pockets doin' nothin'. They're doin' nothin' because there's nothin' doin'. After six months in power, Goodwin has had a chance to put horses an' carts an' men to work on street openings, but he hasn't done it. An' Sheehan! Did Sheehan ever give any man employment on his Second Avenue contract? No, he didn't. Now, I say I'm here for you young men. I'm with you and you're with me. Whatever I can do for you I'll do. You're working for yourselves an' me: I'm working for you—an' for myself."

There was a principle of kindness there, even though of interested kindness; there was a principle of team-play, even though of team-play of the baser sort; and the kindness tried to pass for no whit more unselfish and the team-play for no whit nobler than it was. In that last point lies the difference between Mr. Devery and other Tammany men of note. Their kindness has been in essentials of the same sort as his; they have won men's hearts by kindness and by team-play; they have thought to win them more securely still by decorative words. More accurately, they have feared to lose them if they failed in supplying decorative words. They have taken for granted the old Anglo-Saxon duality of instinct with regard to facts and words; they have tried with unpersuasive decorative words to satisfy those separate instincts separately. Meantime it has been shown that in at least a portion of the public no such duality exists. It would be a mistake, as has been said already, to suppose that Mr. Devery incurred the indignation of the public by his deeds; his deeds were of a kind already sufficiently familiar: he incurred it by his words. It would be in like manner a mistake to suppose that he aroused the enthusiasm of the public by his deeds or by his promises and sentiments; deeds, promises, and sentiments were of a kind sufficiently familiar: he aroused enthusiasm by his words. It is the fashion to regard his popularity as evidence of mere acquiescence in corruption; it may more reasonably be regarded as evidence, in at least a portion of the public, of a growing weariness of decorative words, in growing hunger for words that square with deeds.

The average reformer is to the utmost as lacking in brutal sincerity—is at the

least as much under the domination of the decorative phrase—as the Tammany politician; and is in addition lacking in kindness, even in interested kindness, and lacking in team-play, whether base or noble. Of lack of kindness, of decent gratitude, no better instance could be given than that of Officer O'Neill. In himself O'Neill was a figure justly of small importance; he was a patrolman, an honest one, in the metropolitan police. But he was also a veteran soldier honorably discharged; brought before Mr. Devery in one of the court sittings at Police Headquarters that the New York "Sun" delighted to report, he openly defied his judge—the "Big Chief;" he said openly, as no man before him had dared to say, that he was fined thirty days' pay because he would not stand for a "shakedown," which means that he refused to give from time to time on demand five or ten dollars out of his meager salary to his superiors, to be used for purposes unknown; and for his freedom of speech in contempt of court he was "broken"—dismissed from the force, and deprived of his chance for a pension. The reformers made of O'Neill something little short of a hero; they took him up; they used him; in private they celebrated him and made to one another vague promises of taking care of him; in public, from every platform, they made much during the campaign of his sterling pluck and audacity; they even introduced him before great mass-meetings to make speeches in behalf of the Fusion candidate. His speeches were a narrative of what he knew of the police under Devery, a narrative modestly and earnestly told; they were effective and well received; the Fusion candidates were voluble in praise of O'Neill; in a gratitude sincere at the time, they said to one another, and no doubt each to himself, that O'Neill must not stand to lose by the help he had given them; that if they should win out—that whether they won out or not—they must make a point of caring for O'Neill, and if possible of reinstating him on the force. As every one knows, they won out, on election day, on the sixth of November. When they went into office two months later, O'Neill was practically destitute, certainly in distress. What appeals for help he made—whether or not he made any appeal—I do not know. What I do know is that during those months his pluck was much talked of and his necessities unrelieved. When, upon taking office, the reform candidates were apprised of O'Neill's distress, there occurred by telephone a number of consultations in regard to him. For the time being, as a makeshift until justice could be done him, Mr. Jerome, in sheer impatience of the prolixity of consultation, gave O'Neill a position as process-server. The reform office-holders have now been in power a year and more; O'Neill is still in Mr. Jerome's employ as a process-server; he will lose that position when Mr. Jerome goes out of office; he has not been reinstated on the police force; he has not been reinstated in his right for faithful service to a pension.

The reformer has thus far been too much inclined to pique himself upon the sins which he does not commit and even upon the kindnesses he does not do. The promotion of the interests of individuals is, in his thoughts, vaguely associated with corruption; there is latent in his mind the formula that he is working in the service, not of individuals, but of ideas. But except by serving individuals there can plainly be no effectual serving of ideas. The grafter provides opportunities for graft for the men who have helped him; the honest worker provides opportunities for honest work for the men who have helped him; or, if he does not, so much the worse for him and for the party to which he happens to belong. So much the worse also for the honest work that needs to be performed. The party of reform is, in theory at least, the party of honesty, efficiency, and energy in public business and in all the industry and commerce of the land. The choice of honest, energetic, and efficient men needs a discerning eye. The Tammany leader, as a rule, has a discerning eye. He knows how to select and to promote men efficient for his purposes; men efficient for his purposes are not necessarily or usually the men efficient for the purposes of the party of reform. On the one side, one kind of efficiency to be distinguished and fostered and rewarded; on the other side, another kind. There lies the whole vast difference between a party of corruption and a party of reform. But what shall be said of the future of a party that is not

bent upon distinguishing and fostering and rewarding efficiency of any kind?

It is too commonly forgotten, even by reformers, that the party of reform differs from the Republican party, for instance, or the Democratic, in a fashion that makes mutual aid a matter not of less but of greater obligation. It is professedly a party of efficiency and honesty. A man may be in opinion the sincerest of Republicans or Democrats and yet be unfit for employment or advancement; but who is fitter for employment or advancement than the honest and efficient man? Far from finding himself exceptionally friendless, as at present, a useful member of a party of reform should find himself exceptionally well befriended; the party of reform is by profession unpolitical, undoctrinal: it is or ought to be a class—the class of the honest and the strong. The strength of a class, when all is said, is simply the strength of all its members; it has, or ought to have, for end the strengthening of the honest and the strong.

In point of fact, the party of reform bears scarcely the least resemblance to a class. The lack of team-play visible in the relations of the leaders to their followers is still more manifest in the relations of the leaders to one another. They have in common, seemingly, only negatives; there are men with whom they will not act; there are deeds they will not do. There is nothing, seemingly, that with one mind and in one way they are resolved to do.

The typical Tammany politician has long since learned to subordinate himself in team-play. The typical Tammany politician is not, in the jargon of the stage, a star performer; he is a professional; he can do his bit and do it well; but he is a member of a company; he is non-existent on the stage except as a portion of a whole. The typical reformer is a star, and a typical reform administration is usually a company of stars. Mr. Low is a star, Mr. Grout is a star. Two-thirds of the professional reformers who voted for them are stars; each one too excellent in his own kind to subordinate himself to team-play.

It may be alleged, indeed, that Mr. Jerome, like other eminent reformers, is a star, unwilling to subordinate himself in team-play; but the assertion will not bear examination. The only plan of action, apart from mere honesty in office, formulated by any speaker during the reform campaign was his for the reformation of the lying laws upon the statute-book; and neither he nor his associates proposed that plan in public until he had first submitted it to Mr. Low as the official leader of the Fusion movement and entreated him to adopt it as his own. When Mr. Low, in his opening speech at Cooper Union, reached the question of the Sunday liquor law and its enforcement, he did not explicitly adopt Mr. Jerome's way of dealing with it as his own, but he adopted it, to all appearances, implicitly; "Mr. Jerome," he said, "will speak of that." Mr. Jerome, in Mr. Low's presence, not once only but many times, assured his auditors that while he spoke, like other men, for himself only, he relied upon his colleagues' entire concurrence and support; and Mr. Low, among the others present on the platform, took active part in the applause. If the plan of action Mr. Jerome put forth was beyond question his own in its inception, it was at least put forth by him when, on good grounds and in good faith, it could be treated as a party plan; if since his election he has steadily adhered to it with or without the assent of his associates, there can be no doubt that he himself stands pledged, whoever else is free. And it would be difficult to say what other plan of action can be regarded as the party plan. The plan of liberal enforcement is by no means a plan of action; it is a plan simply of negation and inaction: negation of the effort to enforce the law, negation of the effort to amend the law; negation of reform itself, since by no interpretation can the purpose of reform be a prolongation of the *status quo*.

The system of liberal enforcement is, of course, literally and precisely the system of the administrative lie. Mr. Jerome's political activity has been from first to last one unflinching campaign against the administrative lie. If he has succeeded, if he still succeeds, in making the overthrow of the administrative lie the standing policy of the party of reform, his success will mark a transformation of the party from within—its transformation from a party of good words and good report into a party of good deeds. The

assault upon the administrative lie will have been organized in one of the main strongholds of the administrative lie. One of the main strongholds of the administrative lie, as has been said already, is the sheltered woman's world. The world of the reformer hitherto has borne a certain resemblance to the sheltered woman's world; it has been a world of sheltered men. The typical reformer has been delicately bred and miscellaneously educated after a scheme of education that takes cognizance of little except ideas and words. He has small notion of a world of strife in which men's safety depends on mutual loyalty, on action, energy, and cognizance of fact; in the woman's way, he piques himself on what he is and what he likes. He has the woman's talent for words; he piques himself on purity, he piques himself on taste. He piques himself not least, it seems, on being easy to shock and on reposing perfect faith in decorative words. He does no doubt in many instances repose implicit faith in decorative words; like the woman, for sheer lack of daily contact with rude fact, he is in many instances the natural dupe of the administrative lie.

If among the members of the Continental nations Anglo-Saxon hypocrisy has been almost a by-word, that is because such honest and unconscious inconsistency is to them incredible, impossible; they find in their own nature no such lack of unity; they are veracious or mendacious knowingly; they do not deal with life and with the world piecemeal. In the American there is an even more various intermixture of racial elements than in the Englishman, but it is not always the subtraction of an element that makes for greater unity or the addition of an element that makes for more admired disorder; there is such a thing as the addition of new elements with unifying and crystallizing power. In the American the blood of English men is blent with that of men far less at variance with themselves. In the American, accordingly, the most superficial observer may discern a greater love of symmetry, precision, order; he goes to Germany for precision and consistency in scholarship; to France for precision and consistency in art; in literature, in thought, in art, he shows an almost Gallic sense for form.

The modern American is, in a sense, an Anglo-Saxon, but an Anglo-Saxon with a difference; and that difference makes against the maintenance of the Anglo-Saxon administrative lie. To men born with a turn for unity, consistency, precision, logic, order, it is not given to lie unconsciously and honestly. It was because the Anglo-Saxon of the parent stock lied honestly and unconsciously that he lied thrillingly; it was because he lied unconsciously and honestly that he retained the vigor of the honest man. The administrative lie known as a lie is no longer the Anglo-Saxon administrative lie; it becomes instead what may be called for brevity the Latin administrative lie; it begets cynicism; it begets effrontery; it begets sheer recklessness of fact. It is not likely that Americans will in the long run acquiesce either in cynicism or in disregard of fact. They are not sentimentalists; they are not cynics; alone perhaps among the nations of the modern world they unite the instinct for consistency, which is essentially an instinct for ideas, with an instinct for stubborn loyalty to fact.

The instinct for consistency has often been regarded as a source of danger in the world of practice; but it is a source of danger obviously only in so far as it entails a lack of sense for fact. The sense for fact itself has often been regarded as a danger in the world of practice, on the ground that it makes naturally for cynicism and disregard of moral law; but values moral and emotional themselves are part of fact; sentimentalism and cynicism alike are signs of lack of sense for fact. It is part of Mr. Jerome's power, it is part of the cumulative evidence of the likelihood of his success in the long strife in which at first he stood apparently alone, that he himself is so typical an American of the new time. By his very name he stands revealed as an Anglo-Saxon with a difference—an Anglo-Saxon with a Gallic clearness and unity of mind. After the manner of his countrymen of the graver sort, he placed his instinct for consistency at first at the service of the puritanic formula; he put his trust in the administrative lie, he sought to make a truth of the administrative lie. It is in very young men in some sort a sign of grace to give implicit credence to good

words; they have had no time to master the mute facts of the world. In the school of puritanism he won the right to deal without reproach with the main evils misdealt with by mendacious laws; in the school of puritanism he kept his fire of moral zeal and wrath alight. He is a man of the world with a capacity for moral indignation; he is a puritan without illusions; he is an idealist whose dominant idea has come to be fidelity to fact. He is a speaker of extraordinary effectiveness, the secret of whose effectiveness lies seemingly in sheer indifference to effect. He is a statesman whose effectiveness results from the simplicity, centrality, and self-evidence of his ideas, and from the singular union in his pursuit of them (a union not, indeed, infrequent in his countrymen, but nearly unexampled outside the circle of his countrymen) of nonchalance and zeal. He has never yet to any onlooker seemed eager or restless in enforced inaction; he has never yet in any opportunity for action been found to have grown cold. To men of such a temper in the United States adherents sooner or later come; to one or the other logical alternative in matters of public policy adherents sooner or later come. For men of clouded vision or divided mind there are many lines of policy conceivable with regard to the administrative lie, since there are many intermixtures possible of falsity and truth; for men of lucid vision and unity of mind, for plain-dealers, there are only two lines of policy conceivable: decorative public speech consistently denied in private and in administrative word and act—the policy of, say, Senator Platt; honest public speech consistently made good in private and administrative word and act—a cynical avowal of the worst practice of the time, or a fearless avowal of the best, and a fearless refusal to avow more than the best, that is practical at the time—the policy of William Devery or the policy of William Travers Jerome.

There are signs already that the alternatives are beginning to be recognized; there were signs already that at what was outwardly the close of Mr. Jerome's campaign the public far and near was vaguely aware that his campaign was only just begun. The excitement of the canvass round about his path has never quite died down. From every part of the United States his mail still brings letters of approval or requests that he should intervene where right of intervention he has none. Unknown men of business, unknown workingmen, still stop him in the streets to shake his hand; diners in restaurants where he is seen are likely still to raise cheers for Jerome. The evidences of enthusiasm are far from being balanced by evidences of hostility; the evidences of hostility from first to last have been singularly few. He has opponents, naturally, and vehement opponents; he may even have assassins; but it is palpable to the attentive onlooker that for a man so open in denunciation he has roused extraordinarily little honest hate. In the Republican party and in the Democratic, in the camp of the Reformers and in Tammany, there are forces fighting on his side. He himself knows well that his fight is only just begun. "I do not know whether I shall win my fight," he said only a few days since to a reporter; "but the fight is a good fight; I mean to fight it to the end."

[CONCLUDED]

From the Philippines

The following comes from a correspondent in the Philippines who has special facilities for accurate and trustworthy information, and in whose judgment concerning the conditions in those islands our readers can place implicit confidence.—THE EDITORS.

WE are moving along and progressing slowly, and looking forward with some degree of fear to possible suffering from short food supply in May, June, and July, but with the profoundest hope that Congress will see fit to aid us by giving us sound money, a non-fluctuating medium, and reducing the tariff to twenty-five per cent. The most pressing necessity now upon us is that of buying and bringing cattle here to sell to the people who are able to buy. This will require a large amount of money, more perhaps than can be appropriated here, in view of the diminishing surplus. Should Congress in its generosity, with an overflowing treasury, appropriate two or three millions of dollars to enable us to

buy the cattle and stock the farms, it would not very much reduce the fund after the work had been completed, and Congress might provide in the gift that after it had accomplished the purpose of restocking the farms, the fund remaining should be devoted to the foundation of an English university. Nothing could so well teach these people the intense interest that the American people have in them and their welfare.

The need of an English university here is crying, and we shall have to establish it ourselves, though we have most limited funds with which to begin. It is the keystone of the educational arch. We are bound first to educate the sons of educated people, and the leaders of what public opinion there is in the Philippines, in English and American institutions. Unless we give them an opportunity to graduate at an English-speaking university, they will prefer to go to the Spanish schools, and to avoid the public schools, because they can graduate at the Catholic University of St. Thomas. The establishment of a university here will give a tremendous impetus to the desire to learn English, which is already great, but which of course, as the difficulties of learning the language become appreciated to these not very persistent people, will have a tendency to fade away. The change which has been made in the educational department I think is a good one.

We have now a Roman Catholic at the head of the Department of Public Instruction, with a competent man, Dr. Bryan, at the head of the Bureau of Education. The real executive, of course, is the Superintendent of the Bureau of Education, Dr. Bryan, but Judge Smith is in such a position of control that he can see to it that the public school system is not rendered hostile to any religion.

In church matters the situation seems to have changed considerably. The opposition to the friars among the people is very great, and Aglipai, seizing upon the refusal of the Church to agree to exclude the friars from these islands, has been able to secure the active assistance of a great many Filipinos, and the more or less latent sympathy of all of them, in his movement for an independent church. The respectable Filipinos generally do not separate themselves from the Roman Church, but they are all waiting to see what the real attitude of the Apostolic Delegate is to be, and unless it is quite radical the Church of Rome will have a long controversy upon its hands with the Independent Filipino Church. Aglipai professes, and so far as I can see sincerely professes, complete accord with the principles of the American Government and recognizes its sovereignty. The unusual opportunity to oppose the Church openly, to hold a mass without interference by the friars or the hierarchy, has done much to convince these people that the freedom promised and guaranteed by the American Government is real. Of course the great difficulty is the constant conflict over the right to control the churches and conventos. It was always claimed by some towns that the town owned the church and the convento, and merely held them for the use of the Roman Catholic Church, subject, however, to the disposition of the town when it chose; and now, as whole towns, or at least a majority of the people, including the former Roman Catholic priest, desert the Roman Catholic Church and go over to the Filipino Catholic Church, the priest at once transfers the church to Aglipai and holds mass therein for Aglipai. The Archbishop then sends another priest to take possession for the Roman Catholic Church, and the question is, What is the duty of the executive? Even if the executive believes the title to be in the Roman Catholic Church—and it was in the constructive possession of the Archbishop—can the executive go to the extent of using the executive arm, without any resort to the courts, to put out the apostate priest and put in the agent of the Archbishop? That question has been submitted to Washington and to our Attorney-General here, but no answer has as yet been received. Aglipai is not a great man; he had the reputation of being very cruel as the agent of insurgent forces in Ilocos Norte; he is a good deal of a plotter, and certainly has exercised a good deal of control over the native clergy. But Governors who come from Ilocos Sur, Ilocos Norte, Abra, and La Union report that the whole people there are with the new movement in the Church in favor of Aglipai and against Rome. Aglipai has been working in Cavite, and has succeeded quite well. He goes to the

Visayas for the next month, and the people are making great preparations to receive him there. The establishment of a church under priests of the character of Aglipai and his fellow-schismatics will not be in the interest of good morals and religious betterment of these islands, because the native priests, by the malicious neglect of the friars, have never been well selected nor well educated; but as a protest the significance of the movement cannot be exaggerated. In the end the Roman Church will probably win. The Roman Church is not infallible, certainly, but it does have a capacity for remedying its mistakes, which no doubt it will ultimately display in these islands.

There has been for the last two weeks a convention of the Governors of the islands in preliminary preparation for the taking of the census, and the Government has availed itself of their presence for the purpose of having general discussions with them. They have been very hospitably received and much entertained, and return to their posts with a feeling of their own importance and with a renewed allegiance to the Government that cannot but be useful. The whole work of the Government here in one sense is directed to convincing these people of the good intentions of the Americans in their work here, and anything which plants confidence in the minds of the people makes for its success. The Governors are men of much influence in their provinces, and through them the Government may fairly expect to find a good way of reaching the people.

Ladronism continues, but reports show that the constabulary is doing good work, and that, while it is rather a slow process, improvement is being made and there is no retrogression. The courts are working, and ladrones are being convicted in every province and sent for long terms to prison. This course, though it is not so spectacular as suppression by the military, is in the end much more effective. Singularly enough, the two worst provinces in the islands probably are Cavite and Rizal, in the immediate neighborhood of Manila. That is because most of the wickedness in the islands gathers in Manila, and the city offers a very good refuge for ladrones who are hunted, and because it also offers a very good place for the disposition of stolen goods. A native Governor of Rizal has been recently removed, and another, who is doing very efficient work, substituted.

The agricultural depression is of course the main difficulty here, and that can be overcome only by time, and possibly a period of two or three years. Politically there are one or two groups of irreconcilables who are anxious to make such trouble as they can by keeping within the law of treason and sedition and yet advocating all the principles of the insurrection. I do not think that their influence or their importance will be as great as they think it will be. Every three months indicates progress. The islands are much freer from disturbance now than they were three months ago. The longer we keep progressing in this way, the greater assurance it is to the decent people of the country that Americans are here to stay and that the Government is worthy of their support.

Manila, P. I., December 26, 1902.

A Country Church Industrial

By Mary Caroline Crawford

A CURE for the disease called hill-town degeneration has been prescribed by the present minister of a Unitarian church in Massachusetts. He believes that the cure is simply to get back to the combination of agriculture and industry from which the small towns have lapsed. He is trying, therefore, to bring home to the consciousness of Massachusetts farmers that gospel which Prince Kropotkin has so thrillingly preached. "Back to the land!" cries our Prophet of Montague, Massachusetts. But he adds, "Let us also spiritualize the country and revive the ancient industries." Born in Salem, New Hampshire, perhaps thirty-five years ago, on a farm over which his father, a lay evangelist, was the presiding genius, the boy drank in almost with his mother's milk the inspiration to cultivate at once the ground and Christian character. Always he desired to be a preacher, yet always he felt himself close to the soil, and was convinced that the soil had a mission

and a message for Americans. After leaving college, therefore, he set himself right manfully to the task of building up his Country Church Industrial, a church that touches all life and "makes the dead bones leap."

Mr. Pressey is enough of a journalist—he served a long apprenticeship at this trade—firmly to believe in the efficacy of happy nomenclature. He calls himself Bernard Secundus, Explorer, and his community New Clairvaux. The title as applied to him is, however, far from being a meaningless appellation. St. Bernard civilized Europe by preaching the combination of work and study. Through his monastery settlements he brought the Middle Ages out of barbarism. Every art and craft of the time, including farming, he improved and developed, and his gospel of work and worship did more than that of any other single individual for the advancement of civilization in Europe. It is just this gospel that Mr. Pressey is preaching, and just this work that he is succeeding most encouragingly in doing in Montague.

The visitor who, after infinite difficulty in the matter of train connection, really arrives at Montague, finds an exceedingly pretty little village. An electric car from Turner's Falls passes the station about once an hour, and if one is so fortunate as to connect with this, one's journey to the village proper is immensely simplified. But the only other mode of conveyance is a wagon stage which brings up the mail once or twice a day. It was this that I sought out.

"Do you know where Mr. Pressey lives, and can you take me there?" was asked of the tall, lean country boy who was in charge of the mail-bag.

"Yes, indeed," he answered. "Get right in."

And then followed the jolting journey of perhaps a long mile, past pretty white houses set back on trim green lawns, past the two churches of the place, and the two imposing industries. One of these was the veterinary's establishment, with prices for clipping and caring for horses nicely painted over the entrance; the other, a flourishing laboratory, where various toilet preparations are compounded. One or two shops, too, were observed along the way, as well as a quaintly rambling old building labeled Montague Tavern. Then the creaking stage brought up with a round turn in front of the Pressey parsonage.

Without and within, this is as pleasant a home as one could find in a long day's search. The keynote of the household is struck very promptly. As one enters the front door the legend "My Father worketh hitherto, and I work," meets the eye. And in truth there are no drones in this hive.

Besides Mrs. Pressey, a charming woman, whose father was as ardent an advocate as is her husband of social ideals, and the little daughter of the household, there are just now in the family a housekeeper, a compositor, a boarding pupil and apprentice, besides other casual members and employees, which make the number under the roof eleven.

This family group idea is an essential part of Mr. Pressey's scheme. Each family is, however, limited to twelve persons, and the work has already progressed so far that a farming family is now being started at the New Clairvaux farm-house, and a woodworking family will very soon be organized. Every form of labor is dignified, and here, as at Brook Farm, there is good talk, whatever work may be under way.

At the family dinner the table covering was of spotless white oilcloth, and the food simple but very good, with a plentiful allowance of Graham bread, which again brought Brook Farm keenly to one's mind.

Among those there were college-bred men and women, endowed with a sense of humor as well as with many good, sound, every-day qualities. The talk ran lightly from ping-pong to Carlyle, with here a funny story and there a sparkling epigram.

Dinner over, the second St. Bernard adjourned with the present writer to the library, while the apprentices went, after due rest, back to their work in the printing and magazine offices. This magazine is one of the most interesting of Mr. Pressey's industries. It was started for the sake of voicing his socialistic views and providing work for his young people. It records the progress of the handicrafts, exploits the ideals upon which New Clairvaux is founded, and preserves in its pages the

invaluable hill-town traditions which have for years been falling into the hands of its editor.

A hint of its quality may be had by quoting some of its editorial squibs. After acknowledging books and money received during the month, it says:

"Further, we get very much good advice, stimulating criticism, and inspiring praise from sources too numerous to mention; also some bad advice from distinguished public factors.

"God shield me and keep me from kindness—of the soft, molluscous, maudlin sort, I mean—the bright, phosphorescent soft-rot of selfishness. Heaven give the kindness that dares something; that lives not to please nor kills from cover, whose dealings are rather yea and nay; that praises from principle and truth, not policy; that condemns like a man who dares face his own convictions, but misses no opportunity for real service to others and to the public. If I am willing to bear a low estimation of myself and not be a coward when I do the unappreciated, necessary thing; if I am willing to live on little and work hard and take time; then with any low ideal or false practicability I need not compromise a hair's breadth. I am responsible for what I see, especially if nobody else sees it.

"The policy of this magazine is to lay down a definite ideal programme for human society, while banging away at the evils and lifeless things in the old programme; to foster the handicrafts movement for country places; to give currency to a body of rapidly perishing and invaluable hill-town traditions which have fallen to our keeping; to voice the specific work of New Clairvaux, to spiritualize industry —*and these five are one.*"

The little building behind the parsonage in which the magazine is published is as curious and as interesting as is everything else about this movement. It was originally a doctor's office, and a large case full of old leather-bound medical works, as well as the faithful skeleton, still remains in evidence. A facsimile of the Declaration of Independence is also there, together with a picture of Edward Everett Hale, one of Tolstoï at work, one of Booker Washington, of Ruskin, of Hugo, and of William Morris.

"Tolstoï, Ruskin, and William Morris are our three patron saints," remarked Mr. Pressey.

The only other thing of significance on the wall—and this seemed to be to the visitor of decided interest, hanging there where the country boys and girls of Montague might observe it—was the Latin document insuring to Edward P. Pressey all the rights, privileges, and opportunities of a Bachelor of Arts of Harvard University.

The printing-office and the composing-room are parts of the parsonage itself, and nearly every corner in the house has a desk devoted to some particular department of the work. The printing is extraordinarily well done, for Mr. Pressey invested in a lot of good type, and had the ingenuity and fortune to connect his press with a little stream that runs behind the house, thus securing water-power enough to manipulate his plant. Pamphlets, circulars, posters, and letterheads are printed in large numbers at this little establishment, as well as two magazines—Mr. Pressey's and one edited by Dr. Dresser, of Boston.

Besides the printing, raphia basket work, embroidery, lace-making, cabinet-making, and agriculture have been already undertaken, some in the farms of the neighborhood, with the parsonage as headquarters, and others with working centers at the New Clairvaux farm-house, less than a mile away. All these industries are thriving, as much because they are well executed as because they meet real needs.

What is called the New Clairvaux table, made entirely of wood, without nails or glue, is a most interesting example of a country cabinet-maker's skill. Similarly, the baskets and the green and white embroidery produced at New Clairvaux are excellent products of handicraft.

When all is said, however, Mr. Pressey's work is emphatically homogeneous. In spite of the fact that he seems to be scattering his forces in many different directions, his scheme of life in New Clairvaux is simply a preacher's answer to the specific needs of country people in country places. He describes his country publication, "Country Time and Tide," as "a magazine of a more profitable and interesting country life," and he believes sincerely that what is needed in the

country town is to make life there cheerful and financially feasible.

When he first came to Montague, he observed that there were in the village many boys who had nothing to do. These he set at work picking berries at five cents an hour. The girls he likewise employed tending the baby, sweeping the piazza, and washing dishes at five cents an hour.

But the income of a country parson is too limited to warrant indefinite expenditure at even so low as a five-cents-an-hour rate. Hence the purchase of type and the setting up of the printing-office. The late Mayor of Thompson Island, the Farm School in Boston Harbor, is now the chief compositor of this office, and he will soon help form the Junior Country Town, which is so near Mr. Pressey's heart. Another boy, who has just graduated from the high school, is at New Clairvaux for the purpose of learning scientific agriculture. Later it is hoped that he may be developed into a farm superintendent.

And all the time applications are being received from other interested young men who see in this colony something both ideal and practical, something which gives promise of the fulfillment of the Emerson line that has come to be the text of the settlement: "I look for the supreme beauty to shine also out of the west," the west in this case being, of course, the hill towns of western Massachusetts.

A Unique Experiment in Profit-Sharing

By C. H. Quinn

A LABOR union that went into business for itself has just completed its first eighteen months, which has been an experimental period for a novel idea. The experiment involved co-operative profit-sharing labor by an average lot of American workmen. It has proved successful thus far, and there appears no reason why it should not so continue.

In the metal polishing and plating department of the great Eastman Kodak Works at Rochester, N. Y., a year and a half ago the men, about fifty in number, organized local union No. 113, and formulated a number of demands regarding their work and wages. These were presented to Manager Frank A. Brownell, and several conferences were held between him and the men. Any agreement was found to be impossible, and after much anxious thought, and when a shut-down was imminent, Mr. Brownell proposed to the members of the union that they start a polishing and plating plant of their own, and thus secure the profits they thought he was making. He promised that he would send them all the work that they could do as cheaply as the average plant of the kind in the city. At the same time they would have the privilege of getting all the work they could from the public.

The union held nearly an all-night session considering the novel idea. The men decided to try the plan, so instead of quitting work the next morning they sent a committee to select a building for their own plant. A two-story stone building, 70 × 100 feet, was found near their former workshop, and the committee rented it, with power and heat, for one year. The offer of Mr. Brownell to rent them the equipment of his shop was accepted. The machinery was moved in the night, and the work, very heavy in June, was not interrupted. The new concern was named "The Union Polishing and Plating Company."

Organization of the unique company was not effected without long and earnest thought and discussion. A talented attorney was engaged to draw up the necessary articles of agreement, which were signed by each of the workmen joining. It was decided that each one of the organizers should subscribe to $100 worth of stock in the enterprise, the amount to be collected by assessments as needed.

Control of the affairs of the business was vested in a board of nine directors, made up of the president, vice-president, secretary, and treasurer, and five stockholders. Besides this board there is a shop committee of three to whom all complaints are referred, and whose dictum is final.

The subscribed stock of $3,400 repre-

sented the thirty-four organizers of the company. Each started off with the hope of dividends on his stock in addition to his wages. None have been disappointed. Little money has been required on assessment in pay for the original stock. The workmen have received about 10 per cent. better wages than other workmen of their kind in the same city, and they have still their common interest in the concern.

Through natural causes, the number of stockholders has been reduced to twenty-one. Accordingly, the value of the individual interests has increased, as now each of the twenty-one has very near to one and two-thirds shares.

When a stockholder desires to sell out his interest in the company, he has, by a rule of the organizers, to offer it first to the other members. If the board of directors decide that the asked price of the departing member is too large, the board offers what it thinks the interest is worth. If the owner is not satisfied with the price offered, he has the privilege to sell his stock to an outside buyer. There are always outside buyers who are willing to purchase.

The men are paid by the piece for their work. Often their work gets so heavy in summer that extra help has to be hired. Wherever it is possible to utilize a boy, one is hired instead of a man. Many times last summer the force of forty or fifty men worked thirteen hours a day to fill orders.

There have been times, too, when business was dull and some of the stockholders had to be laid off. The single men were always willing to volunteer to take idleness, so that the married men could have the work and wages. They expected seasons of idleness on the co-operative plan just the same as though they were working for their old employer.

Of course the company made mistakes. But there were always so many partners that one or more would be sure to see them promptly. As each had the interest of the company at heart, as part owner, mistakes did not exist long.

Some men to whom the managing of the shop was given failed entirely as managers, and the board of directors lost no time in placing them back at the bench. In various ways the firm found where economy could be practiced or the work improved.

After watching the operation of the profit-sharing plan since its inception, President O. D. Stuart says of it:

"The method of co-operation is sound. It has been a success with us, and I know of no reason why a coal-mine could not be managed in the same manner. The difficulty in that case would, perhaps, be in the miners getting possession of a mine. But if they could, and have competent, honest men at the head, they could get along without the coal baron. With slight variations to suit different conditions, this co-operative profit-sharing plan can be used in many lines of work."

Specialization in History[1]

THE best work of the late Lord Acton, the profoundly learned Professor of Modern History at Cambridge, was not in any publication by himself, but in the plan of a work now to be executed by others, mostly of his own selection. The subject is not as new as the plan. Of new material, indeed, there is with every year a growing abundance, as the buried or neglected archives continue to come to light in frequent contradiction even of the classic historians. The increasing mass, already swelled beyond the compass of a single mind, has made a division of labor as indispensable to the scientific culture of history as it is to the progress of science in every other field.

Any single-handed attempt to write a consecutive history of the modern period not only encounters this baffling difficulty in the encyclopædic variety of material. Written from an individual point of view, it is inevitably subject to individual prepossessions dominating the writer's selection, emphasis, and judgment. The work of the Roman Catholic, the Protestant, the Positivist, of the Frenchman, the Briton, the American, however impartial in intention, needs in the result correction for the personal equation.

Lord Acton's plan, embodied in the

[1] *The Cambridge Modern History.* The Macmillan

present volume, meets these difficulties as far as they can be met. It distributes the vast field among specialists, each of whom has made his portion the subject of elaborate study. The report of such a one concerns his field alone, independently of its relations to things before and after. But were this all, the result would be a collection of mere monographs as disconnected fragments. Lord Acton's plan provides that the collection shall be a true series, in a definite line of development.

In such a line it is proposed to give no less than twelve volumes to the history of Europe and its colonies since the fifteenth century. The central idea of each volume is found in some signally important historical fact, selected as the nucleus around which the studies of the writer assemble the events, forces, and characters of a definite period to speak for themselves. Yet it is not a succession of episodes that is to result from this treatment, but a true series conformable to the modern conception of history as a progressive movement of mankind, to the evolution of which the national and individual factors are subsidiary.

The beginnings of modern history are fixed by no arbitrarily selected date, but by our recognition of the awakening of the modern spirit. This awakening has given its name to the epoch with which the introductory volume of the Cambridge series is concerned—the "Renaissance." This was a revival not merely of intellectual activity and culture. These were merely the concomitants of that in which the deepest distinction between the modern and the ancient or mediæval world is found. The modern spirit, with whose advent modern history begins, is the spirit of self-development, of self-realization—in a word, of individuality.

Quite appropriately, the story of the Renaissance, as told in the present volume, begins with two chapters on the New World of the far East and the far West, the discoveries of which were the first great exploits of the modern spirit, and reacted on the European mind for the invigoration of that spirit, as illustrated by such thinkers as More, Montaigne, and Bacon. The story of the Ottoman Conquest comes next, as it was the Turkish invasion that like a mighty wind swept westward from Constantinople to Italy the seeds of the new humanism in the intellectual treasures of the ancient world. Among the nations influenced by the Renaissance, Italy is naturally most prominent. Italy was the radiating center from which the intellectual quickening spread to the northern nations. In Italy its first fruits and some of its best fruits appeared. Five chapters are accordingly given to Italy, two of them to Florence for the exhibition of contrasted aspects of the Renaissance—the ethico-spiritual and the politico-intellectual, with Savonarola and Machiavelli as their exponents. In the chapter on Rome and the Temporal Power Dr. Garnett, of the British Museum, makes a noteworthy correction of historical tradition in the case of Pope Alexander VI., whom he pronounces, though utterly unprincipled, clear of the most odious imputations. Other European countries, destined to later importance, but having less significance for this period, occupy comparatively little of the field of vision. Germany, Hungary and the Slavonic kingdoms, Spain, France, the Netherlands, England, are treated each in a single chapter. Thus the nations, forces, and interests which are to play their parts in the subsequent history are brought upon the stage.

From these local points of view, in which politics, economics, and social life are the subjects of chief interest, while art and literature, except as directly bearing on these, are relegated to special works, the reader passes on to outlooks over the field at large in various aspects. The economic change which revolutionized commerce, the classical renaissance in its revival of ancient learning, the Christian renaissance of interest in the primitive documents of faith and the history of the Church, are exhibited in successive chapters. The volume closes with a twofold view of the period as it is about to ripen into the Protestant revolution. Catholic Europe in its unstable equilibrium amid contending forces of good and evil is sketched by an eminent and fair-minded Catholic scholar, Dr. William Barry, while Mr. Henry C. Lea, the well-known historian of the Inquisition, describes The Eve of the Reformation. These two, however, are not conflicting but co-operating witnesses, their differ-

national relations, and their critical sketches of some historical personages. The United States comes into the field of view only in an account of its relations during the century to Great Britain. This is impartially drawn, with entire good feeling, in the hope that the kindred peoples may "work together side by side at the task of building up a realm which will be their common country."

London in the Eighteenth Century. By Sir Walter Besant. Illustrated. The Macmillan Co., New York. 9×11½ in. 671 pages. $7.50.

The large quarto form in which this work is published certainly gives distinction and beauty to the book, whatever may be said as to inconvenience of handling and reading. It is quite probable that Sir Walter Besant will be longer remembered as the historian of London than as the novelist. His books on Westminster, South London, and East London were really parts of a carefully planned whole, and the present volume covers another part of the work, although now the survey is of all London and for particularly a century instead of localized topographically. The point of view is chiefly that of the social life of the century, and how well the author knew that aspect is known to all of us who have read "The Chaplain of the Fleet." Sir Walter put nearly five years of actual labor on this book—a labor, however, which was a keen delight to him. He was wont to say that after a half-century's residence in London he never took a half-hour's walk without finding something new and suggestive for study. He had in mind a great "Survey" of London after the manner of Stow's famous book of three centuries ago, and in this many experts and special students were to engage. The present volume was to form a component section of the whole monumental projected work. It covers almost all aspects of London except the literary side, which was purposely reserved for separate treatment. History, topography, trade, government, manners and customs, church and chapel, crime and debtors' prisons, street scenes, and much else—all are treated with Besant's touch of fancy and romance, as well as with an exactness the result of years of research. There are many pictures, prominent among which are fine full-page reproductions of Hogarth's pictures relating to London.

Main Currents in Nineteenth Century Literature. By Georges Brandes. Vol. III. The Reaction in France. The Macmillan Co., New York. 5½×9 in. 300 pages.

The Outlook has already reviewed the first two volumes in this series, "The Emigrant Literature" and "The Romantic School in Germany." The third volume, recently published, deals with "The Reaction in France," and has to do with the Revolution, with Chateaubriand, De Maistre, Lamartine, Victor Hugo, and with the movement of French literature to the end of the first qnarter of the nineteenth century. Further comment will be made on this important work as it nears completion.

Marianela. By B. Perez Galdos. Edited by Edward Gray, A.B. The American Book Co., New York. 5×7¼ in. 264 pages. 90c.

New International Encyclopædia (The). Edited by Daniel Coit Gilman, LL.D., Harry Thurston Peck, Ph.D., L.H.D., and Frank Moore Colby, M.A. Vol. VI. Illustrated. Dodd, Mead & Co., New York. 7×10 in. 886 pages

Parliament, Past and Present: A Popular and Picturesque Account of a Thousand Years in the Palace of Westminster, the Home of the Mother of Parliaments. By Arnold Wright and Philip Smith. Illustrated. Vols. I. and II. E. P. Dutton & Co., New York. 8×11 in. $8, net. 2 vols.

A curious and interesting book. On the side of illustration alone one is surprised to find how much has been found in the way of engravings, caricatures, portraits, and famous paintings all bearing pretty directly on the subject. In fact, the two handsome volumes are crammed with pictures (many printed in color), and the panorama of history thus enfolded is almost fascinating. The accompanying historical narrative is readable and often dramatically vivid. The story comes down to our own day.

Pleasures of the Table (The). By George H. Ellwanger, M.A. Illustrated. Doubleday, Page & Co., New York. 6×9¼ in. 477 pages. $2.50, net.

Recollections of a Long Life. By Joseph Packard, D.D. 1812-1902. Edited by Thomas J. Packard. Byron S. Adams, Washington, D. C. 6×9¼ in. 364 pages. $2.25.

Professor Packard, whose life was spent in the service of the (Episcopal) Theological Seminary of Virginia, near Alexandria, was personally a most attractive character, and these "Recollections" form a most attractive book. They abound in personal reminiscences of men worth knowing, some of them known to him from his student days at Bowdoin, among such classmates as Cyrus Hamlin and Henry B. Smith, with Longfellow for professor of modern languages, and at Andover under Moses Stuart. Many a portrait, many a simple vignette of clergyman and layman, lends a charm to these pages, where churchmen and statesmen, missionaries and martyrs, are amply or briefly commemorated. It should be noted that the contrast drawn between the Congregational and the Episcopalian theory of the beginning of religious life in the young is not now so great as it appears in Dr. Packard's recollection of it, dated from many years ago. The volume is conveniently indexed.

Rome and Reform. By T. L. Kington Oliphant. In 2 vols. The Macmillan Co., New York. 5½×9 in. 541 pages. $7, net.

Reserved for later notice.

Selection from Mrs. Browning's Poems (A). Edited by Heloise E. Hersey. The Macmillan Co., New York. 4×5¾ in. 191 pages. 25c.

This is a very intelligently made selection of Mrs. Browning's lyric pieces—her most characteristic and successful work. Miss Hersey is always interesting, because she brings independent thought and fresh feeling to everything she touches. In her introduction, which is very brief, she gives a condensed biographical account of Mrs. Browning, and a condensed but very satisfactory characterization of her work. The volume is furnished with a chronological list of Mrs. Browning's works, and with a series of notes.

Things that Abide (The). By Orrin Leslie Elliott. The Murdock Press, San Francisco, Cal. 5×7½ in. 193 pages.

A Conservative, Dividend—Paying Investment.

Is offered by a Corporation engaged in the textile manufacturing business, having a paid up capital of $250,000.00 and superlative credit rating.

At a late meeting, the Stockholders authorized the Treasurer to offer for sale a limited amount of this Company's Treasury Stock, to provide for the extension of its market and field of operations. This Corporation was established in 1889, and is paying semi-annual dividends. The product of its several Mills has been extensively advertised for the past 5 yrs. The proceeds of the sale of this Treasury Stock, will be devoted to increasing its production and sales.

This Company has no bonded indebtedness, no preferred stock, and offers its shares at par. This will appeal to all who desire an absolutely safe, dividend-paying investment for amounts ranging from $50.00 up.

For full particulars, illustration of properties, and complete information, address—

Bright's Disease
AND DIABETES
CAN BE PERMANENTLY RELIEVED

The above is a startling statement (in view of the generally accepted theories), which should demand investigation from every afflicted reader of this magazine.

This investigation we sincerely invite, since we devote our entire attention to the two maladies above named.

The remedies for these diseases are entirely distinct, and the fact that we are specialists in these diseases *only*, should be sufficient for you to overcome your past prejudice, or what others cannot do, and investigate for yourself or some afflicted friend. *Not* patent medicines and *not* found at drug stores and only prescribed after analysis.

Note Send your name and address and we will forward instructions, etc., and will make analysis *absolutely without cost to you*, or obligation to commence our treatment.

Professional etiquette strictly observed. Names or letters are never published without consent. Consulting physician always in attendance.

FOR MUSICIANS AND MUSIC LOVERS

FROM GRIEG TO BRAHMS

Studies of Some Modern Composers and Their Art

BY DANIEL GREGORY MASON

Second Edition. Price $1.50 net (postage 11 cents)

"Mr. Mason's book cannot be too highly commended. It is a model, not only of good, temperate English, but also judicious criticism, which, while it suggests, and, indeed, emphasizes, the weakness or limitations of each composer, gives with a lavish hand and genuine enthusiasm honor where honor is due."
Charleston News and Courier.

Photograph by Hollinger

"For clarity of exposition and full, rich meaning must convince not only thoroughgoing music lovers, but the general reader, of their superior excellence. Moreover, Mr. Mason's work possesses merits of form and style that render it unusually attractive and justly entitle it to praise independently of its substance."
St. Louis Republic.

Mr. William F. Apthorp, Musical Critic of the *Boston Evening Transcript*, says: "Among the most valuable contributions to the literature of music that our country has given to the world."

"The ordinary man can understand what Daniel Gregory Mason says about music in his "From Grieg to Brahms," and not only will have a keener appreciation of what he likes to hear after reading the book, but probably also will find that he enjoys music hitherto incomprehensible to him, now that he knows something of the musical principles underlying the compositions."
—*Albany Evening Journal.*

Dr. Percy Goetschius, the well-known critic and the author of many musical works, says: "This gifted young author combines most happily the fullest practical insight, as professional musician, into the works of these masters, with the ability of the thoroughbred man of letters to give forcible and fluent expression to his carefully formed opinions of them. This rare combination, to which Mr. Mason adds thoroughly intelligent and impartial judgment, imparts a very peculiar value to his essays."

A copy will be sent on approval to any reader of The Outlook on receipt of a postal card order.

The Outlook is a Weekly Newspaper and an Illustrated Monthly Magazine in one. It is published every Saturday—fifty-two issues a year. The first issue in each month is an Illustrated Magazine Number, containing about twice as many pages as the regular weekly issue, and many pictures.

Price.—The subscription price is Three Dollars a year, payable in advance. Ten cents a copy.

Postage is Prepaid by the publishers for all subscriptions in the United States, Hawaiian Islands, Philippine Islands, Guam, Porto Rico, Tutuila Samoa, Canada, and Mexico. For all other countries in the Postal Union add $1.56 for postage.

Change of Address.—When a change of address is ordered, both the new and the old address must be given. The notice should be sent one week before the change is to take effect.

Discontinuances.—If a subscriber wishes his copy of the paper discontinued at the expiration of his subscription, notice to that effect should be sent. Otherwise it is assumed that a continuance of the subscription is desired.

How to Remit.—Remittances should be sent by Draft on New York, Express-Order, or Money-Order, payable to order of THE OUTLOOK COMPANY. Cash should be sent in Registered Letter.

Letters should be addressed:

THE OUTLOOK COMPANY

Unlimited Debate Last week Senator Quay attempted to break the deadlock upon the Statehood Bill by introducing a motion that a vote upon the measure be taken before the close of the session. The adoption of such a motion would of course have introduced in the Senate a modified form of closure, by which debates could be ended without unanimous consent. Naturally, the adoption of such a resolution to secure the passage of the Statehood Bill was sure to be resisted by the Republican Senators opposed to the bill, but the short debate upon it showed that its most strenuous opponents would be Democratic Senators in favor of the Statehood Bill. The adoption of a closure rule, they saw, would generally be a weapon in the hands of the Republican majority to limit debate desired by the Democratic minority, and they therefore had a partisan reason for refusing to follow Senator Quay in his new tactics to secure the passage of his and their Statehood Bill. Indeed, the debate in the Senate upon the closure resolution indicated that it had few friends in either party, Senators of the most divergent views maintaining that under the present rules it is always possible to get a vote upon a bill which a majority strongly favor. The remainder of the history of the week, however, hardly sustained this optimistic view. Early in the week it was thought that the Republican conference to secure action on the pending treaties had reached a unanimous agreement that the Statehood Bill should not be allowed to prevent the ratification of the Panama treaty. But later in the week Senator Quay came to the support of Senator Morgan in prolonging the debate on that treaty, by having the Clerk of the Senate read the Constitution of the United States of Colombia, and by himself reading long documents which the Chair refused to allow the Clerk to read because obviously introduced for purposes of delay instead of enlightenment. In justification of his course, Senator Quay stated that the reaching of a vote on the Panama treaty was no more required by the principles of majority rule than the reaching of a vote upon the Statehood Bill, and he proposed to have the one bill as fully debated as the other. He said that at the Republican conference he had assented to action upon the Panama treaty because of representations that our option to purchase the canal lasted only till March 4, but that on the day after the conference the newspapers announced that the Attorney-General had prolonged the life of the option by telegraphing our Government's acceptance of the Company's offer whenever the treaty was ratified. Upon this point it must be said that the Attorney-General's action could not bind the Panama Company to prolong the option if it desired to close it. Between Senator Quay and Senator Morgan the Panama "debate" was continued to the end of the week, though, of course, behind closed doors, so that the public has no authoritative means of learning the nature of the criticisms Mr. Quay makes upon the treaty. His most telling point thus far appears to be the charge that our payment to Colombia was increased from $7,000,000 to $10,000,000 in order to provide funds to quiet the Colombian revolutionists, and his demand that the Government correspondence be given to the Senate to show the truth or falsity of this charge. In the main, however, his reported arguments against the treaty are disquisitions upon the relations of Church and State in Colombia, and other matter bearing but remotely upon the question at issue. The net effect of the week's developments is to intensify public impatience with filibustering tactics, and to strengthen

[illegible] for a carefully guarded rule of closure by which debate can be brought to an end when every Senator interested in any pending measure has been granted a reasonable time to present his opinions. Such a rule should not be changed in the Senate as it has been in the House, but concession should be given

Philippine Relief Enacted and Wrecked

Among the proposed measures which have been allowed to pass through the Senate despite the "deadlock" of its doors are two bills for the relief of the Philippines. The first of these appropriates the $3,000,000 asked by Governor Taft for the relief of the present famine and to procure draft animals necessary for the revival of agriculture. The other establishes a relatively stable currency for the Islands. The latter measure in the form in which it has passed the Senate and will doubtless be accepted by the House, comes very near following the plan first recommended by Governor Taft and Secretary Root. The standard of value is to be a gold peso, worth one-half of a gold dollar, but the general medium of exchange will continue to be a silver peso of about the size of the Mexican dollar so long used as the monetary unit. The silver peso is to be kept at par with the gold peso by restricting the coinage of the former and establishing a gold reserve for its redemption on demand. It will be virtually a promise to pay gold, printed upon silver instead of paper. The Democrats in the House had stood for the principle that the people of the islands should have the same currency as ourselves, but there was little opposition in the Senate to the proposal that a distinctive Philippine currency, closely resembling that in use, should be continued. Some of the Democrats even thought that a distinctive currency for the islands was a better preparatory measure for their future independence. The opposition of Senators from the silver-producing States was avoided by the acceptance of an amendment offered by Senator Patterson, of Colorado, providing for the calling of another international conference to devise a plan for a fixed rate of exchange between gold and silver using countries. As the only plan now seriously proposed by those in power to accomplish this end contemplates the establishment of free coinage of silver by all other nations, including Mexico, the concession granted the Western Senators was not a victory for bimetallism. The Philippine legislation secured does not include the passage of the House bill reducing the tariff on Philippine products to twenty-five per cent.—instead of seventy-five per cent. as now—of the Dingley rates. The Senate Committee changed the rate to forty per cent. at the demand of the sugar and tobacco representatives, but even the small concession which the amendment will give is still vitiated because opposed by these private interests.

The Littlefield-Hoar Bill

Three of the eight Republicans on the Senate Judiciary Committee have voted with the Democrats to report favorably the Littlefield anti-trust bill, amended so as to render the measure more drastic. As amended, the bill not only restricts the use of the facilities of inter-State commerce by corporations which secure rebates and attempt to establish a monopoly by lowering prices in localities where competition is threatened, but also restricts the use of these facilities by corporations which "in any matter whatever" attempt to prevent competition. The amended bill also contains a definition of the word monopoly which accords with the popular use of the term. The fact that a combination may still have some competition—perhaps induced by the high prices it has established—does not, under the Hoar definition keep it from constituting a monopoly in the eye of the law. For corporations hereafter formed the amended bill penalizes over-capitalization in a manner highly satisfactory to those who believe in distinguishing between capital representing investment and capital representing extortion. Over capitalized corporations hereafter organized are denied the right to engage in inter-State commerce. Unfortunately, it is not believed that any action can be secured in the Senate upon this measure at this session.

The Alaskan Commission

Last week it was announced that the three Commissioners to represent the United States on the Alaskan Boundary

Commission would be Mr. Root, Secretary of War, Senator Lodge, of Massachusetts, and Senator Turner, of Washington; also that ex-Secretary of State Foster had been chosen to take charge of the case of the United States before the Commission. These appointments have been received with some disfavor in Canada; the Toronto "Mail and Empire" even calls upon the Dominion Government to protest. Though the Commissioners are admitted to be men of unquestioned ability and high character, the "Mail and Empire" declares that three men more disqualified by avowed prejudice or official commitment could not have been selected. "Jurists of repute they are, but impartial jurists they are not. . . . Secretary Root, being a member of the United States Government, is one of the parties to the dispute. The idea of a trial in which plaintiff or defendant should be a judge is too farcical to be thought of. . . . Senator Lodge has shown his unfitness for serving by his public utterances on the question. . . . A man so uncontrollably given up to an *ex parte* view cannot be accepted by this country as a member of the court. Senator Turner . . . has publicly stated that there is no case for reference. That is, he has made up his mind beforehand. He, therefore, has rendered himself incapable of sitting on that tribunal. . . . It was hoped that the President would have selected his jurists from the Supreme Court of the United States. To men so chosen, Canada could have no objection." The Hamilton "Herald" says that "the selection of these three men is little short of an affront to the British and Canadian Governments. It means that President Roosevelt is determined not to have a fair settlement based on the evidence, but to make sure that, in any event, there will be no danger of a settlement in harmony with Canada's claims." The Winnipeg "Telegram" adds: "While acknowledging the personal worth of the three gentlemen reported to have been appointed by the United States, we cannot but regard the appointment of active politicians as unfortunate. It probably means that the Senators who opposed the treaty altogether insisted, as the condition of ratifying the treaty, that men should be appointed who would be subject to popular feeling." On the other hand, the London "Spectator" regards Secretary Root as one of the ablest men now active in the Anglo-Saxon world of politics, and Senator Lodge as a man of great weight and influence, and a worthy representative of the best traditions of the Senate. Regarding Senator Turner the "Spectator" says: "He is less well known, at any rate on this side of the Atlantic, but we may be sure the President's choice has been wisely exercised, for Mr. Roosevelt would not choose inferior men."

❀

The Alaskan Difficulty

It is unfortunate that the American appointees to the Alaskan Boundary Commission are not those whom Canadians expected, for the sentiment which has arisen throughout Canada is that people on this side the border are unreasonable in their interpretation of the Anglo-Russian treaty of 1825 and of the Russo-American treaty of 1867, upon which the American claim is based. Those treaties provided that the eastern Alaskan boundary line should follow a mountain ridge parallel with the coast, if there be one not more than thirty marine miles from the coast; and if there be none, it should be drawn arbitrarily at that distance from the coast, following the windings thereof. The question turns on the use of the word "coast." Canada now holds that coast means the outermost edge of the outermost fringe of islands, from which the thirty miles should be measured inland, and that the coast line should not follow the winding, but run boldly from headland to headland. The United States, on the other hand, held and holds that "coast" means the edge of the mainland, and that all windings of the line between the headlands, six miles or more apart, should be followed. In this we are supported by the London "Spectator," which says: "It does seem to us, however, difficult to imagine that when the treaty asserts that the coast is the place from which the measurement is to be taken, it means anything but actual mainland—*i. e.*, conterminous land, and excluding all islands." The United States possesses, according to its interpretation of the treaty, a strip of coast land northward from Port Simpson, at fifty-four degrees forty minutes, unbroken by any inlet, affording

Canada no seaport or access to the Pacific except through territory belonging to the United States. The Canadians have contended that the words of the treaty of 1825 might be construed so as to allow the British to have outlets to tidewater, and even to own the harbors; but this view is not supported by any of the maps published during the half-century following, and is distinctly denied by the act of the Hudson Bay Company in renting land and water privileges from the Russians; if Great Britain had owned a harbor on the Pacific, the Company would undoubtedly have availed itself of it and not paid rent. Canadians claim, however, that their view had already been substantiated in the discussion between Russia and Great Britain from 1820 to 1825, during which Count Nesselrode, the Russian Minister of Foreign Affairs, said, according to a Canadian authority, "We limit our requirements to a mere strip of the continent, and, so that no objection be raised, we guarantee the free navigation of the rivers." This guarantee is incorporated in the treaty; yet, as the London "Spectator" says, if it were not intended to give to the Russians a strip thirty miles broad, why should Article VI. have so carefully protected British subjects in the right of free navigation of all the rivers and streams which, but for that stipulation, would have been barred by the strip of Russian territory? The first part of the adjudication before the Commissioners would seem to be fairly simple—the determination of the southernmost point of the Prince of Wales Island, of the identity of Portland Channel (despite Vancouver's ambiguous description of the channel, the only knowledge possessed by the Anglo-Russian negotiators), and of the line ascending that channel. The principal points at issue will be whether "a line parallel to the windings of the coast" is a line curving round all the indentations of the coast, whether the coast itself is a continuous strip or a series of disconnected fragments, and whether the watershed at White Pass, north of Lynn Canal, and only thirteen miles from Skagway, near the head of navigation, forms one of the points in the supposed mountain-line by which, under the early treaty, a boundary was sought to be established.

The Delaware Legislature on the Addicks Exposure

On Friday of last week State Senator Allee, of Delaware, one of Mr. Addicks's right-hand men, introduced the following resolutions into the Legislature of that State:

Whereas, In a recent article in a periodical known as The Outlook, one George Kennan makes the following statement: "Of the evidence obtainable in Delaware with regard to the use of depraved women as a means of disgracing legislators and enabling workers to hold or control doubtful men by threats of exposure it is not necessary at present to speak;" and

Whereas, This statement is a low, dirty, and incomprehensible lie, without any ground or justification therefor as far as this Legislature is concerned, or that of any other within our knowledge; and

Whereas, This statement is an insult to the Legislature of this State, and a gross reflection upon the fair fame of our Commonwealth; therefore be it

Resolved, Regardless of political differences of opinion, that we resent this pernicious falsehood, and direct a copy thereof to be sent to the aforesaid George Kennan as an expression of our views of this malicious defamation of Delaware.

By a combination of the Regular or anti-Addicks Republicans and the Democrats, these resolutions were voted down in the House and laid over in the Senate, and, in spite of the protest of the Addicks men, a counter resolution was passed in the Senate authorizing the purchase and distribution of a number of copies of The Outlook containing the article by Mr. Kennan, the object being to enable each legislator to see for himself what Mr. Kennan has said. The legislators of Delaware and the public generally will observe that Senator Allee's rhetorical resolution picks out for denial from all the charges of open, flagrant, and self-confessed corruption preferred, with dates and details, against Mr. Addicks and his adjutants, only one allusion. By passing in silence the greater and most important part of Mr. Kennan's charges Senator Allee and the Addicks Republicans virtually admit their truth. These resolutions are tantamount to a general plea of guilty, with a single reservation. In fact, Mr. Kennan has made no statement in either one of his three articles which, in the opinion of The Outlook and of competent lawyers who have been consulted, is not supported by legal evidence now in possession of Mr. Kennan and

The Outlook. The action of the Legislature on Senator Allee's resolution is another indication of the persistence and courage with which the better elements of Delaware have fought the forces of corruption at Mr. Addicks's command for fourteen years.

❀

The Beef Trust Enjoined

The temporary injunction granted by Judge Grosscup, of the United States Circuit Court, in Chicago last week against the combination of packing-houses known as the Beef Trust, will renew popular faith in the vitality of the Sherman Anti-Trust Law in the hands of an administration bent upon enforcing its provisions. Since the decision of the Supreme Court, in the suit brought for the dissolution of the Sugar Trust, that the act did not reach such a combination of manufacturers—as its provisions were directed only against monopolies in inter-State trade—the opinion has widely prevailed that the Sherman Act was valueless except against combinations of inter-State railroads and other carriers. The text of the Sugar Trust decision, however, did not warrant so pessimistic a conclusion, as the Court merely affirmed that the Sugar Trust's purchase of competing refineries in different States bore no direct relation to inter-State commerce, and therefore could not be prevented "in the mode attempted." Later decisions of the Federal Courts, in the cases of combinations controlling the sale in different States of cast-iron pipes (Addyston Pipe and Steel Company) and of coal (Coal Dealers' Association of California), have affirmed that such combinations come within the scope of the Sherman Act, and are in violation of its provisions. Judge Grosscup's decision last week, in a case far more important than either of these just mentioned, puts in striking terms the wide range of business transactions which cannot be restrained by a combination without violating the Sherman Act. In the eye of the law, said Judge Grosscup—

> commerce is not restricted to specific acts of sale or exchange. It includes the intercourse, all the initiatory and intervening acts, instrumentalities, and dealings, which directly bring about the sale or exchange. Thus, though the sale or exchange is a commercial act, so also is the solicitation of the drummer whose occupation it is to bring about the sale or exchange. The whole transaction, from initiation to culmination, is commerce. When commerce, thus broadly defined, is between parties dealing from different States, to be effected so far as the immediate act of exchange goes by transportation from State to State, it is "commerce between the States," within the meaning of the Constitution and the statute known as the Sherman Act.

Turning from the general principle thus lucidly stated to the combination of the packing-houses, the Court finds that both in the purchasing of cattle and in the sale of meat the houses engage in inter-State commerce. Inasmuch, therefore, as they are indicted for requiring their purchasing agents not to bid against each other, for bidding up, through their agents, the price of live stock for a few days to induce large shipments and then ceasing from bids when the shipments arrive, for agreeing upon prices, cartage charges, and the like, and for making agreements with transportation companies for discriminating rates, Judge Grosscup holds that their combination is within the reach of the Sherman Anti-Trust Law, and must be enjoined pending a trial as to the truth of the averments in the indictment.

❀

Judge Grosscup's Address

Judge Grosscup, who rendered this decision, has recently delivered before the students of the University of Michigan an address which seems to us to constitute both a new and a valuable contribution to the solution of our industrial problem. This address is so compact that it is difficult to give anything more than a hint as to its suggestion, which is what we here attempt to do:—A process of industrial consolidation is going on, in which the control of industry is rapidly narrowing, and the mass of the people are coming to be lookers-on or participants in industries in which they have no proprietorship. At the same time the people are growing in wealth—that is, in financial ability to have a share in the proprietorship. This is shown by a comparison of the growth of population, the growth of general wealth, and the growth of bank deposits. For example, from 1880 to 1890 the growth of population was about 20 per cent., the growth of general wealth about 25 per cent., the growth of bank deposits about 73 per cent. Again, from

1890 to 1900 the growth of population was about 20 per cent., of the general wealth about 23 per cent., of the bank deposits 85 per cent. "Can any one explain this disproportion of the growth of uninvested capital—a disproportion beginning with activity in consolidation, and rising rapidly as consolidation increased—except upon the inference that the people, having little confidence in existing trust organization, have been thus cut out from ownership in the industries of the country? . . . Showing as they do that the people at large are withdrawing from ownership in the industries of the country, they point to a time in the near future, if the present methods of consolidation go on, when, barring the shopkeeper, the farmer, and the owner of city real estate, and barring the man who is willing to take chances upon an unknown venture, there will be but comparatively few proprietors among the run of citizens who ordinarily would be interested in the country's industries." It is true that these bank deposits furnish most of the capital upon which modern consolidation depends. But this does not give the people control of the industries. They are simply lenders of the capital on which the industries are carried on, and they get no other interest in the country's advancing prosperity except the interest on their deposits, which is less than was ever paid before. These facts are giving rise to widespread and increasing discontent among men of moderate capital, a feeling that somehow they have been deprived of their fair share in the rewards of industrial enterprise, and a growing inclination toward some form of Socialism, involving to a greater or less extent public ownership of most if not all means of production and distribution—a scheme which, in Judge Grosscup's opinion, is opposed to the fundamental and underlying conception of American life, and the secret of its real prosperity, the principle that "the man is everything, the State only an instrument for his protection and advancement." Thus "the separation of labor from proprietorship—the separate mobilization of these two forces as enemies instead of their commingling in common interest—is the most unrepublican and menacing fact that now confronts the American people." For if consolidation leading to monopoly is destructive of the Republic, in one way, Socialism, or the public ownership and the political organization of industry, is destructive in another. Socialism would "merge business into politics, and transfer industrial leadership from the men who think to the men who can pull wires and play the demagogue."

❀

The Remedy The remedy for these perils, according to Judge Grosscup, lies, not in the destruction of our industries, not in the arresting of their development, not in the transfer of industrial activities to the State, making them a political function, but in a process which will—to coin a word—"peopleize" the industries. This can be done by bringing the industries under such Government supervision and control as will make them safe subjects for public investment. "I believe that once corporate organization and management is cleared of thimblerigging and pitfalls, so that the fortunes of an enterprise will be bound up, not in an overstrained organization, but solely in the vicissitudes of the business itself, the American people will be found ready to take up again their share in the proprietorship of the country." This belief is founded on the following considerations: It is instinctive with the American people to acquire property. It was this instinct, as much as the desire for civil and religious liberty, that brought our fathers across the ocean, and has made their sons pioneers in building up the West. The instinct is "innate, persistent, unconquerable." The people have the means which would enable them to become the proprietors of the great industries. In the savings bank alone are accumulated nearly three billions of dollars. "This means that there is now, in the hands of the people, uninvested capital nearly sufficient to buy out, at the valuations of 1890, the existing manufactories, or the existing railroads, or one-half of the farm property of the country. It constitutes nearly one dollar in ten of all the dollars that measure the country's entire wealth; and what is more, it is available at any moment to enable the people at large to re-enter the proprietorship of the country." The owners of this capital are not afraid to invest. The fact that they

have deposited this money in the savings banks shows not only that they possess the capital, but that they have faith in corporations to safeguard and to return interest on the capital. They have faith in these corporations because they are under government regulation and subject to government supervision—that is, the rights and interests of the people in them are adequately protected. All that is necessary, therefore, to transfer these deposits or a considerable proportion of them from the banks to the industrial corporations, and so transfer the control of the industrial corporations from the few capitalists to the great mass of the people who are the lenders, is to secure a recognized, uniform basis for corporate organization, a guarantee that the stock and bonds represent the real value of the corporation assets, not a fictitious value put upon them, and a provision for governmental visitation, through some proper department, so that it can guard the interests of stockholders, as they are now guarded in the National banks. The legislation already enacted by Congress is not adequate for this purpose, though it may be regarded as a movement in this direction. It is not necessary for us here, in reporting Judge Grosscup's address, to do more than add in the simplest phraseology our hearty indorsement. The churches, the schools, the government—that is, the religious, the educational, and the political institutions of the United States—are democratic in their structure. All the people are alike interested in them, all the people share in their control. What is necessary for the solution of our industrial problem is that all the people should have an interest and should share in the control of our industrial organizations. The method which Judge Grosscup has indicated seems to us far more hopeful of right results, and it is far more in accordance with the American spirit, than that State Socialism which finds its chiefest exponents in Germany.

❀

Macedonia and Bulgaria

Last week the Austro-Russian note outlining a programme of Macedonian reforms was approved by the various European Cabinets and submitted to the Sultan. The suggestions contained in this joint note should have due effect upon Abdul Hamid, since they are insisted upon by the unanimous action of the Powers. They are not as drastic as those suggested by M. Steeg, the French Consul at Salonika, which formed the basis of the note. His plan was: (1) That a Christian Governor should be appointed for Macedonia with full powers; (2) that soldiers should receive regular pay, so as no longer to be compelled to rob the inhabitants; (3) that tax-gatherers should be paid for their services, and their operations controlled; and (4) that both Christians and Muslims should be employed on the police and tax forces in such proportions as to correspond with the prevailing religion in each vilayet or district. The note as finally framed strikes out all reference to Macedonia; it was considered that the designation of one part of the country by name might increase the anti-foreign agitation which the Powers are professedly seeking to check. The note is generalized so as to cover all the localities where Christians reside. The protection of the lives and the complete safeguarding of the interest of the Christians form the chief features of the paper. Abdul Hamid will undoubtedly feel more inclined to grant these requests than those in M. Steeg's plan. That scheme had commended itself to the Powers because it would not have exceeded in cost the revenues of Macedonia, or would not have infringed upon the Sultan's territorial prerogatives, or even tended to dismember his Empire. The French Consul's plan had the further merit of not placing the Bulgarians in Macedonia above the Servians or the Greeks there. So great is the jealousy among these three classes of Christians that some of the Greeks have even declared their preference for the Turkish rule rather than the Bulgarian. With his customary cunning, Abdul Hamid has long played off these jealousies of one against another, and has believed, as do many Christians, that such animosities would make it impossible to constitute out of Macedonia an independent State, as the Powers had done with Bulgaria. Indeed, Bulgaria remains nominally a tributary State of the Turkish Empire under European protection, although created a quasi-independent principality in 1878 by the Congress of Berlin. It is

from Bulgaria that nine-tenths of the present incitement to rebellion comes. Probably acting under pressure from the Powers, the Bulgarian Government last week arrested certain Macedonian revolutionists on Bulgarian soil, carefully not executing their arrest, however, until the most prominent had managed to escape. It would seem imperative to the welfare of Bulgaria that the Powers should remain without any doubt in regard to Prince Ferdinand's intention to keep the Macedonians within his borders quiet and orderly, and really to help the Powers in carrying out whatever scheme of pacification may be proposed. The good faith of the Bulgarian Government, since the arrests, has been not unnaturally questioned by the revolutionists, who have hitherto enjoyed a certain indirect countenance from it, and who now protest against its action. In Macedonia they have provoked a more serious conflict than any which has yet taken place. According to report, the disturbance occurred near Dubeny, and ninety Turkish soldiers were killed.

In Venezuela The disputes with the allies now seem in a fair way of settlement, and Venezuela points to an award just made by Venezuelan courts in favor of the claims of American citizens as a proof of her desire to treat foreign creditors fairly. The blockade has been removed, and the captured gunboats are to be given back; as to this last matter President Castro has shown needless irritation at the delay of Germany in handing over the vessels. President Castro's action in increasing customs duties by thirty per cent., because thirty per cent. of the receipts are to be given to foreign creditors, seems at first almost humorous, but while it is improbable that the full amount needed can thus be raised, it is probable that Venezuela's net receipts may be increased to some extent—at the expense, of course, of the consumer and taxpayer. But while Venezuela's foreign outlook is brighter, her internal strife seems to be becoming even more serious than it has been—and for at least two years it has been serious enough. It is now reported that a revolutionary army, estimated at 2,800 men, has reached a point about twenty miles south of Caracas, that the revolutionists and the Government troops both occupy strong positions, and that a decisive battle is probable. The revolution begun by General Matos during the course of the blockade of the Venezuelan coast by the allied war-ships has been reorganized, it is said (all reports about revolutionary movements in South America are likely to be flatly contradicted by the next mail), and three armies have been formed. Elsewhere in this issue will be found an article from The Outlook's correspondent in Venezuela, Mr. James Barnes, which gives an illuminating view of political methods and popular indifference in that country.

The Pope's Jubilee Last week Leo XIII. celebrated the twenty-fifth anniversary of his election to the Pontificate, an occasion of interest not only to Roman Catholics but also to Protestant Christians. "It seems impossible that it is twenty-five years since I have been there!" was his exclamation as he looked from the window of his apartments early in the morning into the sunlit Piazza of St. Peter's. Although the cathedral of St. Peter's is considered a part of the Vatican, the Piazza, or large oval square in front, is not; and the Pontiff was referring to his long term of self-imposed imprisonment, during which he has never gone beyond the Vatican's bounds. The Pope held his jubilee in the Hall of Beatification, situated above the portico of St. Peter's, and also the adjoining Sala Ducale and Sala Regia. It was estimated that the three rooms held five thousand persons. Many more thousands crowded the great cathedral below, where simultaneously a solemn thanksgiving service was held. Leo XIII. was dressed in full Pontifical robes, and wore on his head the triple crown. He was carried in the *sedia gestatoria* by eight men clothed in red brocade, preceded by the Sistine choir, and was surrounded by the Noble Guard, whose presence was really necessary for protection, on account of the intense desire of the faithful to touch the hem of the Pope's gown. The Pontiff has never been received with greater or more genuine enthusiasm. The ceremony included the reading of an address by Cardinal Respighi, Vicar of Rome, offering to the

Pope a gold tiara (the twenty-five-thousand-dollar jubilee present of the Roman Catholic world), together with a purse of forty thousand dollars. Cardinal Ferrari, Archbishop of Milan, read an address and presented the gold, silver, and bronze commemorative medals. A third address was read by Cardinal Boschi, who presented the symbolic keys and another purse of forty thousand dollars. In reply, his Holiness expressed satisfaction at the manifestation of which he is the object on the part of the faithful; but especially that, for the second time in a century, "Christ has wished to glorify his Vicar on earth by allowing him to reach the years of St. Peter." Protestants as well as Roman Catholics will join in the wish that a century of years may be granted to Leo XIII., in many respects the most distinguished and useful Pope who has ever filled St. Peter's chair.

❀

Professor Delitzsch and the Emperor of Germany

Professor Friedrich Delitzsch, son of the late Professor Franz Delitzsch, has been for some time carrying on explorations in Assyria, with the sanction of the German Emperor, who has subscribed to the funds by which these explorations have been carried on. Professor Delitzsch's discoveries have excited marked interest; but his deductions from these discoveries have excited still more opposition and apprehension. Like some others of the same school, he has shown a tendency to draw very large conclusions from small premises, and also to depart from scientific exploration and enter the domain of dogmatic theology. These tendencies would probably have no great concern to the orthodox but for the impression that he is indorsed by the German Emperor, who is the head of the Church. This impression has led the Emperor to define his position in a published letter which is of no inconsiderable importance to the world at large as well as to the Established Church of Germany. He criticises Professor Delitzsch for the tendencies to which we have referred, and expresses his radical dissent from certain of Professor Delitzsch's theological deductions, especially the denial of the divinity and the Messiahship of Jesus Christ. He very truly says, "We prosecute excavations and publish the results thereof in behalf of science and history, not to confirm or attack religious hypotheses with Professor Delitzsch, the theologian who has run away with the historian." It is a pity that Professor Delitzsch had not realized that, to be truly valuable, his investigations should have been made, and their results reported, in this non-polemical, non-theological, scientific spirit.

❀

The Emperor's Definition of Revelation

The Emperor then goes on to define his own views respecting revelation, in a paragraph which indicates his possession of a theological thoughtfulness and acumen which have not generally been attributed to him:

I distinguish between two different kinds of revelation—one progressive and, as it were, historical; the other purely religious, as preparing the way for the future Messiah. Regarding the former it must be said—for me, it does not admit of a doubt, not even the slightest—that God revealed himself continuously in the race of men created by him. He blew into man the breath of his life, and follows with fatherly love and interest the development of the human race. In order to lead it forward and develop it he reveals himself in this or that great sage, whether priest or king, whether among the heathen, Jews, or Christians. Hammurabi was one; so was Moses, Abraham, Homer, Charlemagne, Luther, Shakespeare, Goethe, Kant, and Emperor William the Great. These he sought out, and endowed with his grace, to accomplish splendid, imperishable results for their people, in their intellectual and physical provinces, according to his will. How often my grandfather pointed out that he was only an instrument in the Lord's hands! The second form of revelation, the more religious, is that which leads to the manifestation of our Lord. It was introduced with Abraham, slow but forward-looking and omniscient, for humanity was lost without it. Now begins the most astonishing activity of God's revelation. Abraham's race and the peoples developing from it regard faith in one God as their holiest possession, and, it follows, hold fast to it with ironlike consistency. Split up during their Egyptian captivity, the divided elements were again welded together by Moses, ever trying to hold fast to their monotheism. It was the direct intervention of God that caused the rejuvenation of this people, thus proved through centuries, till the Messiah, heralded by prophets and psalmists, finally appeared, the greatest revelation of God in the world, for he appeared in the Son himself. Christ is God—God in human form. He redeemed us and inspires us, entices us to follow him. We feel his fire burning in us. His sympathy strengthens us. His discontent destroys us. But, also, his intercession saves us. Conscious of victory, building solely upon

his word, we go through labor, ridicule, sorrow, misery, and death, for we have in him God's revealed word, and He never lies.

The New York "Sun," which has heretofore regarded all doubts of the infallibility of the Scriptures as incidentally leading to infidelity if not as constituting the essence of infidelity itself, seems to have undergone a sudden change of convictions as the result of this letter of the German Emperor. Connecting it very properly with the act of the Pope, last October, constituting a commission for the special study of the Bible in a free and scientific manner, making use in their study of "authors outside the Church, especially in matters of criticism," the "Sun" takes the occasion to declare that "in the Protestant world almost every scholar of distinction, and the vast majority of learned theologians, are on the side of the new critics," and recognizes, we are glad to see, that "a very great change, a tremendous religious revolution, is involved in this new view and new method of criticism of the Bible so generally accepted on the authority of science and scholarship, and even of teachers of religion and theology themselves." It is clearly worse than futile for clergymen to insist that there is no such revolution; clearly their duty to prepare their congregations to meet it, by showing them that the religious life is not identified with or dependent upon the old unscientific view of the Scripture as an infallible rule of faith and practice, and as constituting, not merely a supreme minister to faith, but the foundation on which faith must rest.

❀

The Bachelor's Degree at Harvard

President Eliot's annual reports are always interesting because they bring one or two aspects of the educational condition into striking prominence. The report this year comments at length upon two facts which are of special interest to the country at large. It is significant that, within a very few months, the Presidents of Harvard, Yale, Princeton, and Columbia Universities have all spoken on the question of the length of the college course, the value of the bachelor's degree, or the standard of requirements for admission to the professional schools. These topics are the focal points of discussion in the academic world of to-day. President Eliot emphatically declares that at Harvard no step will be taken in the direction of lessening the requirements for the bachelor's degree. Reviewing the recent steps by which the requirements for that degree have been brought to their present state, President Eliot says: "It is obvious from this review that the three years' course for the degree of Bachelor of Arts at Harvard University is intended to demand as much work and as high attainments as are demanded in the four years' course;" and he adds that the governing boards and faculty of Harvard have no intention of permitting the requirements for that degree to be lowered, although they have made it possible for students to attain the degree in three or three and a half years instead of four. "Harvard University," he continues, "has no sympathy with any efforts to lower the plane of the degree of Bachelor of Arts, or substitute for it an inferior degree." After giving the percentage of men who hold preliminary degrees and are now in the professional schools in nine American universities, ranging from 78.1 in Harvard to 12.3 in Cornell, President Eliot declares: "There is no more important question in the higher education in America than this: 'Shall the professional schools in university towns be open to uneducated persons, or persons of very slight education, or shall all require for admission a preliminary degree in the arts or sciences?'" Harvard University, he declares, has definitely determined to require for admission to its professional schools a preliminary degree, and has already applied this policy to all its professional schools except the dental schools, with the result of securing a striking improvement in these schools.

❀

Does the Educated Class Reproduce Itself?

The subject which will interest the greatest number of people in President Eliot's report is that of the vital statistics of six Harvard classes more than twenty-five years out of college. These figures show that the average number of children born to the members of these classes is about two in each family. In the case of one class the number of children is exactly twice the number of married members, while in two other classes the number of children is within one of twice the number of married

members. "If it be assumed that the surviving children are about one-half males, it follows that these six classes have by no means reproduced themselves. . . . They have, indeed, fallen 28 per cent. short of it." President Eliot reaches the conclusion that the highly educated part of the American people does not increase the population at all, but, on the contrary, fails to reproduce itself. This is due in part, he thinks, to the late postponement of marriage on the part of educated young men; a postponement which is compelled by reason of the protracted education now a requirement of entering the scientific and learned professions.

❀

Editorial Changes The death of Mr. Edward Perkins Clark, for eighteen years a member of the editorial staff of the "Evening Post," of this city, marks the end of a professional life of unusual intelligence and devotion. Mr. Clark was the son of a Congregational clergyman, and received a thorough New England education at Phillips Academy and Yale College. He began his career as a journalist in the office of the Springfield "Republican," was later a member of the editorial staff of the Philadelphia "Times," and still later acted as Washington correspondent of the Philadelphia "Press" and the Springfield "Republican." In 1881 he became associated with the Milwaukee "Sentinel." A year later he came to New York and became connected with the Brooklyn "Standard Union," where he remained two years. His association with the "Evening Post" dates from 1885. To his work on that influential journal Mr. Clark brought thorough journalistic training. He had considerable experience in his profession; he had American political history at easy command, and he knew the public lives of men of several generations. He studied local political movements with the utmost attention, and had at all times a minute knowledge of the political situation in different parts of the country. The thoroughness with which his journalistic work was done was evidenced in the skill and persistency with which he fought against the Blair bill, which proposed to organize and conduct public education in the South at the expense of the Federal Treasury, and with which he uncovered years ago the abuses of the pension system. He was a man of unblemished integrity, of indefatigable industry, and full of delicate consideration for others. A further change in the staff of the "Evening Post" is made by the retirement of Mr. Horace White from the position of chief editor, and the promotion of Mr. Rollo Ogden to that position. Mr. Ogden is a graduate of Williams College, and has been for nearly twelve years a member of the editorial staff of the "Evening Post." He brings to his delicate and difficult work thorough scholarship in several departments, trained literary judgment and skill, and a rare degree of independence of opinion and action. The accession to a position of such influence of a man of Mr. Ogden's personal character and intellectual qualities is a very gratifying evidence of the fact that journalism in this country still offers great prizes to men of high capacity.

❀

Mr. Conried and the Opera Lovers of music are deeply gratified by the selection of Mr. Heinrich Conried, manager of the Irving Place Theater in this city, to succeed Mr. Maurice Grau as manager of the opera for the next five years. Mr. Conried possesses the double qualifications necessary for a thoroughly successful high-class management of the opera: he is a business man of large experience, who has demonstrated his practical sagacity by his success, and he is also a man of artistic education and taste, who has treated the drama as literature and not simply as a means of making money. The performances given under his direction at the Irving Place Theater have been conspicuous, not only because actors of first-class ability have appeared in them, but because all the details have been supervised with the utmost care, and everything possible has been done to give the plays artistic harmony and completeness. This is precisely what the opera at the Metropolitan Opera-House has lacked. New York has had at times the most brilliant singing to be found in any city in the world. It has had, not only stars of the first magnitude, but constellations—groups of artists of the highest rank; but the details of the opera have been sadly overlooked and undervalued,

and the performance has therefore lacked, so far as the management is concerned, thorough artistic treatment and artistic feeling. It is precisely these qualities that Mr. Conried will undoubtedly introduce into his management. He has had very large experience in studying the resources of the drama abroad and in negotiating with foreign artists, and this experience will serve him in good stead when he transfers his work from the dramatic to the operatic stage. The public may confidently look, not only for the appearance of great singers in the Metropolitan Opera-House, but for careful and artistic stage management; for the treatment of the opera as one of the great arts, and not simply as an instrument of pleasure or a means of making money. Mr. Grau, who is a man of great energy and persistence, has laid a strong financial foundation on which Mr. Conried will be able to build up an artistic success. Mr. Herz, who will remain at the Opera-House, is an admirable conductor; and the reputation of the house is such that the best singers in the world are very glad to form engagements with its manager.

❀

Musical Aims and Business Principles

The Chicago Orchestra has been, ever since its establishment, one of the notable agencies contributing to the musical life of the United States. Theodore Thomas, who has done as much for the development of American musical taste as any other man, has been its conductor, and by means of it has done much to create and foster the higher life of the city. Successful though the orchestra has been, it has not been self-sustaining. Its experience has been that of almost every institution genuinely devoted to the cultivation of art or education. The trustees of the organization, having faced a deficit each year, and recognizing the fact that the sinking of money in the payment of an annual deficit "does not appeal to the average imagination," have issued a letter to "the patrons of the Chicago Orchestra." The soundness of the business principles they there set forth, and the genuineness of the high artistic aims they assert, are rare in combination. In this letter they make known the fact that at the close of last season they had formally resolved to disband the orchestra unless adequate endowment could be secured. In this they had the hearty approval of Theodore Thomas. They declined to consider putting the orchestra on a so-called "business basis" by reducing salaries and lowering the standards of quality in the selection and performance of music. Regarding the orchestra they say that they "have carried it on hitherto as an art and educational institution worthy of endowment, and would courteously decline to take further interest in it if it is to become a mere amusement enterprise." They announce that a subscription of $750,000 is needed. Of this amount $100,000 has already been raised. A lot for the site of a building has been purchased, where it is hoped a permanent home for the orchestra will be erected which will stand as a center of musical life. Disbandment or endowment is, therefore, the issue. It is to be hoped that the danger of disbandment will not last long. In comparison with the action of the trustees of the Chicago Orchestra, the action, or rather the deliberate inaction, of the New York Philharmonic Society, of which Theodore Thomas was conductor before he went to Chicago, affords a disheartening contrast. It is not necessary here to recount details. It is enough simply to say that Walter Damrosch, who undertook to vitalize the orchestra, has found its members unwilling to be vitalized, and therefore has made his decision to withdraw at the end of the present season.

❀

The Continued Assault on the Tenement Law

As the readers of The Outlook know, several bills changing the present requirements as to the building of tenement-houses have been introduced into the New York Legislature. The provisions of these bills are so indefensible that the only pretense at defense of them that has been made has taken the form of personal and virulent attack upon those who have brought about the present most salutary law. It is very evident that these disgraceful measures have been proposed simply in order to frighten the supporters of the present law into making some concessions. It is likely that the practical withdrawal of the nefarious Marshall bill will be followed by the withdrawal of its fellows. But these with-

drawals are in turn likely to be followed by the introduction of other amendatory bills which will appear mild by comparison, but which will nevertheless be utterly pernicious. This policy that has been followed by the assailants of the tenement-house law can have but one effect upon people of self-respect. It will stiffen them against any kind of change. For it has made it impossible for any change to be made without the effect of concession. When the forces that are at work for disease and death are making an assault upon public health and life and character, it is no time for concession. The present, therefore, is no time for any change whatever. Citizens of New York State who do not believe in spreading tuberculosis and social evil by law should protest against whatever change has been or may be proposed. They can do so by writing to Governor B. B. Odell, Jr., Albany, N. Y., Mayor Seth Low, New York, N. Y., and to the Hon. Horace White and the Hon. Jean L. Burnett, Chairmen of the Cities' Committees of the State Senate and Assembly respectively, and to their own Senator and Assemblyman.

❀

Unparalleled Impudence

One of the most significant documents in the extraordinary campaign now being waged between J. Edward Addicks and the State of Delaware is a mandate issued by Mr. Addicks and signed by his initials. It will not bear condensation:

On the Republican side there are but two things the bolters can do.

First—The ten men now voting against J. Edward Addicks can come into a common caucus of thirty-one Republicans. In this case Mr. Addicks will withdraw and his twenty-one friends will nominate two Union Republican Senators as near to Mr. Addicks as possible, and the whole thirty-one will elect them. Of course, if the bolters can find any way whereby ten men can beat twenty-one, they can nominate one of the Senators.

Second—Each side can elect one senator without dictation from the other side. In this case Mr. Addicks will be the choice of the Union Republicans. No dictation will be permitted by the Union Republicans.

On the Democratic side the Democrats can join the bolters and elect anybody the coalition pleases. This cannot be prevented by the Union Republicans, and they would not lift a hand to prevent it.

As to the future position of the Union Republicans—in no event will any more notice be taken of the bolters in Newcastle County. No more common primaries will be tolerated which would be binding on honorable Union Republicans and not binding on bolters. *No man who refused to vote for J. Edward Addicks in the Legislature will ever be allowed to hold any office in Delaware, nor will any bolter sympathizers be permitted to come to the front.* Union Republicans will nominate a straight ticket in Wilmington and throughout the State in the long future. As to the appointments—Congressman Ball cannot get a Federal appointment. After March 4 the appointments, according to custom, ought to go to the Chairman of the Union Republican State Committee and the National Committeeman, J. Edward Addicks. We will see where the power will lie.

The first impression produced by this letter is its extraordinary effrontery. Never, perhaps, in the history of attacks on free institutions has there been a piece of more brazen insolence than the attempt of a man who has no place in the government of a State, who is a private person of such record and character that no office ought to be open to him in any decent community, to dictate the policy of his own party and the political fate of the members of the Legislature. Such a document issued by the Czar of Russia would call forth sharp criticism throughout Europe; and the Czar is not only an absolute ruler, but a man of the highest personal character; such a document issued by a private citizen of Mr. Addicks's record, in a State governed by popular suffrage, in a country governed by a popular constitution, is an anomaly which foreign students of our politics will be greatly perplexed to explain.

More important, however, is the searching light which this letter throws on the system of appointing office-holders under the National Government. When Mr. Addicks declares that no man who refuses to vote for him in the Legislature will ever be allowed to hold any office in Delaware, and no bolter sympathizers will be permitted to come to the front in that State, he plays the part of a boss clothed with absolute power; but when he declares that after March 4 the appointments ought to go to the Chairman of the Union Republican State Committee and the National Committeeman, J. Edward Addicks, and adds, "We will see where the power will lie," he brings into striking relief the un-American, unbusinesslike, and corrupt and corrupting system which now, by tra-

dition, and by what is called the courtesy of the Senate, has made the President of the United States, in his best estate, the servant of a party, and has made of the United States Senate—the highest legislative body in the country—a brokerage office for the distribution of patronage. It is well known that there are many Senators who make it their principal business, not to attend to public affairs, to examine public questions, discuss public problems, or to consider public interests, but to watch the lists of office-holders, note every death, resignation, or removal, and promptly apply for the vacancy. Sent to the capital to represent a sovereign State, they use their position simply for doing a brokerage business in the distribution of Federal offices. So thoroughly has this system been organized, so highly developed has it become by expert practice, that it is now an automatic machine. The President of the United States, charged solely to care for the interests of the people of the country and to appoint men to care for those interests, is expected to consult the Senators from each State, and the Senators are expected to recommend men who are known as "regular;" that is to say, men who have always stood for their party, and can be counted on to do party work. If the President ventures to make an appointment of an eminently fit man on his own motion, or to refuse to appoint an eminently unfit man, he is confronted by both parties in the Senate, one party standing by the other as a matter of "Senatorial courtesy," and in order to preserve a system which degrades the Senate, which has seriously impaired its prestige, which makes the representatives of sovereign States in the National capital the hired men of political organizations, and which reverses the real method and the true intent in the appointment of public officers. Mr. Addicks has served at least one good purpose, as men of his character and reputation often do: he has, in his own life and actions, illustrated in the most concrete way the worst vices of our political system; he has shown how heinous and offensive they are when they are brought from under cover; and he has now made clear, as it has never been made clear before, the prostitution of the public service to the system of patronage.

Lenten Meditations

The Divine Companion

A desert. Far as the eye can see, a waste of sand. No house, nor tree, nor refuge from the hot sun in all the extended plain. Two figures—a boy and his mother: cruelly exiled from their former home by the father, at the demand of the jealous and more cruel wife; friendless, homeless, wanderers. The water in their gourd is spent; the boy lies by the side of a desert shrub, in the poor shelter which it furnishes from the burning sun, breathing out his life through parched lips. The mother sits weeping at a little distance, as it were a bow-shot, that she may not see him die. And close by his side, feeding the roots of the shrub, the secret of its life, is a hidden spring, the secret of his life also if he did but know it.

So, with infinite pathos, men lie dying close to the source of life and know it not. The Great Companion is by our side and we see him not. He speaks our name and we hear him not. Or, if we think of him as present, it is but to fear him—worst fate of all: to fear the Great Companion, the dearest and most patient Friend. As a child, frightened by its own dreams, repels the mother who would clasp it to her arms, and imagines her the monster whose shadowy form has terrified it, so we add to the terrors of our life by an unreasoning terror of Him who would give us courage to overcome at once our fears and our foes. We are afraid of the voice of God in the garden, and hide ourselves because we are naked and ashamed; we know not that He comes to clothe us.

"I will not leave you orphans." What is an orphan? One from whom the Father has departed. The son looks back across the years to the faded memory of a father gone; forward through the years to a dim hope of a father to be met again in the celestial land. But there is no father here, to counsel, to encourage, to inspire, to provide. Alas for the orphaned Christians who look back nineteen centuries to a time when God lived with men and talked to them; forward through the vista of the years to a distant time, in some other land than this, when they hope to see God face to face; but who are now

uncounseled, unencouraged, uninspired, unprovided! To such, God is a fading memory or a dim hope; they know not the Great Companion. They believe in him as the God of Abraham but not of Governor Bradford, the God of Moses but not of Lincoln, the God of David but not of Browning, the God of Paul but not of Phillips Brooks. They even have to reinforce their faith in a God that was and is to be, by theistic arguments, as if Hagar should argue that there must have been a spring of water once or the shrub could not have grown; and all the while she had but to scrape away the sand in order to find it there, a fountain of life for her and her child.

"I will pray the Father, and he shall give you another Companion, that he may abide with you forever; even the Spirit of truth; whom the world cannot receive because it seeth him not, neither knoweth him: but ye know him; for he dwelleth in you, and shall be with you."

God is not a vision: he is an experience. Call not this voice of conscience commanding "Thou shalt not," this voice of aspiration calling "Follow me," the voice of your better nature. It is the voice of the Divine Companion; it is the voice of Jehovah, the voice of Jesus Christ. Mount Sinai and the Mount of Beatitudes are both within our own souls. It is He who speaks to us. And we hear Him not. How can the gold-seeker in Alberich's cavern see the sunlight in which is life? How can the prisoner working in the mines hear the voice of the lark? Nay! how shall even Elijah, in the midst of the wind, the earthquake, and the fire, hear the still, small voice? We are called by many an exhortation to the strenuous life; and this is right. But if we are to live the strenuous life well and wisely, strongly and bravely, we need also the silent life. "Be still, and know that I am God."

Why should these wakeful hours in the night worry you? Why should you toss wearily on your bed? or rise and read, that you may banish wakefulness and recover sleep? These are the best hours of all the twenty-four, if you did but know it. So the Psalmist found them:

My soul shall be satisfied
As with marrow and fatness;
And my mouth shall praise thee
With joyful lips;
When I remember thee upon my bed,
And meditate on thee in the night watches.

The Great Companion is not dead; he is not departed. Cry not aloud; for he is not talking, nor pursuing, nor on a journey, nor sleeping, that he must be awaked. He is the living God. We need no argument to prove that He is; not more than do the fishes to prove the water in which they swim, or the flowers to prove the sunlight from which they take their colors and their fragrance. In Him we live and move and have our being. The world seeth Him not; but we see Him, because He lives and we also live.

The Department of Commerce

In the special interest which has attached to the anti-trust legislation, and the powers conferred by it upon the new Secretary of Commerce, the significance of the act creating the Department of Commerce, with a rank equal to that of the other Departments of Government, has been lost sight of. But it is significant of a very great revolution which has been accomplished in American public sentiment since the days of Jefferson. The object of this bill is in general terms well defined by President Roosevelt in his first message to Congress, in calling for the creation of such a Department. He says:

It should be the province of the head of such a department to deal with commerce in its broadest sense, including, among many other things, whatever concerns labor and all matters affecting the great business corporations and our merchant marine. The course proposed is one phase of what should be a comprehensive and far-reaching scheme of constructive statesmanship, for the purpose of broadening our markets, securing our business interests on a safe basis, and making firm our new position in the international industrial world, while scrupulously safeguarding the rights of wage-worker and capitalist, of investor and private citizen, so as to secure equity as between man and man in this republic.

The adoption by Congress of this recommendation is a distinct recognition of the fact that the Nation, *as a Nation*, has commercial interests, which it is the duty of the Federal Government to take cognizance of and protect and promote.

Roughly speaking, there are three

theories of government, which may be respectively designated as paternalism, individualism, and fraternalism. According to paternalism, it is the duty of one man or of a few best men in the community to take care of the interests of the many, as of the father to take care of the interests of his children. According to individualism, it is the duty of government to govern, and to do little or nothing else. When it has protected persons and property, and done a few absolutely necessary things, such as to provide a postal system for intercommunication and to build lighthouses to make harbors safe, its duty is ended. It must leave every individual to take care of his own interests, without interference from or supervision of government. Fraternalism is the theory that a community is a brotherhood; that it has common interests; that it may wisely by common action provide for these common interests; that governing, that is, protecting the natural rights of the individual, does not exhaust its powers nor fulfill its duties. It may therefore, *as a community*, provide education for all the children of the community; it may by legislation protect and promote industrial development by excluding foreign competition; it may, in the case of a city, provide, own, and if necessary operate the systems of lighting, water supply, and transportation; it may own and operate the telegraph as in England, or the railroads as in Germany, or the express business as in Switzerland.

The creation of a National Department of Commerce is a recognition of this principle of fraternalism applied to commerce; by it the Nation says to itself, We the people of the United States have industrial and commercial interests, which are other than and may be opposed to the real or supposed interests of the individuals who control and carry on the industries and the commerce of the country, and we propose to have an officer appointed to look after these interests of ours, and, in so far as it becomes necessary, we propose to make these individual interests subservient to the public welfare. Those who believe that the individualism of Jefferson is the final stage in political progress will look on this creation of a Department of Commerce with regret as perilous to individual liberty and individual progress. Those who, with The Outlook, believe in fraternalism will welcome the creation of a Department of Commerce, as a valuable and important recognition of a sound principle of political action and a wise and important step in our development toward a greater industrial and commercial homogeneity, and a subordination of purely egoistic and personal interests to those of the great body of the people. The President could not well have found a man better fitted to have charge of this experimental Department than Mr. Cortelyou, who as private secretary to President McKinley and President Roosevelt has shown rare ability as a judge of men, a power of sustained application to service that is remarkable, and sound judgment in public affairs. The appointment of Mr. James R. Garfield as the Commissioner of Corporations in the new Department is a deserved recognition of his effective work on the Civil Service Commission.

❀

The Better Way

Society has its moods of exaltation and depression precisely as individuals have such moods. Bad quarters-of-an-hour come to nations as they come to individual men and women, and from the same causes—some outgoing of energy, some decline of power, some sickness of mind or body, some great experience which for the moment benumbs or overwhelms. These moods of depression, although they are at times inevitable, ought always to be regarded as passing, as abnormal, and as unwholesome if one stays in them too long. Even the greatest sorrows have their lessons of strength and sweetness, and the man or woman who has real spiritual health sooner or later gets the strength and passes out of the depression.

The first half of the last century was in many respects a time of exaltation, of high hopefulness; the last half of it was a period of spiritual reaction and of the depression which comes from the decline of hope. This mood of hesitation, of doubt, sometimes of despair, has continued so long, has expressed itself through so many of the arts, has penetrated so much thinking and feeling, that a good many people have come to regard it as the normal attitude towards life.

Poetry and fiction have long been full of the misery, the uncertainties, the disappointments of life; fiction has dealt continually, though by no means exclusively, with the diseases of society and of men, with morbid passion, morbid psychology, morbid character in all its phases. The hard and apparently cruel side of nature has been emphasized in many ways by many writers, until many have come to believe that nature is a vast and heartless mechanism stained by blood and dominated by cruelty.

Commenting upon this impression conveyed by some writers on nature, President Eliot has said that the fact that such a notion should find acceptance to-day and make people miserable "only illustrates the curious liability of the human intelligence to sudden collapse;" and he adds this great and significant fact, which such people are constantly forgetting: "The great solid conviction which science within the past three centuries has enabled thinking men and women to settle down on is that all discovered and systematized knowledge is as nothing compared with the undiscovered, and that a boundless universe of unimagined facts and forces interpenetrates and encompasses what seems the universe to us. In spite of this impregnable conviction, people distress themselves because, forsooth, they cannot discern the moral purpose or complete spiritual intent of this dimly seen, fractional universe which is all we know. Why should they discern it?"

Professor William James, in one of his books, used a striking illustration of the misconception into which partial knowledge constantly leads men, and from which they would be delivered if they could go a single step further. He imagines the feelings of a dog who is laid on the vivisection-table and surrounded by surgeons who seem to him to be monsters of cruelty bent only on torture. If the dog could go a step further, he would know that the men who surround him are eager observers, trying to make discoveries in order to prevent and relieve the causes of pain. If it be true, as some people insist, that we have no right in any way to affirm the character of an unknown universe, then the pessimists are as illogical as the optimists. They have no more foundation for their gloom than cheerful souls have for their brightness; but with this immense difference, that pessimism is an intolerable working theory of life, while optimism is not only the most cheering and helpful theory of life, but it fosters and brings out the highest energy, noblest purposes, and the best spirit of men. Ultimate hope has its own foundations; but, to put it on the lowest basis, if one has to choose between hopes that he cannot demonstrate and fears that he cannot prove, it is wiser to go with one's hopes and turn one's back on one's fears.

The Impressions of a Careless Traveler

X.

April 24.

A QUIET day at sea; to-morrow we bring our yachting experiences to a close, bid good-by to the Prinzessin, and disembark at Naples for six weeks in Italy. This will be a good time to put down here one or two general impressions corncerning this trip, such as belong to no particular date or place. There is certainly a peculiar charm in this way of seeing the world. Our voyage has been so planned that we have generally sailed at night, arrived at our next port in the early morning, have had the day for sightseeing, have had our luncheon on shore, and have returned to the yacht in time to dress for dinner. That ocean travel sometimes grows monotonous for want of topics for conversation every ocean traveler recognizes. But since we entered the Mediterranean there has been no dearth of topics for conversation. We exchange with one another our views and experiences of the preceding shore excursion, get our neighbor's impression and fasten our own impression on our mind by giving him ours in turn. There is no lack of conversation in the smoking-room, the social hall, on deck, or at the dinner-table. We have a very pleasant contingent of passengers; since we left Genoa, where many Americans went on shore and

many Germans came on board, we have a little over a hundred Germans and a little less than fifty English and Americans. There is plenty of drinking—it is astonishing how much beer a German can consume—but no drunkenness: I believe others of our party one day saw two young men the worse for liquor, and I have seen some more as the result of a shore experience in Russia, but this is all; there is card-playing, but I have seen no gambling. I think it may be fairly said that we have no swells, no cads, and no bores on board; the "fast lot" are conspicuously absent. Since we entered the Mediterranean on the 24th day of March, a very pleasant feature of our life has been afternoon tea and coffee, served at a table on the promenade deck. Forty or fifty passengers, perhaps more, gather about the table about half-past four o'clock, and the informal gathering furnishes a very good occasion for making a new acquaintance or for brief, scrappy conversation with those already made. Ernest, the chief deck steward, presides at this table with the courtesy of a host, and serves his guests as though it were his delight, not merely his business. He is first on the deck in the morning, the last to leave it at night, is never ruffled, never hurried, never brusque, always affable. I wish I might hope to continue on shore some of the very pleasant acquaintances I have made on shipboard; but I am well aware that steamship fellow-passengers are "ships that pass in the night," and acquaintance formed on a steamer is generally sundered on disembarking. We have none of the worry of travel, no trunks to unpack and repack, no railroad time-tables to consult, no tickets to buy, no problems to solve respecting our accommodations at hotels, no perils to digestion in constant changes of diet and irregularity in meals. Our steamer is our home; to it we come every night as we would to our hotel on shore, and very welcome we find our home-coming. It is true that we often wish that our yacht would remain longer in port. I would have liked a full day more in Genoa, at least three days in Palermo, and I cannot tell how many would have contented me at Athens; but other of our passengers would probably have liked three days at Monte Carlo. If it were my private yacht, I could remain in any port as long as I chose; but I should certainly have a party of a dozen or twenty friends on board, and it would be impossible to suit them all; some would be impatient to go on, others would wonder why we sailed so soon. On the whole, I think I prefer the restfulness of being under orders to the responsibility of giving them. I am inclined to consider this an ideal way of seeing so much of the world as lies near to navigable waters.

I am thankful that I was endowed by nature with some sense of humor, for I have gotten a good deal of fun out of what otherwise would have driven me distracted. I have been the treasurer of our little party, and have had to keep accounts in nine different currencies: American, German, Portuguese, English, Italian, French, Turkish, Russian, and Greek. I hope our purser has also a sense of humor, for it is a part of his business to keep an exchange office for the whole ship's company, which he does with a good nature which nothing can disturb, and a promptitude of reckoning which is a perpetual surprise to me. The library steward, who sells postage-stamps and postal cards, takes with equal facility money from every land under the sun, and hands out the postage-stamp which is called for, quite indifferent whether the coinage offered is of the country which issues the postage-stamp requested. On board the boat I find employment for my leisure hours in reducing my cash account to one coinage, generally French, so as to distribute the expenditures correctly; but on shore this is more difficult. In Athens I went out in the evening to buy some oranges, inquired the price, had no idea of the meaning of the answer, took two oranges, handed out the smallest coin I had, fully expected to have the vender call for another, and, on the contrary, had him give me back half a dozen or more still smaller coins. I wonder what I really did pay for those oranges! In Italy the currency problem is further complicated by the fact that most of the currency is paper, that gold is at a premium, and that the premium is liable to change every day, so that one can never tell what is the purchasing power of his ten-lire gold piece nor what his ten-lire Italian note will be worth to him if he has one left over when he is ready to
